of the toughness and durability of the coating. The company also make panels in imitation of Sienna and Brocatel marbles, which are said to be absolutely natural imitations of the genuine stone. These marble finished patterns form very handsome wainscoting, walls and ceilings. The onyx ceilings are produced in panels with molding around the edge of each panel finished in a tint to correspond with the onyx and the relief work in the molding finished in gold, producing an exceedingly

The Sharon Tin Plate Mills.

A press dispatch states that the tin plate plant of the American Tin Plate Company, at Sharon, Pa., is to be removed to Columbus, Ohio. This is incorrect, for the reason that the American Tin Plate Company do not have a tin plate plant at Sharon, the mills at that place being owned by the Sharon Tin Plate Company, an affiliated interest of the Sharon Steel Company. We can state officially that the Sharon Tin Plate Company have no intention of removing their plant from Sharon to Columbus, or any other place. Ten mills have been in operation at these works for a long time, and ten more mills, which have been under construction for about a year, are nearly completed and will probably be started this month. The entire output of the Sharon Tin Plate Company is taken under a contract by the American Tin Plate Company at regular market prices, less a discount of 2 per cent. for cash.

Kenney's Patent Double Seamer.

The accompanying illustration shows a view of Kenney's patent double seamer for standing lock tin roofing, manufactured by the Dwight Slate Machine Company 512-516 Asylum street, Hartford, Conn. The machine consists of two clamps operated by long levers or handles. To one of these clamps is hinged a double, right angular faced folding bar operated by a foot lever. To work the machine the levers are opened, the clamps placed over the standing edge with the vertical face of the folding bar to the work and then closed and held firmly. By pressing down the foot lever the tin is turned a little below a right angle. The machine is then slipped along half its length and the operation repeated, the horizontal face of the folding bar completing $8\frac{1}{2}$ inches at each turn. Thus, two operations take place at each downward stroke of the foot lever. After going over the work once the gauges are raised and a second operation completes the double seam. It is pointed out by the manufacturers that the clamping arms take strong hold upon the work, preventing the machine from raising up

Kenney's Patent Double Seamer.

or drawing the tin, at the same time furnishing the workman with a direct hold upon the roof and a great degree of safety.

Where it is desired to double seam a roof of very steep pitch, the leverage is such as to enable the machine to be worked by hand. It will begin and finish a seam at either end of the roof, the operator standing in an erect position. These machines are adjustable to different widths of seam and qualities of tin. All parts are made to gauge, so that a duplicate part can be furnished at any time. The makers claim that this seamer will not break the tin, will make a more even and tight joint and save the labor of five or six men, as compared with the mallet system, while it is wholly within the range of a boy's work. The weight of the machine complete is 13 pounds.

On an order from the Freeman-Delamater Hardware Company, C. H. Bennett and J. H. Mayer of the firm

of Bennett & Mayer, 38 Congress street, West Detroit, Mich., performed the feat of making 800 joints of Stove Pipe in seven hours. A few figures will demonstrate the ground for claiming this as a feat. The time allotted to each Pipe was only $31\frac{1}{2}$ seconds, and each Pipe was put through five separate operations—namely, folding, forming, grooving, beading and crimping. This would allow but 6.3 seconds for each operation. The machines used were manufactured by the Niagara Machine & Tool Works of Buffalo, N. Y.

Canonsburg Steel & Iron Works.

The Canonsburg Steel & Iron Works, Canonsburg, Pa., have bought the property owned by the American Tin Plate Company at Canonsburg, Pa., and they propose to make additions and improvements to it which will necessitate a considerable outlay of money at once, but the works will be put in operation on or about the first of the year. The products will be fine steel and iron sheets for stamping and enameling purposes. The mill will be enlarged somewhat and the stamping works will be also equipped with new and modern machinery. The company have incorporated under the laws of Pennsylvania, with a capital stock of \$250,000. The officers are John F. Budke, president; John M. Watson, vice-president, and George Retberg, secretary. The report some time since that the plant had been dismantled is untrue.

The Centennial Rain Water Cut Off.

Cooney & Geiger, manufacturers of tinware, 19 and 21 East South street, Indianapolis, Ind., are now making their well-known Centennial rain water cut off out of galvanized iron to fit around corrugated pipe, as shown

The Centennial Rain Water Cut Off.

in the sectional view given herewith. This form of cut off is calculated to save time and labor, and it can be used with either vertical or horizontal pipe. This device is constructed of the best materials and is claimed to be unusually strong and durable. It can be used without extra pipe or elbows and is constructed with either right or left hand wire. The cut off is made in four sizes—2, 3, 4 and 5 inches in diameter.

Peck, Stow & Wilcox Company.

The annual meeting of the Peck, Stow & Wilcox Company, manufacturers of tinsmith's and other tools and general hardware, took place at the company's office in Southington, Conn., last week. The regular 2 per cent. quarterly dividend was declared, and in addition a special 3 per cent. dividend was paid. The Board of Directors was elected as follows: W. R. Walkley, S. H. Wilcox and M. C. Ogden of New York; Marcellus B. Wilcox and Marcus H. Holcomb of Southington; Frank L. Wilcox of Berlin, Conn., and A. R. Treadway, L. H. Treadway and S. W. Sessions of Cleveland. The directors organized with the election of A. R. Treadway, president; Frank L. Wilcox, vice-president; Edwin N. Walkley, secretary, and Stephen H. Walkley, treasurer.

The company operate plants in Southington, Plantsville, Berlin and Cleveland. Recently the company have purchased and added to their Cleveland interests the Brittain & Mathew lock works of Pittsburgh. It is understood also that the company's Southington factory will be considerably expanded this year, and that new lines of manufacture will be added.

The Niagara Power Groover.

The Niagara power groover, shown in the accompanying illustration, is intended for grooving and closing the longitudinal seams in sheet metal cylinders, &c., made of iron up to No. 22 gauge. The traveling carriage has two rollers, one for grooving and the other for flattening the seam. The grooving horn is $2\frac{3}{4}$ inches in diameter and is reversible, so that either the flat surface or one of the grooves that are planed into the horn can be turned upward. Outside grooving is done in the usual manner by using the grooved wheel on the carriage and the seam is put toward the inside of the work by having flat rolls on the carriage, which press the seam into one of the grooves planed into the horn. The grooving and flattening rolls can be adjusted independently to suit the thickness of the material. A stop is provided at the outer end to prevent the work from slipping off the horn while being grooved. This stop is adjustable for work of various lengths. A guide is attached to the traveling carriage to hold the lock in posi-

The Niagara Power Groover.

tion laterally. The traveling head of the groover is moved by means of a sprocket chain.

It is pointed out by the manufacturers, the Niagara Machine & Tool Works, Buffalo, N. Y., that the movable rack used on some power groovers is objectionable, as it necessitates a floor space of twice the working length of the machine. By closing the latch that connects the grooving horn with the upper bar, the operator starts the traveling carriage, which will pass over the work, return to its original position and then stop automatically. The operator can stop the motion of the traveling carriage during the forward movement at any point by means of a hand lever. The traveling carriage opens the end latch before starting on the return trip, during which time the rolls clear the material to give the operator a chance to remove the finished work and to get the next piece ready. Three grooved rolls, 5-16, 7-16 and 9-16 inch respectively, and two flattening rolls are supplied with each machine.

New Black Plate Process.

For some time the American Tin Plate Company have had under construction at their Monongahela Works, South Side, Pittsburgh, some machinery for the rolling of black plate under an entirely new process. The details of this process have not been made public, but it is said that if it proves to be as successful as anticipated it will completely revolutionize present methods of manufacture of tin plate, particularly as regards the black plate rolling. Under the present Amalgamated scale the cost of rolling black plate is about \$12 a ton, and it is the aim of this new process to very considerably reduce this admittedly excessive cost. The new machinery is expected to be finished in September, when the rolling of black plate will be commenced. If the

process is successful it is the intention of the American Tin Plate Company to equip their principal plants with the improved machinery.

THE TIN PLATE VOTE.

Although voting is still going on among the lodges of the Amalgamated Association of Iron, Steel and Tin Workers on the question of accepting the reduction in wages to permit the American Tin Plate Company to secure the business of the Standard Oil Company, the reports already published make it practically certain that the proposal will be rejected by a large majority of the members of the association. It is claimed that a majority of the workmen in the State of Ohio are in favor of accepting the reduction, but those at New Castle, Pa., and Elwood, Ind., are said to be practically a unit in opposition to the reduction. President Theodore A. Shaffer has been visiting all the principal plants of the American Tin Plate Company and urging the men to accept the proposed cut, which he believes will accrue to their benefit in the end. In the proposition, as laid before the workmen, it is explained that in order to secure the trade now going abroad, amounting to about 1,500,000 boxes annually, a wage reduction of 25 per cent. would be necessary on all plates rolled to replace drawback plates. The general wage reduction, however, would not be more than $3\frac{1}{2}$ per cent., and as the production would be increased fully $16\frac{1}{2}$ per cent., the average earnings of the workers would be increased about $12\frac{1}{2}$ per cent.

It is said that the fact that the securing of the business of the Standard Oil Company and some of the large packers, which now goes to South Wales, would take away their employment from many of the Welsh workmen, has induced numbers of the Welsh tin plate workers in this country to vote against accepting the offer. However that may be, it appears to be pretty clear that the proposed wage reduction, in its present form, at least, will be rejected by the Amalgamated Association as a body. Should they not be able to secure this foreign business the American Tin Plate Company, having accumulated considerable stocks at their mills, will undoubtedly be forced to close down a number of their plants. Already this closing down has begun. The largest of the company's plants, the Shenango works at New Castle, Pa., has been shut down indefinitely; also the two plants at New Kensington, Pa., and several in Indiana. All the nonunion plants of the company are said to be in full operation.

FLASHINGS.

THE BUFFALO FORGE COMPANY, Buffalo, N. Y., advise us that the demand for their Buffalo Improved Ventilators has been so great that the supply of their previous catalogue relating to this device has been exhausted, and they have been compelled to get out a new one. The new issue, just received, is in the form of a neat booklet of 16 pages, bound in a cover of attractive design. The typical features of the Buffalo Improved Ventilators are dwelt upon in the introduction, and details are presented describing the principle upon which they are constructed. Half-tone cuts show various forms of these Ventilators adapted for different requirements, some with glass tops and others without illumination. Cuts are also given showing the method of fastening the ventilators to the roof. The last few pages of the catalogue contain illustrations of the company's Disk Ventilating Wheels, Buffalo Blowers and Exhausters and Stationary and Portable Forges.

THEODORE OLIVER, Easton, Pa., has sold his Sheet Iron plant to the Jackson Foundry Company of Philadelphia. The plant consists of a double puddling furnace and a train of 22-inch Sheet mills. It is understood that the plant will be placed in operation shortly.

THE capital stock of the Pope Tin Plate Company of Pittsburgh, with Tin Plate mill at Steubenville, Ohio, has been increased \$500,000 to \$750,000. It is expected that their entire works will be completed and in full operation within 60 days.

RICHARD GARLICK has been made auditor of the Youngstown Iron Sheet & Tube Company, Youngstown, Ohio, succeeding W. C. Reilly, recently appointed general superintendent. Mr. Garlick is also treasurer of the concern.

WE are advised that no improvements are under contemplation at the present time at the Falcon Works of the American Sheet Steel Company, Niles, Ohio. This plant is now idle, with no prospects of early resumption.

BERTSCH & Co., Cambridge City, Ind., manufacturers of Shears, Punches and Bending Rolls, report business the best in the history of the firm, with enough orders ahead to keep them running for several months. They have just shipped a 102-inch improved Hydraulic Plate Shears weighing 50 tons, for 1¼-inch Plates, to the Lukens Iron & Steel Company, Coatesville, Pa.

THE GLOBE MACHINE & STAMPING COMPANY, 970-972 Hamilton street, Cleveland, Ohio, have during the past month increased their capacity considerably by the installation of a number of new tools. They report on hand as many orders as they can take care of, among which are a number for drop forging dies and punching and forming dies for Sheet Metal work. Fred. G. Nicalous, formerly with the Browning Engineering Company, and later with the National Stove & Illuminating Company, has interested himself with the Globe Machine & Stamping Company and is now their superintendent.

THE new Tube, Skelp and Sheet mills of the Sharon Steel Company at Sharon, Pa., are being erected as fast as possible, but will not be in operation before about December 1. The Sheet mill will have an annual output of about 35,000 tons and will contain ten mills, ten Sheet furnaces, ten pair furnaces and four annealing furnaces. There will also be a galvanizing plant connected with the Sheet mill.

THE FULMER WIRE SNOW GUARD is a new device manufactured and patented by J. H. Fulmer, Nazareth, Pa. The special feature of the Guard is that it is made of double strength where the greatest strain comes. It is claimed that it will not break the slate. Mr. Fulmer is also the manufacturer of a line of Slater's Tools.

MEURER BROTHERS, Brooklyn, N. Y., are calling special attention to their leading brands of guaranteed Roofing Tin, which have obtained a wide reputation for the firm. These include Meurer's Genuine Tinned Iron Charcoal Sheets, made in the style used half a century ago, Meurer's Old Method, Meurer's Roofing, Flushing and Pullman.

THE STARK ROLLING MILL COMPANY, Canton, Ohio, announce that their plant is now in full operation. The company make a specialty of Galvanized Sheets and Fine Steel Sheets for stamping and electric work.

THE FALKENAU-SINCLAIR MACHINE COMPANY of Philadelphia have been formed by the consolidation of the Philadelphia Machine Tool Company and A. Falkenau of that city, the plant of the first named company being removed to 109 to 115 North Twenty-second street. The new company have taken over the entire plant and business of both of the above named concerns, and the largely increased facilities secured will enable them to give prompter service and at the same time maintain the reputation for workmanship in their Machine Tools they have hitherto enjoyed. The company, among other products, manufacture Presses and Shears, Curved Molding Machines, Cornice Presses, &c.

STEARNS HARDWARE COMPANY, Port Arthur, Texas, have been incorporated with a capital stock of \$25,000 to carry on the wholesale and retail business in Stoves, Tinware, Shelf and Heavy Hardware. The officers of the company are Geo. R. Stearns, president; S. R. Hogaboom, vice-president and general manager; J. C. Reynolds, secretary, and Chas. F. Ashley, treasurer.

Death of Christian Off.

Christian Off, senior member of the firm of Christian Off & Co., tanners and galvanized iron workers, 434 East Washington street, Indianapolis, Ind., died of apoplexy on July 25, at his home, 535 North Noble street, Indianapolis. Mr. Off was a well-known and highly respected citizen of Indianapolis and his firm was one of the pioneer business houses of that city. He was born in Wurtemberg, Germany, in 1835, and came to this country at the age of 17 years. In 1854 he went to Indianapolis and occupied himself in various business lines, subsequently organizing the Capital City Planing Mill. Leaving the lumber business Mr. Off opened up a stove store and then branched out in the tinware and tinsmithing business. In the last few years the attention of the concern was devoted more to the tin and galvanized iron trade. Mr. Off leaves a widow and seven children, his eldest son, William F. Off, being the surviving member of his business firm. The deceased was prominently identified with many of the German societies of the city and had served several years as a member of the City Council.

The Liberty Lantern.

William Vogel & Brothers, 37 to 47 South Ninth street, Brooklyn, N. Y., are manufacturing and placing on the market the new Liberty lantern, of which we give an illustration. The points of merit claimed by the makers for this lantern are the easy lift and the fact that the combustion is perfect, while the light is un-

The Liberty Lantern.

usually strong and steady and cannot be blown out or extinguished by shaking or jarring. The lift, which is a special device of these manufacturers, has a positive lock on both top and bottom and is very simple in operation. The lantern is of the best possible materials and workmanship and is claimed by the makers to be the acme of excellence in its field.

UNION HARDWARE COMPANY, Arkansas City, Kan., have changed their style to the Hamilton Hardware Company and increased their capital stock from \$5000 to \$10,000. The company are retailers of Stoves, Shelf and Heavy Hardware and Tinware. There is also a department devoted to plumbing.

N. W. DEERING & Son have succeeded G. H. Thornley in the Stove, Hardware and Tinware business in Atlantic, Iowa. Mr. Deering was identified with the Hardware business in Iowa 20 years ago, but went to Florida in 1888, opening a store in Quincy of that State. This business was disposed of to Trulack Bros. in the early part of the present year.

THE EASTERN TRADE GOLF ASSOCIATION.

A commendable effort is being made to cultivate cordial relations among men who are engaged in the plumbing and heating goods trade by the organization of a Trade Golf Association in the East, where the members can meet under relaxation from business cares, the social side be developed and acquaintances formed that cannot but have a beneficial effect among tradesmen. The following letter sent out from the headquarters of the association, at 1123 Broadway, New York City, by the secretary, H. A. Smith, gives the result of the first meeting and notice of the date of the next meeting will be given in due season when finally determined:

Last year a Trade Golf Association was formed in the West, which has been most successful. Several tournaments have been held at which creditable prizes were offered for competition, and much good playing and good fellowship have resulted. The membership is confined to firms manufacturing and jobbing plumbing and heating goods.

A number of Eastern supply men having attended the Western meetings, and others having heard about them, it has been under consideration for some time to form a similar association in the East. This was done August 1, the meeting being held at "The Arena," Thirty-first street and Broadway, New York. An organization was formed as follows:

OFFICERS:

President, Chas. H. Simmons, John Simmons Company, New York.
Vice-president, C. W. Woodward, secretary Association of Manufacturers and Jobbers of Plumbing Supplies, New York.
Treasurer, Frank C. McLain, New York.
Secretary, H. A. Smith, *Engineering Review*, New York.

BOARD OF GOVERNORS:

P. R. Jennings, Bruce & Cook, New York.
Henry Aird, Aird-Don Company, Troy, N. Y.
W. H. Thayer, Smith & Thayer Company, Boston.
E. C. Molby, Pierce, Butler & Pierce Mfg. Company, New York.

MEMBERS:

A. Fowle, Jr., Central Foundry Company, New York.
F. C. Jennings, Bruce & Cook, New York.
H. E. Adams, Adams & Jones Company, Boston.
T. G. Haywood, the Richmond Company, Norwich, Conn.
F. T. Bassett, American Radiator Company, Boston.
H. Hovey, Prizer-Painter Stove & Heater Company, Reading, Pa.
F. W. Smith, U. S. Radiator Company, Dunkirk, N. Y.
H. S. Martin, U. S. Radiator Company, Dunkirk, N. Y.
W. S. Appleton, U. S. Radiator Company, New York.
W. L. Herendeen, Herendeen Mfg. Company, Geneva, N. Y.
R. D. Reed, H. B. Smith Company, Westfield, Mass.
J. F. Kernan, Syracuse Stove Works, New York.
J. C. Faulkner, H. B. Smith Company, New York.
F. C. Sullivan, Henry Huber Company, New York.
F. C. Barrett, Pierce, Butler & Pierce Mfg. Company, New York.
Frank K. Chew, *The Metal Worker*, New York.

The office of Captain was left vacant, also three places on the Board of Governors. These will be filled at the next meeting, which will probably be held at "The Arena" on August 15. The initiation is \$2, annual dues \$1; all payable in advance.

It is intended to hold the first tournament September 9, the day preceding the fall meeting of the Association of Manufacturers and Jobbers of Plumbing Supplies, on grounds to be selected by the Board of Governors. The prizes will be announced later.

I inclose herewith membership blank and hope to receive your application by early mail. The experience in the West has shown that such an organization conduces to social enjoyment, healthful recreation and valuable business acquaintance.

Gas Governors.

An appliance that should appear in every acetylene plant of fair size, says the *Plumber and Decorator* of London, is a governor. It is a source of economy even with coal-gas, which is served from a company's mains and already "governed" at the works. With an acetylene plant the gas works is at home, and to have no pressure-governing appliance or means of automatic control between the gas works and the burners is wrong. It is probable that the governor has been omitted even more than the purifier, and, in consequence, there have been annoying results, waste and other things tending to the condemnation of acetylene. A generator for general purposes usually stores the gas in the holder at about 6 to 10 inches pressure of water. The holder-bell, if of stout metal, will cause an 8 to 10 inch pressure unless it is counterbalanced, and this latter is unnecessary if the bell is not loaded in any way. The pressure at the

burners, for the best flame and economical results, varies from 2 to 4 inches (for 20 to 50 candlepower burners), and to have an 8-inch pressure behind a 20 candlepower burner means a waste of gas unless the bracket tap is carefully adjusted. As servants never do adjust gas taps carefully the waste is certain to occur. A governor obviates this, as it governs the pressure to whatever it is set to do, and this pressure will be at every burner, whether one or many be open, and will not vary. The governor should be considered essential.

BOILERS AND RADIATORS.

This branch of trade, both wholesale and retail, is to be congratulated on the business of the year, as shown by the universally favorable reports from all sections. July is said to have shown a larger volume of trade, so far as the sale of boilers is concerned, than has ever before been done in that month, starting the second half of the year on the same basis that the first half has maintained. A most pleasant feature of the boiler trade so far this year is the preponderance of orders for the larger sizes and better class of boilers. This indicates satisfactory heating systems and economical fuel consumption. It also reflects a wise selling canvass by those who direct this work and is evidence of consideration by architects, builders and others of the sound, sensible information to the effect that an ample boiler capacity is a good investment in a heating plant. The sale of the smaller and less economical boilers is a menace to the best interests of the trade. It not only prevents the sale of more profitable goods, but the use of apparatus that must be run hard to do its work not only is extravagant in the use of fuel but also brings adverse criticism upon the whole boiler trade. Consequently it is pleasing to note in the extended sale of the larger and better boilers a movement in the right direction that cannot but bring increased prestige to this method of heating.

The increased sales also reflect the alertness of the buyers to the conditions which have previously been clearly outlined in *The Metal Worker* and which have led to the wise conclusion that an early advance in prices was naturally to be expected. The continuance of the conditions prevailing in the prices of pig iron, labor and supplies, with no indication of softening, has had the expected effect on the excellent policy that has been maintained for several months by the manufacturers. The effort to agree upon a price at the first of the year and maintain it through the year has not been without its benefits, even though a change has been made necessary by uncontrollable conditions. Most of the estimates made by steam fitters early in the year have been accepted and the necessary orders placed so that the steam fitter is protected while those who have bids out should withdraw them at once or give a notice of an advance sufficient to cover the advance in the price of the boilers that was found necessary by the manufacturers at a meeting held during the week. This advance was thoroughly discussed and the cost of production, which is the only sound basis on which to fix a selling price, justifies the increase that was finally agreed upon, although it was about half of what was desired by some. As the probability of this advance was so generally understood it was practically discounted by the contractors and will cause no hardship to those who used ordinary foresight.

Although no advance is reported in the price of radiation, it is difficult, in view of the prevailing cost conditions, to see how manufacturers can continue to maintain the old prices in this line of their product, valuable as the policy so tenaciously held to in the interest of the trade, of maintaining a stable market, may seem to be.

THE BARSTOW STOVE COMPANY, Boston, Mass., are calling the attention of the trade to their Bay State Hot Water Heaters, a novel form of Heater made especially for use in Bay State Furnaces when it is desired to heat additional rooms by hot water. These Heaters can also be fitted into any other Furnace having a fire chamber of proper size. They are made in four sizes of capacities ranging from 125 feet to 550 feet.

THE VACUUM SYSTEM OF STEAM HEATING.

While the advantages of a vacuum in radiators for assistance in distributing steam through a steam heating system have been recognized for many years, it was only recently that any effort was made to adapt these advantages to steam heating apparatus of all kinds. It is claimed that the trade generally have thoroughly mastered the installation of successfully working one and two pipe steam heating systems, and the progressive members of the trade are now making a study of the merits of the various exhaust, vapor and vacuum systems of steam heating. Those who are not near the large centers, however, do not have the same opportunity for securing information possessed by their more fortunately located competitors, and they, as well as many others, will be interested in the accompanying illustration of the apparatus used by the James A. Trane Vacuum Company of 40 Dearborn street, Chicago, which has recently been exhibited, in the interests of the manufacturers, at the showrooms of the Judson A. Goodrich Company, 105 Beekman street, New York City, by E. P. Allen of the Norwall Mfg. Company of Chicago.

In order that the principle and operation of the vacuum system may be seen and understood, the boiler, radiator, the Norwall air valve and the Trane mercury seal have been connected so as to work under exactly the same conditions as obtain in a regular steam heating plant. The boiler consists of a glass cylinder and two dome shaped heads of brass, brass connecting rods being used for securing the heads to the glass cylinder, and tight joints being made by means of packing. The bottom dome affords what might be termed a combustion chamber, into which the flame from the gas burner located beneath it plays as against a crown sheet and the heating surface of a boiler. The glass cylinder enables the water line and the movement of the boiling water to be readily seen. From the top dome a steam main on the one-pipe principle is carried to a radiator made of sheet brass. Connected with the dome of the boiler is a thermometer, which shows the temperature of the vapor arising from the boiling water. A compound pressure and vacuum gauge is also attached. At the last column of the radiator a Norwall automatic float air valve is placed, a pipe being carried up from it and connected with a glass tube, which extends down into a bottle of mercury, representing the Trane mercury seal, resting on the table beside the boiler.

On lighting the gas in the burner the water in the boiler soon begins to boil, and as a pressure of steam is generated the air is expelled from the radiator ahead of the steam, until the steam reaches the air valve, which at once closes and prevents the escape of steam, in exactly the same way as the air is expelled from the heating system in a building. The air which has passed from the radiator and through the air valve goes down the glass tube and bubbles out through the mercury in the bottle, or, in a working system, in the Trane mercury seal, a patented device specially constructed for the purpose. The advantage of a vacuum steam heating system can now be seen, for when the gas burner is removed or turned down to a low flame the water, being subject to a vacuum through the condensation of the steam in the radiator, continues to boil. As the temperature of the water decreases the tendency toward a vacuum increases and the mercury rises from the bottle, or from the Trane mercury seal, up into the glass tube or air pipe, so that it is not uncommon for working systems to carry a vacuum of 20 inches when the water in the boiler is boiling, although the temperature is but slightly above 160 degrees.

From this it will be readily seen that a heating system in a building equipped with a practical working vacuum system has very much the same range of temperature in the radiator that is available in a hot water heating system. The claim is made that vacuum heating plants have been working with the water in the boiler at as low a temperature as 120 degrees, and no difficulty is experienced in operating plants under a temperature of less than 150 degrees. This demon-

strates that instead of burning the fuel that would be necessary to keep the water at 212 degrees, or above, and generating steam under slight pressure, very much less coal is needed to keep the water in the boiler at any temperature—180, 160 or 140 degrees—below this point, bringing in the large saving in fuel that the advocates of the vacuum system of steam heating claim for their apparatus.

The Trane vacuum seal can be applied to every individual radiator on a heating system, or the air pipes from all the radiators can be connected into one pipe leading into a Trane mercury seal, located advantageously for the purpose. After all the air in the system has been expelled through the air valves and has bubbled out through the mercury seal the tendency toward a vacuum will lift the mercury in the air pipe and prevent the entrance of air. The height of the mercury column and the amount of the vacuum are governed entirely by the firing of the boiler. A low fire gives a high vacuum and low temperature of water, which is

The Vacuum System of Steam Heating.

well adapted for the heating of buildings in the early fall and late spring, while during the winter season the higher firing will reduce the vacuum and increase the temperature of the water until steam is generated under a pressure, as is customary with low pressure steam heating plants, with the attendant higher temperature of the steam in the radiators.

The picture shows the little model working under a vacuum of 17 inches, with the mercury in the thermometer indicating a temperature of about 170 degrees. The height of the mercury in the glass tube corresponds in inches on a 2-foot rule with the indication on the vacuum gauge, although the temperature, as registered by the thermometer, varies, owing to the fact that the bulb of the thermometer does not extend down into the water, which accounts for the discrepancy between the actual temperature registered and what it would be if the conditions were perfect.

One of the features essential to the success of a vacuum system is a good air valve. Between the glass boiler and the mercury seal on the table a little nickel plated boiler is shown, operated by an alcohol lamp, to which is attached a pressure gauge and a pipe connected with a Norwall valve. The sensitiveness of this valve and the quickness of its operation are shown after steam is gotten up in the little boiler, by touching the

surface of the valve with a cold wet towel, when the valve will immediately open and allow the steam to escape.

On the table below this boiler is a little glass tube, open at the top, connected by means of a slender pipe with the glass globe. In the glass tube is a float similar to that used in an actual valve. This little device is used to demonstrate the action of the air valve. After partially filling the tube with water the float is dropped into it. This has the effect of compressing the air in the ball. By holding a lighted match on the outside of the glass ball the air in it will expand and a large portion of it will be expelled through the water. The air in expanding will force the water to rise in the tube and carry the float up with it. As long as heat is applied to the glass globe the float will continue at a high point, exactly the same as steam from a radiator entering the upper portion of the Norwall air valve forces the water to enter the interior chamber of the valve and raises the float so as to bring the valve point to its seat and prevent the further escape of steam or the entrance of air. Just as soon as a wet towel or other cool substance is applied to the glass globe the air in it will contract and allow the water to flow down in the tube and rise in the ball to fill the place that has been occupied by the expanded air. As the water falls in the outer tube the float drops in the valve under the same conditions and opens the valve for the entrance of air.

The simplicity of the operation of these devices assures their successful operation, provided the workmanship and material used in the construction of the various details of the apparatus are of a high grade, and these, both the James A. Trane Vacuum Heating Company and the Norwall Mfg. Company claim, are being maintained at the highest possible grade, to insure the satisfaction of their devices, as they depend on satisfactory operation to establish their popularity and create a demand. Catalogues giving full particulars of the devices can be secured by correspondence with either of these companies at 40 Dearborn street, Chicago. The model shown in our illustration was on exhibition at the office of the Judson A. Goodrich Company from July 22 to 28, and was examined by many of the leading men in the heating trade in New York and vicinity.

Where Buffalo Fans and Engines Go.

The products of the Buffalo Forge Company of Buffalo, N. Y., are in steady demand, not only throughout the United States, but also in European countries. The company gives the following list of a few of the orders recently received through their different branch houses, which give some idea of where their goods go:

Two 70-inch steel plate steam fans, for heating and ventilating, direct connected to two Buffalo Forge Company engines, and one 130-inch $\frac{3}{4}$ housing standard steel plate pulley fan for mechanical draft, are to be shipped to Copenhagen, Denmark; one induced draft plant and one 23 horse-power engine for an electric light plant in Dutch Gulana, South America; five Buffalo engines of 45 horse-power each for driving generators, and one 38 horse-power engine for a pumping equipment to be installed in a sugar factory now being built near Manzanillo, Cuba; a 20 horse-power Buffalo vertical class "A" engine, to be shipped to Gustemunde, Germany; a 60-inch standard steel plate fan for ventilation, to be shipped near Glasgow, Scotland; a 140-inch steel plate fan with heaters complete for heating and ventilation, to Barrow-in-Furness, England; one standard 80-inch fan and heater complete, one 90-inch pulley fan for ventilation, and one 30 horse-power horizontal Buffalo engine, to London, England; one 120-inch fan and six 60-inch fans, to Manchester, England; an 80-inch standard steel plate fan for mechanical draft, to Victoria, British Columbia; a 110-inch steel plate pulley fan direct connected to a cylinder above shaft Buffalo engine for mechanical draft, to Halifax, Nova Scotia; one 70-inch fan and one 100-inch fan for heating and ventilating purposes, to Portland, Ore.; a standard 40-inch steel plate fan, to College Station, Texas; a 100-inch steel plate fan direct connected to a Buffalo single vertical

engine, to San Francisco, Cal.; two special 60-inch steel plate fans, to New Orleans, La., and a 25 horse-power horizontal Buffalo engine, to Gretna, La.

ANNUAL MEETING OF THE INTERNATIONAL ACETYLENE ASSOCIATION.

The announcement is made that the annual meeting of the International Acetylene Association will be held in the assembly room of the John Crerar Library, Washington street and Wabash avenue, Chicago, on August 11, 12 and 13. The meeting will be largely devoted to the reading and discussion of papers by members. Among the subjects to be treated are the following:

"Foreign Acetylene Associations and Their Work," by Elias A. Long.

"Acetylene Progress on the Pacific Coast," by Percy W. Rochester, San Francisco.

"Town Lighting from Automatic Generators," by W. W. Turner.

"A Review of the Burner Situation," by J. B. Carroll, Chicago; M. Kirchberger, New York; H. B. Shafer, Rochester, N. Y., and R. B. Stewart, Chattanooga.

"Acetylene Wrinkles," by C. E. Ummach.

"Car Lighting from Independent Acetylene Generators," by E. P. Caldwell.

"Acetylene Possibilities at the Louisiana Purchase Exposition," by A. E. Schlieder, Omaha, Neb.

"Recent Developments in the Use of Acetylene Under Pressure," by J. M. Morehead.

"Insurance as Related to the Acetylene Generator Manufacturer," by L. J. Wing, New York.

Question Box, in charge of W. H. Drake, Cleveland.

Purification and Its Real Value.

Meters and Their Use to Promote Business.

Special applications of Acetylene.

Lighting Country Homes.

The demand for all the conveniences of the larger cities in the residences of those who live in the suburbs has led to the production of special apparatus to meet these requirements. Not the least important among these requirements is that for a lighting system. The Gilbert & Barker Mfg. Company of Springfield, Mass., and 82 John street, New York, have issued a 106-page work entitled "How Best to Heat Our Country Homes and Resorts," devoted to the Springfield gas machine. This machine consists of a gas generator and cylinder containing evaporating pans and an automatic air forcing apparatus. The generator may be placed in a cellar or in the ground, and when filled with gasoline it is only necessary to operate the air pump to facilitate the generation of gas and cause its distribution through the piping to the burners providing the light. The gas generated by this process is also adapted for cooking and heating apparatus. The catalogue is illustrated with broken views showing the apparatus in detail and its application in use. Sectional views are also given illustrating the construction and internal arrangement of the various appliances. More than 70 pages are devoted to half-tone engravings of colleges, halls, churches, hotels and large country houses that are lighted by the Springfield gas machines. These are accompanied by testimonial letters from those who have used them in all sections of the country.

WILLIAM MALLIN, a colored plumber, with a shop in Marletta, Pa., is with the State troops at Shenandoah, Pa., as brigade headquarters' man to General Gobin. His genial and jolly ways have made him many friends among those whose business takes them to the headquarters. He has served in the Pennsylvania Guard for five years as brigade headquarters' man. During the Spanish War he was regimental headquarters' man for Col. D. D. Case of the Fourth Pennsylvania, seeing service in Porto Rico, and was afterward assigned to the Twenty-ninth Georgia at Fort McPherson. Mallin claims to have contracts for plumbing eight houses in his town and says that he gets most of his work from the white population.

PIPING MATERIALS FOR STEAM PLANTS.*

IN TWO PARTS. PART I.

Designing a system of steam piping is properly the province of the professional mechanical engineer. The manufacturer is interested in the design only so far as it may adversely affect his product. He has, however, a vital interest in the quality and type of the materials specified, as in the event of failure of any part of the system he usually bears the lion's share of the blame.

It is obvious that the manufacturer of any article whatever should have a knowledge of service conditions if he is to attempt to fulfill such conditions satisfactorily. Having such knowledge, it becomes necessary, when designing valves, fittings or other steam appliances, to draw upon the usual sources of engineering information as to strength of material, &c., supplementing this by a broad series of shop tests to determine whether the theoretical information is borne out by facts. It is one thing to think you are right and quite another to know you are right because you have demonstrated it.

The Crane Company have carried on a series of such tests for several years, principally covering the field of high pressure steam piping, and as briefly as possible I will give you the results:

PIPE.

Ordinary commercial pipe, 12 inches and smaller, appears to have an ultimate bursting strength in excess of 1500 pounds per square inch, provided the weld is perfect. We have tested some lengths of 10-inch pipe taken at random out of stock to 2300 pounds per square inch, 8-inch to 2000 pounds, 12-inch to 1500 pounds, 16-inch $\frac{3}{8}$ inch thick to 800 pounds, 24-inch $\frac{3}{8}$ inch thick to 600 pounds, all without rupture or apparent distortion. We have tested from time to time thousands of pieces of all sizes, 20 inches and smaller, under 800 pounds per square inch, so that as far as strength is concerned, there appears to be no reason why pipe heavier than standard should be used on power plant work. In plants where the feed water is bad, it is economy to run the feed lines of extra strong pipe, and this has become quite a common practice even where the water is comparatively good.

FLANGED JOINTS.

We have had occasion to make nearly every possible style of joint, but the major portion of our orders are for either screwed or shrunk flanges, in the proportion of about 85 per cent. screwed to 15 per cent. shrunk. Considering everything—first cost, ease with which a line can be altered or repaired, freedom from troublesome leaks and strength against tensile strain—we think a good screwed joint is superior to any other. We use two lengths of threads, the standard up to 125 pounds and a somewhat longer full taper thread for pressures up to 250 pounds. They compare as follows:

	Standard. Inches.	Extra heavy. Inches.
4-inch length.....	1 3-16	1 $\frac{3}{4}$
6-inch ".....	1 7-16	2
8-inch ".....	1 $\frac{1}{2}$	2 1-16
12-inch ".....	2 1-16	2 9-16
16-inch ".....	2 7-16	2 $\frac{3}{4}$
20-inch ".....	2 $\frac{3}{4}$	3 $\frac{1}{4}$

To determine the holding power of threads we made a large number of test, commencing with the long threads and gradually cutting them away. Results showed that the strength of the joint was limited by the strength of the cast iron flange. In no case was the thread stripped. On a 10-inch pipe the threads were reduced until barely five threads were in contact instead of 14, as called for by our standard tables. On the test the flanges broke at 650 pounds per square inch, all threads being intact. This question of the holding power of threads is one that we frequently have to explain, as some people are under the impression that under high pressure the threads are likely to strip. A calculation of the amount of metal which would have to be sheared off before the joint parted will effectually still any fears in this direction. Taking, for example, our

standard length of thread, eight threads per inch, the result works out as follows:

Size.	Length of threads. Inches.	Metal in contact. Square inches.	Sectional area of full weight pipe. Square inches.
8 inches.....	1 $\frac{1}{2}$	42	8.396
12 inches.....	2 1-16	77	14.579
16 $\frac{3}{8}$ inches.....	2 7-16	116	18.41

If we assume that the shearing strength is one-half of the tensile, then it is evident that the holding power of the threads is fully three times greater than the ultimate strength of the pipe. R. T. Crane had a great number of tests made upon runs of 8-inch pipe, using regular wrought iron couplings, for the purpose of demonstrating that long threads were not essential to strength. The final test was made with threads only $\frac{3}{4}$ inch long, barely six threads being in contact. The pipe was tested to 1000 pounds per square inch, the pressure being held on the line for a day. If one did not stop to consider the subject carefully it would certainly look extremely dangerous to carry 1000 pounds on a line with only half the usual number of threads, but as a matter of fact there were about 20 square inches of metal in the threads, against 8.396 in the pipe, and the joints were strong enough to carry the line to the limit of its bursting strength.

The object in making threaded joints for high pressure work longer than standard is not to gain greater tensile strength, but to reinforce the pipe by a deep hub and by throwing a large number of threads into contact to guard against the flanges being loosened by the continual vibrations of a high pressure line.

PIPE SHOULD BE SCREWED THROUGH THE FLANGE.

It is important to have the pipe screwed completely through the flange, first to guard against the vibration, and second to make a bearing for the gasket upon the end of the pipe and close the thread against the oxidizing action of the steam.

It is our practice to screw the flange on with power, until the ends of the pipe project about 1-16 inch. The piece of pipe is then swung in a special lathe and the projecting ends cut off, a light cut being then taken on the face of each flange to insure them being parallel and at right angles to the true longitudinal axis of the pipe. This refacing operation is absolutely essential to a first-class job. Pipe is rarely perfectly straight, and, even if it were, there is the chance of the thread on the pipe, or in the flange, being cut on a slight angle, which in a long run might throw the line out considerably, or in a run with a number of joints the multiplication of a very small error in each one will aggregate a large one. Each pipe should drop into place naturally without undue strain upon the flanges, and this can only be accomplished by the refacing method.

The shrunk joint is made in the following manner: The pipe is rounded up and calipered. The flange is then bored out to a shrinking fit, and, after being brought to a red heat, is slipped over the pipe and the end of the pipe peined over. The flanges are then turned up in a lathe, as before described. It is claimed for this joint that the full thickness of the pipe is carried through to the face, and consequently it will stand more pressure and have a longer life than the screwed joint. The experiments we have made do not bear out this view. It is certain that against tensile strain the screwed joint will hold all the pressure that can be put on it; in fact, with end and blind flanges sufficiently strong a pipe may be burst under pressure without injuring the threads, while against lateral strain, expansion or vibration a screwed joint properly made is, if anything, better. The chief objection to a shrunk joint is its high cost and the fact that a gasket must cover the end of pipe in order to make a tight joint. There are very few joints of this kind, whether they are shrunk on hot or peined on cold, which will not leak if the end of the pipe is exposed.

Cast iron flanges riveted on are very undesirable, as they almost invariably leak through the rivet holes when subjected to the vibration of a steam line in active service.

PACING FLANGES.

We are called upon to face flanges in various ways, the principal being straight face smooth, straight face

* Paper read by John B. Berryman, manager engineering department Crane Company, Chicago, before the Engine Builders' Association of the United States, at Pittsburgh, May 22, 1902.

corrugated, male and female, tongue and groove and 1-32 inch raised face inside bolt holes. For pressure of 180 pounds or less, our experiments go to show that a straight concentrically corrugated face will hold a Rainbow or copper gasket without trouble. We have made repeated tests with pressures up to 1000 pounds without blowing out the gasket. There is no manufacturing objection to male and female facing other than increased first cost, and the fact that such goods are not carried in stock and there is always a delay in filling orders, but operating engineers have frequently complained to us about the difficulty they experience in changing gaskets if for any reason it is necessary to break in on the line. It is a severe task to spring a large heavy pressure line apart sufficiently wide to permit of removing the old gasket and putting in a new one.

The tongue and groove joint is similar to the male and female, except that the recess is not carried out to the inner wall of the pipe. The end of the pipe is exposed to the pressure at all times and the joint is undesirable on that account.

(To be continued.)

PROBLEMS THE PLUMBER MUST SOLVE.

BY D. F. N.

Those who examine the accompanying sketch of a part of the plumbing in an up to date dwelling will find little to criticize, yet in it was the cause of considerable annoyance to the owner and his family. The work was

Problems the Plumber Must Solve.

in a house situated in the aristocratic section of upper Fifth avenue, New York, where in the evening the neighborhood is very quiet, making any unusual noise intolerable. It seems that in this fine residence, when the family least expected it, often as they were about to retire, and even after retiring for the night, a noise would begin. Sometimes it would commence in one part of the building, and sometimes in another, or at the third and fourth story bathroom, alternately. The noise developed last year about the holiday season and as a good head of steam was carried on the heating plant a steam fitter was called in to locate the cause of the trouble. After a thorough examination to locate any sluggishness in his returns, air valves, &c., he found them in good condition and so informed the owner.

The plumber was next called upon to make an examination, and after trying all the valve bonnets and cock seats, removing the composition washers and replacing them with the best rubber washers and making sure there were no loose parts in any of the plumbing fixtures in the building, he reported to his employers the condition in which he had left the plumbing work, and expected that no further trouble would be reported after his visit. To his dismay, however, a telephone call brought him before his employer to be informed that the nuisance still existed. He was told that arrangements had been made with the owner for him to stay at the place until the noise occurred and then to choke it off. In the evening the plumber arrived and continued his search for the trouble. All of the piping seemed to act properly, until suddenly in the early morning the noise appeared as if a trombone was being blown. It continued for ten minutes and then ceased for a time to start again. Sometimes the noise appeared to come from the kitchen sink, then again in the owner's bathroom. Finally, the trouble was located on a branch that was taken off from the double system of water

service pipes in the building, between the tank and the street pressure to supply the flush tank to the servant's closet, which was located on the fourth floor. With this clue as to the location of the trouble, the turning off of the controlling valve A on the street pressure pipe caused the noise to cease. This led to an examination of the interior of the ball cock in the flushing tank, when it was found that the washer in it was completely worn out on one side. This was replaced with a new washer and there was no further trouble.

This experience indicates that such nuisances must be caught when in action to be arrested. The more experience the journeyman plumber has before he is sent to look after such nuisances the more capable he will be to apply the remedy. Information on such subjects can best be secured in talks with different experienced journeymen. However simple the trouble may seem it is well to store away the information for future use in cases where experience alone is the best guide in detecting the cause and applying a remedy for troubles.

New York City Notes.

M. J. Moran of 913 Sixth avenue was the lucky bidder for the plumbing in the Hotel Bristol, at Fifth avenue and Forty-second street, which is now being altered into an office building.

Reynolds & McMahon have been fortunate in getting the plumbing of several of the large apartment hotels now being put up in the Forties between Fifth and Seventh avenues. They are now busy with a large job on Forty-ninth street, between Sixth and Seventh avenues.

Many of the individual building operators have combined into companies and will erect buildings, plans for a number of which have been filed. One of the causes of this is that larger and more expensive buildings are the only ones that are profitable to erect under the new Tenement House law. Another is that building loans can be obtained at a cheaper rate, or else done away with altogether, the company building on its own capital and credit. These companies will make the subcontractors more sure of their money and stiffen prices of property by reducing the number of foreclosures and forced sales.

Among the jobs lately given out and now under way is a large apartment house on 149th street, west of Eighth avenue, in which F. K. De Lacey is doing the plumbing; E. J. Hurley has the plumbing in two private houses on Fifth avenue, between Eighty-eighth and Eighty-ninth streets; J. J. Ahrens is plumbing three private houses on Audobon avenue, near 168th street; W. G. Cornell Company have the extension to the Germania Savings Bank at Fourth avenue and Fourteenth street; John Frick is plumbing the store and tenement building at Third avenue and Thirty-third street, and J. J. Fleming has an apartment on 116th street and Lenox avenue.

T. J. Tuomey is another of the plumbers with a Fifth avenue mansion job. He is doing the plumbing in one just below Seventy-ninth street. J. B. Barry is busy finishing up an apartment at the corner of Sixth avenue and Fifty-eighth street and is well along with one on Fifty-seventh street, west of Sixth avenue.

John A. Chambers of the old plumbing firm of Chambers and Lemon, 626 Columbus avenue, died last week after a long and painful illness. The funeral services were attended by many of the trade.

Coyle & Baaden of 83 Maiden lane are doing the overhauling in the American Express Company's stables at Lexington avenue and Forty-eighth street; W. H. Spelman & Co. are doing the addition to the Simpson-Crawford Company's building running from 121 to 131 West Nineteenth street; W. G. Cornell has a build-

ing on West Thirty-fourth street, between the Saks Building and the Savoy Theatre; Oliver Barratt has a store and loft building at 211-213 Park row; Huston & Corbett are plumbing a building on Thirty-fifth street running through to Thirty-sixth street, near Tenth avenue, which is to be a storehouse, factory and stable for the New York Bottling Company, and A. J. Smith of 1439 Madison avenue is doing two apartments on 113th street, between Seventh and Eighth avenues.

* * *

The State Executive Committee held a meeting in Rochester last week. Treasurer A. H. Brown and Vice-President B. F. Donohoe, who attended from this city, report that business is booming through the State and that the association matters were never in a more flourishing condition.

* * *

The Tracy Plumbing Company are busy with the new elevated power house and station at 110th street and Eighth avenue, besides which they are overhauling many of the company's stations.

* * *

Samuel Kessler of 504 Park avenue was the fortunate plumber in bidding for the new Grand Theater job at Grand and Forsyth streets. This is one of the largest jobs to be done on the East Side.

* * *

The Greater New York Association will hold its regular August meeting in connection with Queen's Branch at the New York Hotel Seaside Landing, Rockaway Beach, L. I., next Tuesday afternoon. The bowlers and bathers will doubtless be in attendance and after the meeting adjourns will be able to show their skill.

Heating and Plumbing Notes.

A CHARTER has been taken out by the Master Plumbers' Association of Norfolk, Portsmouth and Berkeley, Va. The officers are C. L. Forster, president; W. H. Barnard, vice-president; R. F. Lanier, secretary; A. W. Fairer, treasurer, and H. A. Vellines, sergeant-at-arms. E. L. Guy and P. J. Riley of Portsmouth and A. W. Kent are the directors.

W. F. RUTTER & Co., Lawrence, Mass., have completed the steam fitting in the factory of the American Woolen Company at Maynard, Mass., after spending ten months on the work.

THOMPSON BROS., Philadelphia, bid \$25,900 and secured the contract for heating and ventilating the Newton Girls' Grammar School in that city.

C. SCHMIDT, McKean, Ill., has the contract for plumbing the new residence of S. S. Chapeli.

THE plumbing shop of William Loane, San Francisco, Cal., was recently damaged to the extent of \$200 by a fire.

CONTRACTING QUARTERMASTER R. F. TURNER, Des Moines, Iowa, will receive bids until August 25 for plumbing, electric wiring, steam heating and gas piping for several buildings, including officers quarters and barracks, at Fort Des Moines, Iowa.

THE CLEVELAND STEAM FITTING & SUPPLY COMPANY of Cleveland, Ohio, have the contract for a central heating plant for the People's Saving & Loan Association Building, the Sargent Building, Rhodes Hall and a new building that is being erected in Cleveland.

THE OLIVER SCHLEMMER COMPANY, Cincinnati, Ohio, are sending out an announcement to the effect that the engineering and contracting business formerly conducted by Oliver Schlemmer has been incorporated under the title of the Oliver Schlemmer Company with the following officers: President, Oliver Schlemmer; vice-president and general manager, Clifford T. Schlemmer; secretary and treasurer, Oliver H. Schlemmer. The announcement states that the company are well equipped for handling steam and hot water contracts of any magnitude and that they make a specialty of power pipe fitting. The concern are unusually well equipped for installing plumbing and drainage systems.

In addition to a large assortment of stock carried they are prepared to cut Pipe to order on short notice. The company send with their announcement a list of many prominent buildings in Cincinnati and vicinity in which they have installed the plumbing and heating systems.

CITY ENGINEER FLOYD of St. Joseph, Mo., has issued a notice that plumbers who open the street for making surface connections must be more careful in replacing the paving or permits for additional work will be refused to them.

THE POND & HASEY COMPANY, Minneapolis, Minn., bid \$2625 and secured the contract for heating the school at La Porte, Iowa.

THE HITCHCOCK SUPPLY COMPANY, Springfield, Mass., wholesale dealers and jobbers in Plumbers', Steam Fitters' and Tinsmiths' Supplies, have increased their paid in capital from \$50,000 to \$80,000 to meet the needs of their growing business.

THE Council of State has authorized the borrowing of the money needed to equip the A. & M. College at Raleigh, N. C., with a steam plant for heating the college and operating the Textile Building.

CITY ENGINEER J. C. McCABE, Topeka, Kan., favors the idea of making his department more self sustaining by charging plumbers a fee to open the street for making water and sewer connections.

C. H. BARKER, custodian of the Post Office at Portland, Me., will receive bids until August 18 for plumbing the building.

THE THOMPSON METER COMPANY, 79 Washington street, Brooklyn, N. Y., have arranged so that master plumbers in New York City can get their orders for Meters filled at the New York Pipe Yard, 105 Fulton street, New York City.

THE McCORMACK HEATING COMPANY, Wallingford, Conn., have the plumbing for the new factory building now being erected by the R. Wallace & Sons Mfg. Company in that city. They also have the contract for heating the building being erected at Great Barrington, Mass., for the Berkshire Block Company.

THE plumbing trade are receiving from John H. Lawless, 138 Third street, Jersey City, N. J., a circular giving full description and directions for using the Lawless Plumbers' Force Pump, designed for removing obstructions from pipe and plumbing systems either by suction or by force. This Pump is made strong in every part and is capable of creating a high pressure.

A FOLDER, having a portrait of Uncle Sam in colors, discloses its identity when Uncle Sam takes off his hat and it is found that he does it for the purpose of bringing to the attention of the recipients the merits of the Gurney Bolders and Radiators made by the Gurney Heater Mfg. Company of Boston, Mass.

A. J. POTTS & Co. of St. Peter's, Minn., bid \$2800 and secured the contract for heating the Chaska Court House.

THE ELECTRIC HEATING COMPANY, Detroit, Mich., are sending out under date of July, 1902, a catalogue supplement No. 30, showing new designs and additions made to their line of manufactures. The supplement illustrates and describes Electric Cooking Ovens, Range Cooking Outfits and Glue Pots.

THE New York State Board of Armory Commissioners will receive bids until August 12 at 280 Broadway, New York, for heating the Armory of the Sixty-fifth Regiment in Buffalo, N. Y.

CHARLES B. SCOTT of Scranton, Pa., has secured the contract for the steam heating plant in the Simpson M. E. Church in that city.

HART & CROUSE COMPANY, Utica, N. Y., have sent to W. M. Mackay, manager of their New York office, at 235 Water street, a section of their new Royal Boiler having a 40-inch grate. This section is 5 feet wide and 6 feet high, and is one of the largest sections on exhibition in New York City. The section shows a large fire surface through the use of an auxiliary crown sheet. The upper portion of the boiler section is made to extend beyond the water leg and provides for a long fire travel to utilize the heat of the products of combustion. The

Boilers made from these sections are well calculated to carry a large amount of radiation. The fire chamber is equipped with a grate and is so arranged that it can be operated with little labor and keep the fire in a live condition.

THE employees of the Ashland Sheet Steel Company, Ashland, Ky., numbering nearly 200, who are members of the Amalgamated Association, struck work last week owing to President L. A. Kelly refusing to sign the Amalgamated wage scale. A majority of the men employed in the Ashland plant were formerly employed at the Sheet mills in Cambridge, Ohio.

THE Warren department of the National Tube Company, at Warren, Ohio, which has been idle for some time, is to be dismantled. The better part of the equipment of the plant will be removed to other works owned by the National Tube Company.

THE E. KEELER COMPANY, Williamsport, Pa., were awarded a contract aggregating a half million dollars for 48-inch Riveted Steel Pressure Pipe for the White Mountain Paper Company. This Pipe will run from Portsmouth, N. H., to Berwick, Maine, a distance of about 12 miles, and a half mile of it will be 50 feet under the river.

J. M. KLINE, Beavertown, Pa., is the patentee and manufacturer of the Kline Hydraulic Ram, which, he claims, is able to deliver water to a greater altitude under similar conditions than any other.

CHARLES B. HOOPER, who for 34 years had been connected with the Colwell Lead Company at 63 Centre

Nair, Wm. H. MacDonald, J. F. Tattersall, Robert Hardgraves and David McGinnis.

New Firms and Changes.

THE TROTT FUEL BURNER COMPANY of Birmingham, Ala., have been organized with a capital of \$10,000 by John H. Peebles, T. T. Ashford and G. Ghisholm, for manufacturing a Burner for fuel oil.

THE plumbing and tinsmithing firm of Gibbons & Donahue, Great Barrington, Mass., will in future be conducted by Mr. Donahue. Mr. Gibbons retires from the firm.

THE BALL CHECK LIGHT COMPANY of 525 Main street, East Orange, N. J., have been incorporated with a capital of \$1,000,000 by Edward T. Magoffin, Frank R. Serles and Walter H. Bond. The company will manufacture, buy, sell and deal in all devices and appliances for light, heating and power, either electrical or gas.

ELLIS W. MORSE & Co. are about opening up in the mill and steam supply business at 112 Court street, Binghamton, N. Y. They will do both a retail and jobbing business, and expect to cover considerable territory outside of Binghamton. The new firm will be pleased to receive catalogues and price-lists pertaining to their line.

Dudly's Combination Wrench.

The A. Dudley Mfg. Company, Menominee, Mich., are placing on the market the combination wrench shown herewith. It is made of steel and the working

Dudly's Combination Wrench.

street, New York, died suddenly on July 31. The deceased, who was a cousin of the late B. Frank Hooper, president of the Colwell Lead Company, was confidential bookkeeper and assistant treasurer of the concern, as well as a stockholder, and acted as trustee of the Hooper estate. He was born in New York City 64 years ago and had lived there all his life. He was greatly affected by the death of his cousin, to whom he was closely attached, and this is thought to have hastened his own end.

GEORGE W. DUNN, secretary of the Soldiers' and Sailors' Home at Bath, N. Y., will receive bids until August 14 for reconstruction and repairs to the electric plant, steam plant, heating stacks, fresh air ducts and heating and ventilating systems at the hospital, also for alterations and betterment to the plumbing in the hospital.

UNDER date of August 6, E. D. Hornbrook, president of the Association of National Plumbers, has issued from the headquarters in Kansas City a supplement to the "Directory of Recognized Master Plumbers." The supplement contains five pages of new names and one page of names to be erased from the official directory.

THE JOHN SIMMONS COMPANY, 110 Centre street, New York City, are attracting some attention in the trade with their handsome new auto delivery truck of 4 tons capacity. The chauffeur is one of their regular truckmen, who has found no more difficulty in managing this "auto" than a pair of horses.

THE master plumbers and the journeymen plumbers of Paterson, N. J., have united in an excursion to Rackaway Beach, L. I., to enjoy a clambake and shore dinner, at which they are regaling themselves to-day. The Committee of Arrangements are J. C. McNab, J. P. Mc-

parts carefully tempered. The upper jaw of the pipe wrench is interchangeable and can be replaced when necessary. The wrench is referred to as having a sure grip and quick release, as holding pipe, rods, studs and square or hexagon nuts, and as being adapted to the use of steam fitters, plumbers, machinists, miners, engineers and engine builders. The wrenches are made in four sizes: No. 1, 12-inch, with interchangeable jaw; No. 2, 12-inch, without interchangeable jaw; one 7 and one 9 inch automobile wrenches.

According to an account in the *Scientific American*, the air resistance to the rotation of a fly wheel may cause a considerable loss of energy. A 450 horse-power engine, direct connected to a generator, has a fly wheel with channel shaped arms. The tests were made by using the generator as a motor, driving the fly wheel up to normal speed. It required 13,300 watts to rotate the wheel and shaft, but by inclosing the arms in a sheet iron casing the wheel was driven by an expenditure of 9874 watts. The saving effected by use of the shield was 5.7 horse-power, or 1.2 per cent. of the power of the engine.

The Buffalo Natural Gas Company, Buffalo, N. Y., announce that a sufficient supply of natural gas from the Pennsylvania fields has been secured, so that the extra demands made upon the company by manufacturing concerns in Buffalo can now be met. It is stated that some hundreds of concerns and individuals who have for some time past been applying in vain for connection with the company's natural gas supply will now receive that connection.

A trolley line is to be built at Franklin, N. H., without a track upon which to run the cars.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERNS FOR A CONCAVE FURNACE TOP.

From Furnace, Rochester, N. Y.—Will *The Metal Worker* please tell me how to cut the patterns for a furnace top of the following dimensions: Diameter at bottom, 10 feet 10 inches; diameter at top, 9 feet 8 inches; depth, 13 inches, the concave top to be 4 inches deep?

Answer.—The concave top constitutes an inverted cone whose base is 9 feet 8 inches in diameter and whose altitude is 4 inches. The radius with which to describe the pattern will be the slant height of the cone found by constructing a diagram of the same, either full size or with accuracy to a scale not less than one-fourth full size. In the accompanying illustration A C represents the vertical center line of the furnace top.

Patterns for a Concave Furnace Top.

Draw A B and C D horizontally 13 inches apart, representing respectively the upper and lower lines of the article. Measuring from the center line, make A B 4 feet 10 inches long, one-half the required upper diameter and make C D 5 feet 5 inches long, one-half the required lower diameter, and draw B D. Also set off on the center line the point E 4 inches below A and draw A E, thus completing a sectional view of the furnace top. Then will E B be the radius for the pattern of the concave top, as above described, the pattern being shown in the upper part of the diagram.

To obtain the circumference of the pattern it will be necessary to first construct a quarter plan of the top. Therefore, from any point as S on the center line extended, with radii equal to A B and C D, describe the quarter circles H J and F G, terminating them at the top against the center line and at the bottom, at the line S G, draw horizontally from the point S. The circumference of the quarter circle H J, as measured by the equal spaces designated by the points 1 to 8, may then be set off on the line B' H' of the pattern, as shown, and if one-half the pattern should be required in one piece the arc B' H' may be extended to K, making H' K equal to B' H', as shown by the eight additional spaces.

To find the radius with which to describe the pattern for the sides of the furnace top, extend the line B D of the sectional view upward until it intersects with the center line A C extended at L. Then will L B and L D be respectively the radii for the upper and lower edges of the side pieces. From L as center, with these radii, describe the arcs B M and D N, as shown, and make the arc D N equal in length to the arc G F of the plan, as shown by the corresponding equal spaces in both. Then will B M N D be the pattern for one-quarter of the side piece. The necessary edges for joints should be allowed.

BOILER TOO LOW.

From F. R. P., Southampton, N. Y.—I notice in *The Metal Worker* of August 2 a communication from "B. K. M." regarding a noise in the water back. I would like to say through your columns that if the arrangements are as shown the height of the boiler can have no possible effect on the noise, as I have placed boilers on the floor below the range and got perfect results. If there is no dip or traps in the hot water circulating traps, and the water back has no stoppage which could be determined by the temperature of the water drawn, there are only two things that could cause the trouble. The boiler feed may be connected to the hot water outlet instead of the cold water inlet. If this is not the cause, the only thing left is "too much water back." The steam generated accumulates in the boiler and not in the water back. This takes place probably to such an extent that the water is forced out of the boiler through the cold water inlet leaving the boiler full of steam instead of water. Consequently there is no circulation at all; hence the noise. If this takes place, hot water could be drawn from some cold water faucet near the boiler. As "B. K. M." does not give the size of the water back he will have to determine this for himself. The latter is probably the cause of the trouble, and by insulating part of the water back it could be avoided.

Note.—Notwithstanding the positive views of our correspondent that the location of the boiler is not the cause of the trouble, we are of the opinion that boilers so located more frequently cause noise, while the circulation is certainly more sluggish than in those located differently.

RETIMNING A SOUP KETTLE.

From J. D. W., Spokane, Wash.—Please explain the best way to tin a soup kettle made of copper and of about 30 gallons capacity. The kettle was set up on March 15 last and I had to retin it on June 1. The tinning which was on the kettle when it came from the factory only lasted two and a half months. After I tinned it the coating lasted about seven weeks with about the same use. I would like to know if there is some method of tinning which would make it more permanent. I should also like to have those who do such work inform me how they base their system of charging for it.

Note.—We shall be glad if our friends in the trade will render such assistance as they can to this correspondent, both as to the practical work and the charges. In the mean time we would state that in *The Metal Worker* of March 15, 1902, the method of retinning copper cooking utensils was carefully explained. The process for doing such work is the same in principle, although larger fires will probably be required for the work above mentioned. This subject is also treated at some length in "The Art of Coppersmithing," which can be furnished by our Book Department.

The system of charging for work of this kind is based on the cost and is made in accordance with the conditions of the job, the skill required and the size of the work. The actual cost is multiplied by two or three, according to the size of the work and the difficulty in handling it. On some kinds of light work a charge of 4 or more cents an inch is asked, the diameter and depth being added together to determine the number of inches to be charged for. The system of charging varies, however.

PIPING FOR HIGH PRESSURE STEAM.

From L. G. H., Lancaster, Wis.—I have a customer here who is handling a steam laundry with a traction engine and boiler in a basement, and he wants to put in some pipe coils to heat the floor above with steam. What I should like to learn from *The Metal Worker* and its readers is which would be the best and cheapest manner of disposing of the condensation from the coil and the best method of running the supply in return pipes. The pressure runs up to 120 pounds.

Note.—We shall be glad if our readers will give their views on this problem. In the mean time we would suggest that if live steam is to be used in the heating coil, there is no reason why the condensation should not be brought back from the coils and connected with the boiler below the water line. The heating, however, could be done just as readily with steam of a much lower pressure, or the exhaust steam running the apparatus. If there is not a sufficient quantity of the exhaust steam or a low pressure is to be carried on the heating coils, a reducing valve would be necessary to reduce the pressure to about 5 pounds. Beyond this valve the steam pipe should be carried with a downward pitch to the place where the risers are carried up to the coils and the main should be of ample size to supply the heating surface with which it is to be connected. A small relief pipe can be connected with the main at the risers to allow the condensation to be carried to the return pipe. In case a low pressure is carried on the heating coils the return pipe cannot be connected with the boiler direct, but should be connected with a steam trap to prevent the waste of steam. This will discharge the condensed water either into the receiving tank, where it can be pumped into the boiler, or into the drain. There is no great difficulty in doing this work, but it requires some knowledge, and it is probable that the employment of an experienced steam fitter would be advisable in order to learn in detail the conditions that must be considered and also to determine the size of the radiators and the supply of the return pipes to them.

RUSTING OF GALVANIZED IRON ROOF.

From C. & H., Northville, Mich.—We have taken *The Metal Worker* for the past 15 years and have received a great deal of good information from it. We are now up against the real thing and ask you to help us out, if possible. Two years ago we put on 12 squares of No. 28 galvanized iron roofing over a store, but laid it over a tin roof that was in fair shape, except for holes, and laid paper between the tin and the iron. The galvanized iron roof has rusted from the under side and is as thin as tissue paper, as shown by the sample of the rusted roofing which we send herewith. We have put on galvanized iron roofing before in this town for several years, but have never had this kind of trouble. Is the trouble caused by putting the paper between the tin and iron, or is it caused by not removing the old tin and it holding moisture?

Answer.—The sample of rusted iron sent by our correspondents shows the galvanizing on the outside in fair condition while the inside is thoroughly rusted. Our correspondents do not state, however, what kind of paper was used between the tin and iron roofs, nor for what purpose the store was used. Some roofing papers contain chemicals or acids, which would have a tendency to rust the metal. If, however, the paper was not to blame, the rusting was undoubtedly caused by the condensation between the tin and iron roofing. It is possible that the paper absorbed the condensation and was constantly moist, when the outside air was cool, or, in other words, when there was a difference in temperature between the outer air and the air space between the two roofing materials. The damp paper lying constantly against the iron roofing would cause the rusting, as shown. We would suggest that the old tin roof be ripped off, and if there is no false ceiling to the store, that two ventilators be put in the roof, with dampers operated from the store. This will allow the escape

of the warm air at the ceiling, which would otherwise cause condensation against the bottom of the roofing. It would be best when laying the roofing to omit the paper.

BURSTING SEAMS IN GUTTER.

From S. P. O., Walton, N. Y.—Can you inform me if a copper gutter will stand more strain from ice forming in it than a tin one? I have a double pitched roof with a gutter at the eave of each side. The conductor freezes full of ice, and the water and snow stand in the gutter and freeze, breaking the seams. The roof is large and the gutter is shallow and flaring; but it causes me much trouble. Can you suggest a remedy?

Answer.—The bursting of the seams is caused by the expansion and contraction of the metal, which would also occur in a copper gutter if the seams were not well soldered. If there is any way by which the conductor could be kept clear, as by introducing a small steam pipe at the bottom of the conductor, thereby keeping the conductor open, this would prevent the trouble. However, if this cannot be done we would suggest that the seams be thoroughly soaked with solder; then over the seams solder another strip of metal about 2½ inches wide, soldering each side, which will overcome the trouble. Care should be taken when soldering this strip not to merely skim it over with solder, but, on the flaring parts of the gutter, thoroughly soak with solder and place small ridges of solder at intervals to strengthen the seam.

The Ventilation of Subways.

A serious question has arisen in connection with the underground tube railway, with which London within a few years is to be pierced in all directions. It has been argued, says the *New York Sun*, from the start of the "tuppenny tube," that the ventilation was automatic and well nigh perfect by reason of each train nearly filling the tube and acting like a piston, forcing out the bad air and drawing in the fresh air. The public accepted this theory; as there were no bad odors, it was assumed that the atmosphere was healthful.

The patronage has become so great recently that the cars at certain hours have been as badly crowded as on the New York elevated railways, and many passengers began to complain of feelings of dizziness and oppression. It was found that this was due to the presence of a great excess of odorless carbonic acid gas generated by human lungs. A healthy atmosphere should not contain a larger proportion than seven parts in 10,000 of this gas. Ordinary London air contains four parts, a London fog seven parts, and the average living room seven. The standard of purity required in English workshops by the Factory act is not to exceed nine.

Three tests were recently made of the air in the tube. The first sample, taken from the top of a crowded car, showed 27½ parts of carbonic acid gas. This is distinctly poisonous. A second sample, taken from a moderately filled car, showed 13 parts. A test made of the air in Chancery lane station as a train was leaving, when the purest air should be obtained, showed 13.8-10 parts.

It is believed that this serious situation can be much improved by closing all the openings between the two tubes. There is always a lively breeze blowing in the present tubes, but the foregoing tests show that the air simply moves in what may be described as a vicious circle.

There seems to be need of a term to designate the new terrors of our streets, those speed crazed cranks who are now doing so much to bring the automobile into disrepute. Various terms are loosely applied, but a new compound would be desirable. The *Horseless Age* suggests the word "automaniac," which is in harmony with several well-known words of Greek derivation already rooted in the language as descriptive of victims of diseased and abnormal appetite (dipsomaniac, kleptomaniac), and conveys a strong and true picture of the mental state of these offenders against law and decency.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and $\frac{1}{4}$ c. higher in price.
Copper is in light demand and without change in price.
Pig Lead is dull and firm.
Spelter continues scarce and strong, with light demand.
Cookson's Antimony is $\frac{1}{4}$ c. lower.
Nickel is in fair demand and slightly lower in large lots.
Aluminum is firm and in good demand.
Tin Plates are very quiet and unchanged in price.
Black Sheets are quiet, with prices unchanged, but weaker.
Galvanized Sheets are quiet and unchanged.
Scrap Iron is strong and higher.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in fair demand and firm in price.
Sheet Zinc is firm; demand is moderately active.
Hardware is seasonably quiet, with prices strong in nearly all lines.
Cast Iron Soil Pipe and Fittings are in active demand, with some scarcity and prices strong.
Wire Nails are quiet, with prices unchanged.
Cut Nails are in moderate demand at unchanged prices.
White Lead is moving in fair volume with prices firm.
Window Glass is quiet and unchanged.
Linseed Oil is moderately active and firm.
Spirits Turpentine is quiet and unchanged.

METAL MARKET.

Pig Tin.—In the early part of the week the market for Tin was quiet and unchanged. The nonarrival of steamers which were expected gave the speculative element an opportunity for bidding prices up, and they did it. Up to Thursday only 60 tons had arrived, while 965 tons were due. That morning a steamer bearing 365 tons arrived and prices fell to about the level of a week ago. The activity on the Metal Exchange was purely the work of the speculative element and had no bearing on general trade, which is still quiet. At the close the market was firm. Straits Pig in small lots was quoted at $29\frac{1}{4}$ c. to 30c. per lb.

Copper.—The market is very quiet and still in buyers' favor. Prices are practically unchanged from last week, but the tone of the market is easier. Jobbers quote Lake Ingot in small lots at 13c. per lb., and Casting Copper at $12\frac{1}{2}$ c. to $12\frac{3}{4}$ c.

Sheet Copper.—The demand for Sheet Copper continues of fairly good proportions and prices remain firm on the basis of 18c. per lb. from store.

Pig Lead.—The market here is entirely without change. Demand is slow, as is customary at this season of the year, and prices are firm. American Pig in small lots is quoted at 4.45c. to $4\frac{1}{2}$ c. per lb. St. Louis advices report conditions as very little changed in the Lead market, and the week under review shows a moderate volume of business at old figures.

Spelter.—The market for Spelter remains firm. Spot metal is still very scarce and strong in price. The demand from all sources is comparatively small. Good Western brands in small lots are quoted by jobbers at 6c. to $6\frac{1}{2}$ c. per lb. St. Louis advices report transactions in the Spelter market on a fairly liberal scale and prices continue to harden.

Antimony.—Cookson's has declined $\frac{1}{4}$ c. and is quoted in small lots at $10\frac{1}{4}$ c. to $10\frac{1}{2}$ c. Hallett's is unchanged at $8\frac{3}{4}$ c. to $8\frac{7}{8}$ c. per lb. in small lots.

Nickel.—This metal has declined somewhat, so far as wholesale prices are concerned, but small lots are quoted at from about 55c. to as high as 60c. per lb.

Aluminum.—The demand for Aluminum continues active and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is unchanged. The demand is slow and jobbers' prices continue at about the figures quoted for some time past. The American Tin Plate Company are now quoting for delivery up to December 1 at the figures now ruling. Stocks are increasing in volume, and it is likely that a large proportion of the mills will be shut down, owing to the failure of the men to accept the proposition of the American Tin Plate Company of a reduction in the wage scale on Plates for export. The retail trade was rather more active this week. Jobbers are quoting American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots, delivered at New York and corresponding points at about \$4.70 to \$4.90 per box.

Sheets.—There is little or no improvement to note in the Sheet market, which continues quiet and is disappointing to those who had hoped that tonnage would pick up before this. The new capacity in Sheets which has come on the market in the past year is now being severely felt, as there is not enough business being placed to go around and keep all the mills busy. Quite a number of Sheet mills are idle at the present time and output has been reduced a good deal. Stocks are increasing and prices show a weakening tendency. Jobbers' quotations, however, are not quotably changed. No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots are quoted at about 3.70c. and No. 24 Galvanized at 4c to 4.10c.

Chicago advices are as follows: No new features have been developed, with the exception of Galvanized prices, which are sustained. Sheets are heavy and weak. No. 27 Black Sheets in small lots from store are quoted at 3.45c. to 3.55c., and Galvanized Sheets at 4.55c. to 4.65c. for No. 27.

Old Metals.—The demand for Scrap Iron is now active and prices have stiffened somewhat. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

Heavy Copper.....	per lb. 10 c.
Light and Tinned Copper.....	per lb. 9 c.
Heavy Brass.....	per lb. 8 c.
Light Brass.....	per lb. $6\frac{1}{2}$ c.
Lead.....	per lb. $3\frac{3}{4}$ c.
Tea Lead.....	per lb. 3 c.
Zinc.....	per lb. $3\frac{1}{4}$ c.
Pure Aluminum Sheet.....	per lb. 22 c.
Cast Aluminum.....	per lb. 17 c.
No. 1 Pewter.....	per lb. 18 c.
No. 2 Pewter.....	per lb. 9 c.
Tin Plate Scrap, per gross ton.....	to \$5.00
Wrought Iron Scrap, per gross ton.....	\$14.50 to 15.00
Heavy Cast Scrap, per gross ton.....	12.50 to 13.00
Stove Plate Scrap, per gross ton.....	9.50 to 10.00
Burnt Iron, per gross ton.....	7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—Continued buying for delivery during the early part of 1903 is reported, but in some instances negotiations are dragging because buyers are inclined to hold out for lower prices. A good deal of Foreign Pig Iron is being offered, and there is quite some competition among dealers for importation. Scotch Pig is being offered at \$20 to \$23, the higher price being demanded for special brands. Middlesborough No. 3 is quotable at \$18.75 to \$19. For spot lots of Scotch Iron considerably higher prices are asked and obtained. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. IX, \$22.75 to \$24.75; No. 2 X, \$21.75 to \$22.75; No. 2 Plain, \$20.75 to \$21.75. Tennessee and Alabama brands, in New York and vicinity, No. 1 Foundry, \$22 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$20.75 to \$21.25.

CHICAGO.—The general character of the market has changed but little since last report. There are still a

few large buyers in the market ready to place contracts for next year's delivery, but most of the transactions during the week were from the smaller melters; nine-tenths of the business transacted has been for next year's delivery—that is, running up to July 1. Probably about half the tonnage sold during the week was of Northern brands. The urgency for spot Iron and Iron for delivery during the last quarter of the year has met with little relief, and the stringency of the market is being admitted by consumers as well as by furnaces. Sales of spot Iron have been made in carload lots aggregating possibly 1000 tons of Southern brands, on the basis of \$25.65 for No. 2 and \$26.15 for No. 1 Foundry, Chicago. Twenty-five hundred tons of Northern No. 2 Foundry have sold at \$25 and 200 tons of special Southern brands at \$24.50 for October, November and December, 1902. The majority of the spot Iron being sold brings a premium of \$5 per ton, and Iron for the last quarter of the year a premium of about \$3 per ton over the prices current for delivery for the first half of 1903. The following are the prices current for July, 1903:

Lake Superior Charcoal.....	\$25.00 to \$26.00
Local Coke Foundry, No. 1.....	21.50 to 22.00
Local Coke Foundry, No. 2.....	21.00 to 21.50
Local Coke Foundry, No. 3.....	20.50 to 21.00
Local Scotch, No. 1.....	22.00 to 22.50
Ohio Strong Softeners, No. 1.....	24.00 to 24.50
Southern Silvery, according to Silico.....	22.10 to 22.65
Southern Coke, No. 1.....	21.40 to 21.90
Southern Coke, No. 2.....	20.65 to 21.15
Southern Coke, No. 3.....	20.15 to 20.65
Southern Coke, No. 1 Soft.....	21.15 to 21.65
Southern Coke, No. 2 Soft.....	20.65 to 21.15

PHILADELPHIA.—The situation is the same as last week. Good Foundry Irons are as scarce as ever, the demand is as large as ever, and prospects of easier conditions as uncertain as ever. Foreign Iron is about the only kind that can be had promptly. The feeling in regard to prices in the distant future is surprisingly strong considering the high range already attained. Consumers are again beginning to figure on purchases for next year's business. A considerable tonnage was entered some time ago, after which for two or three weeks there was a halt, but now buyers are again in the market. Makers are quite willing to meet the demand at present prices, on the ground that even if there should be a further advance they will not be far astray in having order books well filled at about \$22 for No. 2 X Foundry. A fair average of existing prices would be about as follows for city and nearby deliveries during 1903, and from \$1 to \$1.50 more for this year's deliveries, the premium being mostly on Foundry grades:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.00 to 22.50
No. 2 Plain.....	21.00 to 22.00
No. 3 Middlesboro { Prompt shipments }	21.00 to 22.00
Scotch Irons { or spot. }	22.50 to 23.50

PITTSBURGH.—The market is very quiet, but strong. Consumers are pretty well covered, furnaces have most of their output under contract for this year, and Pig Iron for prompt shipment is scarce. No. 2 Foundry for prompt delivery is \$22.50 to \$23, Pittsburgh. For delivery next year No. 2 Foundry is being sold at \$21.50, Pittsburgh.

CINCINNATI.—While the volume of Iron sold for next year's delivery is not as heavy as it was the week previous, yet the week just closed shows a very nice sales account to its credit. Iron is being sold at \$17.50, and possibly in some instances as high as \$18, where special circumstances prevail, but a number of furnaces are saying \$18 to \$19, Birmingham, or else no sale, these holding firmly to the belief that it will only be a question of time, at least, until they get their price. Spot Iron is very scarce, and the high grades bring practically what the seller chooses to ask for them. A sale of 500 tons of No. 4 Southern is reported sold for August delivery at \$18.25, Birmingham. We quote, f.o.b. Cincinnati, for 1902 delivery as follows:

Southern Coke, No. 1.....	\$23.00 to \$24.00
Southern Coke, No. 2.....	22.50 to 23.50
Southern Coke, No. 3.....	22.00 to 23.00
Southern Coke, No. 4.....	20.00 to 21.00
Southern Coke, No. 1 Soft.....	23.00 to 24.00
Southern Coke, No. 2 Soft.....	22.50 to 23.50
Ohio Silvery, No. 1.....	26.10 to 26.60
Ohio Silvery, No. 2.....	25.85 to 26.10
Lake Superior Coke, No. 1.....	26.10 to 26.60
Lake Superior Coke, No. 2.....	25.60 to 26.10
Lake Superior Coke, No. 3.....	25.10 to 25.60

ST. LOUIS.—The market has shown considerably more vigor and snap the past week owing to increased inquiry and demand for Iron for the first half of 1903. In the matter of price the transactions have been on a basis of \$17 to \$17.50, Birmingham, for No. 2 Foundry. Spot Iron is as scarce as ever, and occasional car lots are about all that the market sees of this class of material. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$21.50 to \$23.50
Southern, No. 2 Foundry.....	20.75 to 22.75
Southern, No. 3 Foundry.....	20.25 to 22.25
Southern, No. 4 Foundry.....	19.75 to 21.75
No. 1 Soft.....	21.25 to 23.25
No. 2 Soft.....	20.75 to 22.75

CHICAGO REPORT.

Scrap Iron and Steel.—The light offerings and the increased demand from consumers enable dealers to pay higher prices for Country Scrap, the market closing strong at the higher prices. Both Wrought and Machinery Cast Scrap, as well as Stove Plate, have been advanced 50c. per ton. Old Boilers, Tubes, Turnings, Borings and Horseshoes have also been appreciated about 50c. per ton. The following are the prices paid by dealers in carload lots, Chicago:

	Per net ton.
Country Wrought Scrap.....	\$15.00 to \$15.50
Machinery Cast.....	13.50 to 14.00
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	10.00 to 10.50
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plov Steel.....	12.00 to 13.00
Breaking Stock.....	... to 11.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	13.00 to 14.00
Old Gas Pipe and Boiler Tubes.....	13.00 to 13.50
Cast Borings.....	9.00 to 9.50
Turnings.....	12.50 to 13.00
Horseshoes.....	14.50 to 15.00

Old Metals.—But little if any change is noted in the character of the market. The demand for both Copper and Brass is only moderate, but prices are well sustained, the market being a little firmer in sympathy with Ingot Copper. Zinc continues firm with a good demand. The following are the prices paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 1/2 c.
Copper Bottoms.....	9 1/2 c.
Copper Clips.....	10 1/4 c.
Red Brass.....	10 1/2 c.
Yellow Brass.....	8 1/2 c.
Red Brass Borings.....	9 1/4 c.
Yellow Brass Borings.....	7 1/2 c.
Light Brass.....	6 3/4 c.
Pipe Lead.....	3.70 c.
Tea Lead.....	3.35 c.
Zinc.....	3.35 c.
Tin Foil.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—The offerings, while not especially heavy, are more than ample to meet the demand, yet prices are without essential change. Dealers buy at the following prices, Chicago delivery:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5 1/2 c.
Black Rubber.....	4 c.
White Rubber.....	8 1/2 c.

Rags.—The tone of the market is stronger under an improved demand and smaller receipts, and dealers are paying about 10c. per 100 lbs. more. Country Mixed Rags are purchased by local dealers at 75c. to 85c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The local situation is dependent upon conditions at primary points, and as near as can be determined there is little change in the attitude of the miners or operators. Stocks are none too large, but the demand is light for current delivery. The movement on contracts has continued moderate. The following are the prices current, subject to a discount of 10c. per ton for shipments made during the month of August:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

Midsummer conditions continue to govern nearly all branches of the Hardware trade. The vacation season is seldom a time for great activity. Nevertheless, a few noteworthy features are observed, the most important of which is that large buyers are again beginning to place orders for Shelf Hardware. They have for some time refrained from making purchases, waiting to see how manufacturers would stand the test of the summer. But finding no indication of weakness, and realizing that if they are to get goods for their fall trade they will have to order them soon, they are entering the market. While jobbers and retailers are believed to be carrying larger stocks of goods than for many years, yet these stocks are not equally distributed through the entire line, as in some branches of trade manufacturers are still in arrears in filling their orders, although working to their full capacity. It has been the experience of all Hardware merchants for several years that the supply of seasonable goods has fallen considerably short of the demand. Every successive season through this period of prosperity they have laid in larger stocks in the expectation of satisfactorily meeting their customers' requirements, only to encounter the same discrepancy between their supply and the demand, due to the steadily increasing consumption of the country. It remains to be seen whether this year the extent of the fall trade has been measured accurately or whether a shortage will again be experienced. The fine outlook for the crops inspires a widespread belief that trade will be greater than ever and that again it will be found that not enough goods were made up in advance.

NOTES ON PRICES.

Plumbing Supplies.—Are in fairly active demand for the season, with prospects of a large volume of trade ahead. Prices rule strong throughout the list. Cast Iron Fittings are higher and it is likely that other Iron Goods will be advanced in the near future, owing to the conditions ruling in the market for raw material.

Wire Nails.—There is a continued movement of Wire Nails, as the result of a demand which is fairly satisfactory for the season. The mills are making shipments promptly, but annoying delays occur on many of the railroads owing to the large demand made upon transportation facilities. The local movement of small lots of Nails from store is larger in proportion than the demand from nearby points. Small lots from store, New York, are quoted at \$2.25 to \$2.30 per keg.

Cut Nails.—There is a temporary scarcity of some sizes of Flooring Nails in the local market, owing to the large demand and to delayed shipments from mill. Otherwise the demand is normal. Small lots of Cut Nails from store, New York, are quoted at \$2.30 per keg.

Window Glass.—The first part of August finds the Window Glass situation in a still unsettled condition. Demand for Glass is reported as being very light, and buyers as having adopted a waiting policy, exchanging stocks and buying from hand to mouth, in view of the possibility of a start of the factories on September 1. The opinion is expressed that there is too much Glass in the country for so early a start. The Jobbers' Association quotation for single and double strength Glass from store is 88 and 5 per cent. discount.

White Lead.—White Lead in Oil is in fair demand, and manufacturers are working on orders for fall delivery. Retail quotations are unchanged at 6¼ to 6½ cents per pound for White Lead in Oil.

Linseed Oil.—Demand is confined to small lots, but business in this line appears to average up fairly well with corresponding seasons of former years. The large buyers are generally supplied up to September or October. Quotations are unchanged: City Raw, in small lots ruling at 67 to 68 cents per gallon.

Spirits Turpentine.—The Turpentine market has been dull, with inquiries confined to small lots. Large buyers are not in the market, and quotations, according to quantity, remain unchanged at 47 to 47½ cents per gallon for Turpentine in retail quantities.

TRADE NOTES.

GEORGE W. HOFFMAN, manufacturer of Hoffman's Infalible U. S. Metal Polish Paste, Indianapolis, Ind., reports that owing to the constantly increasing demand for this product he has made extensive additions to his plant by the completion of new buildings, doubling its former capacity. Mr. Hoffman claims that his Metal Paste is the only preparation of the kind that does not shrink or become rancid, gummy, sticky or hard.

THE COATESVILLE BRASS COMPANY, Coatesville, Pa., have been incorporated with a capital of \$5000. The directors are James, Samuel and Walter E. Greenwood and Orville H. Daggett and William H. Denn of Coatesville.

THE AMERICAN ASBESTOS COMPANY, recently organized at Terre Haute, Ind., with a capital stock of \$1,000,000, have secured options on 4000 acres of land in Bedford County, Ind., on which are situated partially developed Asbestos and Mica mines.

AUGUSTUS J. CORDIER, vice-president and general manager of the Lalancée & Grosjean Mfg. Company, has been elected a director of the Hanover National Bank of New York, one of the oldest and most prominent financial institutions of the city.

BRAMHALL, DEAN & Co., 264 Water street, New York, are sending to the trade a four-page circular devoted to their Champion Ice Cracker, devised to take the place of a mallet and to be run either by power or by hand. It is designed for use in hotels, restaurants or other places where crushed ice is needed.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., are sending out their August calendar desk blotters advertising Dixon's American Graphite Pencils.

THE ROME MFG. COMPANY, Rome, N. Y., manufacturers of Nickel Plated and Polished Copper Specialties, have established a European agency at 19 Chapel street, London, England, under the charge of William Cruger Cushman.

W. F. PFLUGER has retired from the Manitowoc Aluminum Novelty Company, Manitowoc, Wis.

J. M. TRUNK of Chunchola, Ala., is organizing a company to manufacture a tool that comprises an Anvil, Pipe Vise, Drill, Vise, and Cut-Off.

THE CAMBRIA SLATE COMPANY of Delta, Md., have been incorporated with a capital stock of \$100,000 to develop Slate quarries.

THE JOSEPH SHAFFER LAMP COMPANY have been incorporated at Wheeling, W. Va., with a capital stock of \$10,000, to manufacture Lamps. The incorporators are Joseph W. F. Shaffer, George P. Folmer, John Hunker and A. M. Schenck.

THE ZACHARY MANTEL COMPANY of Raleigh, N. C., have been incorporated with a capital stock of \$25,000, by A. D. Zachary, John E. Bridges and R. J. Hughes, for the manufacture of Mantels, Grates, &c.

THE TAYLOR & BOGGIS FOUNDRY COMPANY, Cleveland, Ohio, are manufacturers of all kinds of Light Gray Iron Castings and Builders' Hardware. In another column the company call attention to some of their specialties, including Dampers, Gas and Oil Stoves, Furnace Lamps, Molasses Gates, &c.

THE WALLACE MFG. COMPANY is the name of a new corporation formed at Detroit, Mich., with a capital of \$25,000, all paid in. The following are officers of the company: B. F. Pashby, president; Dore E. Wallace, vice-president; James C. Wallace, secretary, and Clarence C. Lowrey, treasurer. A Cooker, Patent Thimble and other articles of iron and steel are to be manufactured.

United States Consul Andrew D. Barlow of Mexico City reports to the State Department that the State of Oaxaca, Mexico, has offered a prize of \$5000 in Mexican currency to the person or company who, within three years, shall drill and put into working order an artesian well in the city of Oaxaca, or in the towns of Xochimileo, San Filipe del Agua or Hacienda del Agullera.

Exemption from all local and personal taxes will be granted to those who undertake the work, both during the time of erection and for a period of ten years after, if the results are successful. The property and use of the artesian well will belong exclusively to the person or persons to whom the concession is granted, who will also enjoy all the privileges allowed to those engaged in public works.

New Publication.

The Art of Enameling on Metal. By William Norman Brown. Publishers, D. Van Nostrand Company, New York, 1900. Price, \$1.

Mr. Brown deals with this subject in six chapters, and supplies an index at the back of the book. In the first chapter we are told what enamel really is, and the history and description of enameling is given. Enamel is a thin coating of vitreous glaze applied to some background and forming either a colored ornament or an actual picture. The word comes from the French *email*, originally *esmail*; Italian *smalto*, both from the same primordial root as the Anglo-Saxon word *smelt*. In Chapter II a very interesting dissertation is given on the various kinds of enamels—viz., the *Cloisonné*, the *Champs Levé*, the translucent and the painted. The first of these is the most ancient form. Briefly the *Cloisonné* consists of a flat plate of copper, gold or silver, upon which the pattern is made by brazing thin pieces of sheet copper or other metal, perhaps about 1-16 inch high, to the base plate. These thin upright strips of metal divide the spaces which are to contain the enamel just as fences divide field from field along a country road. The *Champs Levé* method uses a thicker base plate and the divisions are made by cutting out the metal of the plate between them, just as boys might excavate a shallow area of ground in order to hold the water necessary for a skating rink. Rinks of differing shapes, separated by narrow dykes, with ice representing variously colored enamels, would resemble the *Champs Levé* method.

Chapter III refers briefly to translucent enamels, which are described as composed of transparent enamels of every variety of color, laid in thin coatings over the design, which is incised in the metal, the figures being slightly raised in low relief and marked with a graver, so as to allow the drawing of the contours to be seen through the ground. Painted enamels are produced by a process similar to porcelain painting, except that the surface decorated is a metallic one, instead of biscuit porcelain. Next follows a description of the apparatus required for the work of enameling, furnaces and tools and methods. In fact, the book is intended more for the amateur than for the professional worker, though the practical way in which the subject is treated throughout commends it to the skilled hand as well as to the beginner. For instance, the amateur is cautioned that *Cloisonné* requires the worker to be particularly patient and painstaking, as it involves a very considerable amount of trouble and often yields very uncertain results, and the professional will notice what the author says about the possible danger that the "firing" of the enamels may weaken or impair the soldering of the metal divisions to the base and so lead to disaster.

The chapter on the composition and preparation of enamels gives what may be called "receipts," and goes on with the methods of doing the work of coating, "firing," designing and reproducing pictures or designs in enamel.

The last chapter includes designs for *Cloisonné* and painted enamels, and is very satisfactorily illustrated, as indeed the book is all through.

The efforts of amateurs the author clearly has in mind in dealing with this interesting branch of art, though he cautions his readers that its prosecution is exceedingly arduous. Even the mere student of this very ancient form of artistic representation of objects, natural or conventional, will be interested in the brief historical *résumé* which the little book of 58 pages contains. A hint is given, which is not enlarged upon, per-

haps as it might be, to the effect that heraldic devices seem to lend themselves readily, at least, to reproduction in the *Cloisonné* method. Amateurs of sufficient manipulative skill and patience might be able to reproduce coats of arms in enameled plaques, or national emblems, as for example that belonging to Sir Walter Scott's native land, of which he poetically says, "The ruby lion ramps in gold."

THOS. MANKEY & Co. are successors to N. H. Peterson in the Stove, Hardware, plumbing and gas fitting business in Newell, Iowa.

M. E. HOWERY & SON is the style of a concern who have recently embarked in the Stove, Shelf and Heavy Hardware and Sporting Goods business in Penfield, Ill.

EDWARD KENNEDY has lately opened up in the Stove, Shelf Hardware and Agricultural Implement business in Cato, N. Y.

PERFORATED METALS
OF EVERY DESCRIPTION
FOR SCREENS OF ALL KINDS
THE HARRINGTON & KING PERFORATING CO.
217 NORTH UNION STREET.
CHICAGO, ILL., U. S. A.

STEEL, IRON, COPPER, ZINC, BRASS, TIN,
AND ALL OTHER METALS
PERFORATED AS REQUIRED
FOR
GRAIN CLEANING AND MINING MACHINERY,
WOOLLEN, COTTON, PAPER AND PULP MILLS,
RICE, FLOUR AND COTTON SEED OIL MILLS,
SUGAR AND MALT HOUSES, DISTILLERIES, FIL-
TER PRESSES, STONE, COAL AND ORE SCREENS,
BRICK AND TILE WORKS, FILTERS,
SPARK ARRESTERS, GAS AND WATER WORKS,
OIL, GAS AND VAPOR STOVES,
COFFEE MACHINERY, &c. &c.
STANDARD SIZES PERFORATED TIN AND BRASS ALWAYS IN STOCK.

NEW YORK OFFICE: 114 LIBERTY STREET

THE CHANCE OF A LIFETIME.

A first-class Plumbing and Heating Business for sale in an up-to-date Southern city of twelve thousand inhabitants.

The city has water and sewer mains on almost every street, also gas mains.

Plenty of building going on and plenty of work on hand.

This is a chance for some one to step into a safe and paying business, without any extra expense.

There is only one other shop in town, and they are members of the Master Plumbers' Association.

The proprietor has other business out of town, and is obliged to give up one or the other.

Inventory of stock about three thousand or a little over.

Climate unsurpassed.

National Union Building, 918 F St

— "SILENCE," said the man who quotes, "is golden."

"Well," answered Colonel Stillwell, "I don't know about silence being golden, but I must admit that I know of several people in the mountains who have made considerable money out of a still."—*Washington Post.*

— BAD MEMORY.—"Sailors are awful forgetful, pa, ain't they?" said little Elsie.

"Why do you think so, dear?"
"Because," said she, "they have to weigh the anchor every time they leave port."—*Philadelphia Press.*

— CONTRARY TO SCRIPTURE.—"You are in my pew, sir," said Mr. Upjohn, stiffly.

"Then I am sitting in the seat of the scornful!" replied the stranger, getting out of it with alacrity and taking a seat farther back in the church.—*Chicago Tribune.*

LIBERTY LANTERN.

Easy Light. Steady Light.

Simplest and Surest of All.

TRY IT.

Manufactured by

WILLIAM VOGEL & BROS.,
BROOKLYN, N. Y.

WARREN McARTHUR, Chicago, Exclusive Sales Agent.

DIETZ BLIZZARD DASH LAMPS

There is a great demand for Dash Lamps giving a large amount of light, and which will stay alight under all circumstances.

Our Blizzard Dash Lamps answer these requirements, and in addition are convenient to operate and strong and durable.

Insist on your jobber furnishing Dietz Lanterns and **no others.** They are always safe and reliable.

If you haven't received a copy of our fine new catalogue ask for it.

R. E. DIETZ COMPANY,

FENN'S ROTARY VENTILATOR..

For ventilation, the best.
For smoky chimneys, a sure cure.
Made in two grades, 4 in. to 30 in.
SEND FOR CATALOGUE.

GEO. E. FENN, BOSTON, MASS.

—EASILY RECOGNIZED HERSELF.—It was in a Beacon Hill parlor. He said: "I have long searched for the true, the beautiful, the good, the—"

And she interrupted, "I comprehend, dear Cecil, what you would convey. My reply is in the affirmative."—*Philadelphia Press.*

—EXTREMELY SPARE.—Subhuhs (on a visit to Citiman): "I thought you said you had a spare room in your flat."

Citiman: "This is it."

Subhuhs: "What! this closet? Why, this is barely 4 feet square."

Citiman: "Well, what could be more spare than that?"—*Philadelphia Press.*

—PROBABLY WILL.—Customer: "Are you sure this is a good cook book?"
Salesman: "Yes, indeed. They're talking of dramatizing it."—*Judge.*

—RETORT COURTEOUS.—"I never get angry with a fool," remarked a man who wanted to crush his antagonist.

"That," rejoined the other, "accounts for your always being on good terms with yourself."—*Chicago News.*

The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

M F
Roofing Tin

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This  mark stamped on every sheet. Ask your roofer, or

CATALOGUES ON APPLICATION.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.

96 inches long.

Our Improved Eureka Cornice Brake. Will bend No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS. With Lever Arc, Automatic Gauge. Will cut No. 21 iron 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

Speaking of Furnaces

Do you know that the Glenwood line is one of the largest in the United States, and is composed of five popular selling grades with sizes ranging from 16 to 34 inch pots, including furnaces for coal, furnaces for wood, combination warm air and hot water heaters, made portable style or for brick setting. Our heating engineer is available for consultation when planning the heating and ventilating for schools or large public buildings.

ASH BARRELS

tell a very interesting story. The man who uses a Paragon Furnace never has to sieve his ashes and his ashes will always be very fine and free from clinker. His neighbor who uses some other furnace will be obliged to sieve his ashes and his ashpit will contain clinker and unburned and partially burned coal. The "Equalized Draft" makes the difference in the Paragon. The draft passes through the mass of fuel evenly at all points thoroughly consuming the fuel and getting out of it all the heat that is in it. Why don't you sell the Paragon?

QUICK MEAL

STEEL RANGES

Quick Meal Steel Ranges do the Work

Quick Meal Steel Ranges Hold the Heat.

Quick Meal Steel Range Bodies are constructed entirely different from the bodies of other ranges. Either end of the range, the Back Flue or the bottom of the Oven Flue can be removed and replaced without injury to the balance of the body, as they are locked together by lock joints and fastened by bolts. The sheet steel used in the outside wall of the ranges is extra heavy and lined with a double thickness of asbestos board and an extra heavy sheet steel lining. This holds the heat and makes the body strong and durable.

QUICK MEAL STEEL RANGES GIVE
THE BEST OF SATISFACTION.

SINCE 1830 MAKERS OF CELEBRATED FURNACES, RANGES AND STOVES

THOUSANDS IN USE

RECORD EVERYWHERE ESTABLISHED

References to Many of Our Furnaces, Now and Through Past 25 Years in Continuous Service

COMET
Heavy Steel Drum

Both furnaces are well made—all exposed parts heavy. *A generation of constant service establishes their record for durability*, economy, powerful heating, easy to set, simple to operate.

The radiator of the STAMFORD ALL CAST FURNACE is a combined dome-tubular and cylinder construction of immense capacity and heating power.

The COMET radiator is made of heavy cold rolled steel. Fire pot and exposed parts especially heavy and durable.

The COMET is made for satisfactory service and not for PRESENT cheapness, ENDING IN EARLY DESTRUCTION.

OUR GUARANTEE follows everything we make, whether stoves, ranges or furnaces, and is established by our over 70 years' record.

STAMFORD All Cast
Portable or Brick Set

This is the Celebrated American Improved

Send for Catalogue, Capacities and Prices

THE STAMFORD FOUNDRY COMPANY
STAMFORD, CONN.

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

Rear Guard, Forward! SUNRAY HEATERS.

There was a time when the "Sunray" Heater was not so well known. But, nowadays, when a heating man wants to "do himself proud" he always talks "Sunray" to his customer. Why? Simply because he knows they are the best, and acknowledged as such by experts. We charge nothing for the name—that's another good quality. Better write to-day and get prices. You'll not be sorry.

PEORIA, ILLS.

Perfectly Natural.

A keen observer recently remarked that what displeased him most was to see people try to be what they are not. You're seemingly obliged to sell some apparatus on that basis, but never

"GURNEY" HEATERS,

BRIGHT IDEA, 400 SERIES and DORIC.

You may claim what we claim for them in the fullest confidence. It's never necessary for you to stretch their efficiency, their durability, or their economical fuel consumption. It's never necessary to make any misstatements about their ratings, for each heater is honestly rated and will do exactly what we claim for it. "Gurney" Heaters, by the way, are sold, not on "saying" but on "doing."

You won't have to look far to find people right in your locality who'll help you sell "Gurney" Heaters by their recommendation of them. Write for latest catalogue and agents' particulars.

L. J. MUELLER FURNACE CO.,

180 Reed St.,

Milwaukee, Wis.

SUPERIOR Furnaces and UTICA Heaters require less care and attention than any other furnace on the market. There is no complicated system of drafts and dampers—merely pulling one chain in the living room will open the drafts, pulling the other chain checks the furnace. “A Child Can Do It!”

SUPERIOR Furnaces and UTICA Heaters respond quickly and effectively to change of dampers. They're built that way.

Ask for our new catalogues—just out.

The New WALKER BOILER for Steam: for Water

Our boilers for either Steam or Water Heating will extract more heat from a shovelful of coal and keep the radiation warmer and at a more even temperature than any other boiler. Why? Because every part of its highly effective heating surface in the fire box, or over the fire, is exposed to direct heat. Boilers are fitted with all best and latest improvements, easy to clean flues and to operate. We want you to become acquainted with our productions. It will pay you. Burn any kind of fuel.

SOLD ON THE HONEST RATING PLAN.

310	31 "	62 "	52 "	135 00	17 00	7 50

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel.

The general type of construction is exactly the same as the regular "DIGHTON" which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once.

The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the fire is thoroughly cleaned.

If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

DIGHTON FURNACE CO., Taunton, Mass.

GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

Common Sense Circulator and Radiator.

(Patent applied for.)

This Heater is so simple that its
superiority over all others is
plain. Being open at each
end the cold air is taken in
at the bottom, passing out at
the top heated; producing a
circulation unequalled by any
radiator. Is easily cleaned
or repaired. Takes the place
of a joint of pipe. Diameter
of casings, 10½ and 12½
inches. Send for prices.

change.*

I can hold my hand over my chimney. No waste heat. I use a Rochester Radiator and save half the fuel.

THIS shows the construction of the ROCHESTER (stove-pipe) RADIATOR.

THIS has been advertised extensively for years.

THIS is the one your customers have frequently asked you about.

THIS is built like a steam boiler.

THIS has 9/10 of its radiating surface directly over the hot current, where every square inch of surface is as effective as six at the side.

THIS gives the results that have so surprised those who have used them and induced our patrons to do so much missionary work for us. Your patrons will gladly do it for you, if you give them the opportunity. Get a few started and after that they will almost sell themselves

HENRY N. CLARK CO., 56 and 58 UNION ST., **Boston, Mass.**

Semi-Sectional View.

Every Practical Stove Dealer

knows that heat without circulation is valueless. The best circulator gives the best heat.

New Era Radiators have **perpendicular** tubes. They take the cool air in at the bottom and rapidly heat it in the natural way **as it ascends**. Their construction tends to **increase** circulation instead of **retard** it, as tubes in any other direction would. All the products of combustion are compelled to touch the outer or inner surface of the tubes and the maximum amount of heat is radiated and circulated throughout the room.

If you would sell the best Radiator, you must buy the best. "**New Eras**" are best in material, best in workmanship, best in appearance, and best in results. Made in three styles and many sizes. Prices are right, affording a large margin. Don't buy something cheap on which you make but little. People are willing to pay a fair price for a good article. Send for our inducements now and be prepared to talk **New Era Radiators** at the right time.

WILMOT CASTLE & CO., - 76 Elm Street, Rochester, N. Y.

The Torrid Zone Furnace

is a trade winner because it has points of merit peculiar to itself that can be found in no other steel furnace. Our new catalogue is now ready to mail and a description of our Hot Air and Hot Water Combination Furnace can be seen in it. We furnish either the cast iron lining or the fire brick at the same price. Our Wood Furnace is called a powerful heater by those who use it.

Pig Iron Production Reduced.

The effects of irregularity in the fuel supply, caused by the anthracite coal strike, are exhibited in a reduction in the pig iron production of July as compared with that of June. The monthly blast furnace statistics of *The Iron Age* show that we entered August with a weekly capacity of 336,465 tons, as compared with 350,890 tons on July 1, caused chiefly by the blowing out of a few large furnaces in the Central West. In spite of the fact that July was a month of thirty-one days, the production of pig iron was only 1,476,000 tons, and from the present outlook it seems likely that August will show a further reduction. Meanwhile the demand for pig iron keeps up in large volume and a majority of the furnaces are practically out of the market, having sold their output for many months to come. It is reported that three-fourths of the output of the furnaces of the South up to the middle of next year is already booked, while the principal Northern furnaces can take very little more tonnage for the first half of 1903. These facts illustrate the stringent conditions already prevailing in the iron market, and these conditions will be necessarily emphasized by a further decline in the production.

Acetylene and Insurance.

One of the most important subjects ventilated at the annual meeting of the International Acetylene Association in Chicago this week was the obstructive attitude of the insurance companies toward this industry. Those who are engaged in the industry may feel encouraged, however, in view of the experience of the manufacturers and users of gasoline stoves. Through the sheer force of its merit the public have decided to use gasoline for fuel regardless of the interests of the insurance companies, and the narrow, selfish restrictions that were originally placed upon the use of gasoline goods have had to give way to the common sense which was the basis of its adoption by the people. It is fortunate that acetylene as an illuminant has also intrinsic merit that is readily discernible and quite generally appreciated. While it may be exasperating to those who have expended much effort in the introduction of this new method of lighting to have their energies still further taxed by the obstructive methods and restrictions of the insurance companies, the course to be taken, as reflected in the resolution to organize, or patronize special companies who will look more favorably upon acetylene apparatus, follows in the footsteps of the gasoline stove trade, and promises to be equally successful in forcing

a recognition of this useful apparatus by these ultra-conservative insurance concerns. The action taken is in the right direction and is worthy of the support of every one identified with the acetylene trade, whether members of the association or not.

Undesirable Immigration.

Food for thought is presented by the immigration figures for the fiscal year 1902. In the first place, the movement of foreigners into this country during the twelve months broke all records. The total was 648,743, or 33 per cent. more than in 1901, 45 per cent. more than in 1900, 208 per cent. more than in 1899 and 283 per cent. more than in 1898. In quantity, the record is unsurpassed. Unfortunately the same cannot be said in regard to the quality of immigration. On the contrary, deterioration of quality has marked the immigration of the past twelve months. Of those over fourteen years old, who were entered, 28.7 per cent. were illiterate. This is the highest rate of illiteracy in the records of the Immigration Bureau. Another feature that is far from gratifying is the fact that more than one-half the immigrants—54.6 per cent.—came from Southern and Eastern Europe, the countries that send us the least desirable type of embryo citizen. This is by far the largest percentage of immigration that has come in any year from the regions referred to. The number of Southern Italians, the least enlightened and profitable portion of that country, increased from 65,600 in 1899 to 152,900 in 1892. The number of Poles rose from 28,400 to 69,600 and the number of Slavs and Croats from 24,400 to 67,100 in the same period. It is worth noticing that representatives of the three last named nationalities are conspicuous among the disorderly element in the coal regions at the present time. Moreover, it is these Eastern European immigrants who swell the total of illiteracy. For example, 42.2 per cent. of the Slavs and Croats over fourteen years old are shown to have been illiterate and 54.1 per cent. of the Poles. The exhibit is not very reassuring. Two-thirds of a million foreigners coming into the country in one year and nearly one-third of them illiterates and practically paupers. Furthermore, over 69 per cent. of them settled in New York, Massachusetts, Pennsylvania and Illinois. It has become a really serious question as to whether the country can properly digest and assimilate such a mass. Surely measures should be taken to check this influx of undesirable immigration. In the interests of American labor, apart entirely from the question of labor unions, it seems that a wholesale invasion by the class indicated above, such as is now going on, should have some sort of limit. Why should America be made the dumping ground of the residue and offscouring of the nations?

Are You Ready?

No very keen perception is needed to see that the workmen who are sent to do the most important work and receive the highest wages, the salesmen who have the best territory and draw the largest salaries, the business men who have the best trade and own their own stock and fixtures, are those who are ready to seize the opportunity when it offers and to meet the demands that

emergencies may make upon them. A very pertinent question, therefore, is, "Are You Ready?" The getting ready is a process that never stops. The workman who feels that he is entitled to good wages when he has mastered one branch of trade is not likely to make very rapid strides up the hill of success. The territory which contains the largest and shrewdest buyers is not given to those salesmen who are not possessed of as much practical information as those who buy from them. The business man does not attract a large clientage of customers to his store unless his information covers a far wider field than his everyday stock represents. The man who is sure to overtake success is the one who, after mastering one problem, is immediately on the lookout for some other problem, either of a kindred type or having no direct bearing on his everyday work. The young man, in particular, whose greatest capital is his time, experience or knowledge, increases in value to himself and to others when, in addition to his varied fund of information, he has also learned how to sell his services in whatever field is paying the best price.

It is not enough for a workman to confine his knowledge of mechanics to his own trade alone. His opportunity may be an emergency, when a man who is familiar with the details of some other branch of trade will be invaluable. Those who find pleasure in acquiring knowledge, not only in their own sphere but in whatever other field of usefulness may be brought to their attention, acquire an alertness of mind that fits them to manage operations in which a broad view of affairs and wide information are necessary. The salesman who has made a mental memorandum of all the business men of large buying capacity in whatever line in his territory, and is acquainted with the methods of selling their goods used by men in different lines of trade, is much more likely to be selected to manage the sales department of a large concern than one who has not been so careful in getting ready. The business man who has taken the opportunity of acquiring knowledge of the goods that are necessary to supply the people of his community, even though they may be entirely outside of this line, will be most useful to his customers. His business will naturally broaden with his information and the profits will increase accordingly. Even as "eternal vigilance is the price of liberty," so the continual getting ready is the keystone of success in any branch of business life.

The growth in the importation of manufacturers' materials and the increasing share which such materials form in the total imports are the most striking feature in the record of foreign commerce of the United States in the fiscal year lately ended. Manufacturers' materials, in the fiscal year 1902, supplied nearly half of the total importations and showed a remarkable increase over the preceding year, whereas other classes of imports showed but a very slight increase. Comparing conditions in 1902 with those of 1892, an increase is shown of about 50 per cent. in the imports of manufacturers' materials, and a decrease of about 10 per cent. in other imports. In 1892 the importations of manufacturers' materials were valued at \$278,311,900, against \$418,776,680 in 1902, while the imports of articles other than manufacturers' materials were, in 1892, \$535,281,380, and in 1902, \$484,550,319. These figures are especially interesting in view of the fact that the total imports of 1902 were larger than in any previous year in the history of our foreign commerce. They offer a striking illustration of the activity of our manufacturing industries last year as compared with former seasons.

Evidences of appreciation of the efforts made to give the readers of *The Metal Worker* timely and valuable information are usually gratifying. It is pleasant to re-

ceive acknowledgments of the benefit derived from a perusal of our columns. Greater zeal in endeavoring to make the paper still more interesting is thus enkindled. But sometimes the evidence of appreciation is not altogether satisfactory. For instance, we find in the *House Furnishing Review* for August an editorial reproduced from *The Metal Worker* for July 5 without a line of credit. That the article was highly appreciated is shown by the fact that it appears as the leading editorial in the journal named. We are pleased to have our contemporaries draw freely from our columns, but we protest against the reproduction of our articles without credit. We trust that in this case the failure to mention the source of the article was not intentional, but simply an oversight.

World's Fair Power Plant at St. Louis.

Work has begun on the foundations for a tower to carry the electric wires in the Palace of Machinery, where the great power plant is to be situated. The big switchboard will be placed high on the western end of the Machinery Palace, accessible only from the special gallery. The tower, whose foundations are well below the surface of the ground, will connect the switchboard gallery with the electrical subway, which is 7 x 7 feet and 1 mile long. From this subway the service conduits lead out in all directions to all buildings and all parts of the grounds where electricity is to be used either for power or lighting. Over 100 miles of wooden conduits have been bought for this purpose. The foundation for the tower will be concrete, and the walls will be lined with fire proof tile.

The power plant in the western end of the Machinery Palace will develop by means of four immense Westinghouse steam driven generators 8000 kw., the equivalent of 10,720 horse-power. The Exposition has also arranged to buy 7500 kw., or 10,050 horse-power, from the Citizens' Light & Power Company, making a total of 20,770 horse-power. Two thousand horse-power will be developed from exhibit plants in the Machinery Palace, which will be used by the Exposition for a variety of purposes. All power used by the Exposition will be controlled from the one great switchboard. Such an unusual volume of power is necessary because of the great number of moving exhibits in many of the buildings and the extensive electric lighting and cascade schemes. The intra-mural railroad, several miles in length, will also require a large volume. The boiler house will be situated 150 feet west of the Machinery Palace, and will contain a battery of boilers of unusual size and steam capacity.

Electricity for Cultivation of Plants.

United States Consul-General Richard Guenther of Frankfort, Germany, quotes a Frankfort journal describing experiments made by J. Fuchs, a wine producer of Elba, in the use of electricity in grape culture. He planted, some years ago, four fields with native grapevines, in the midst of a district infested with phylloxera, and treated two of these fields with "air electricity." The difference in the development of the grapes of the fields was apparent; those treated with electricity yielded better results, both in quantity and quality, and were not infested with phylloxera, while the other fields were.

Mr. Fuchs, says the journal, has demonstrated that electricity increases the fertility of the soil. It is not sufficient to simply conduct air electricity to the earth, but there should be a direct metallic connection of the electric conduit with the main stem of the plant. On a field of about 21½ acres five masts are erected, the tops of which are supplied with an arrangement for accumulating atmospheric electricity. These accumulators are connected with each other by wires. Wires are laid in the soil about 1½ feet deep, forming an evenly distributed metallic net. Every accumulator is connected with this metallic net by a wire running along the mast. Short wires connect with the plants, the free ends being stuck into the stem or into the main root thereof.

AGAIN THE STOVE CAPTAIN.

BY M. D.

Notwithstanding the somewhat facetious comment of another contributor, the article entitled "A Stove Captain Needed," is exactly pertinent to the situation. That manufacturer believes just as others do who have read the testimony of Mr. Schwab. The salvation and prosperity of the stove industry depend upon systematic business methods, which can best be reached through organization. "Every man for himself" is—well, Washington said, "Anarchy is the severest of despots." An iron clad rule is better than no rule; but to give force to any rule those who are to observe it must be subject to some stronger power than the out of date "gentlemen's agreement."

It is probable that those who favor a "stove combine" are weary with the efforts to reach an agreement that would prove profitable, and the failure to carry it into effect. They recognize the fact that further efforts to secure united action that would bring living profits to the stove trade would be futile. Hence they favor the combine which would have a hold on every fellow's purse strings, for the good of all; or, the skeptic might add, for the good of those who can manipulate it for their personal prosperity. But, so far, enough of the stove manufacturers have not favored the combine to carry it into effect. The men have got to be imbued with the spirit of the cause before they enlist, and until they enlist the captain is of less necessity than the recruiting officer. However, a captain who wants a company, and in whom the men have confidence, can exert a strong influence to draw them in.

There can be no doubt that the captain can be found; but if he is well known, of the right capacity and possessed of the essential qualifications, he will probably be found running his own business very profitably without too much exertion, and will be indifferent to the taking up of a task that promises to tax his greatest powers, largely for the benefit of others who are not securing the cream of what some are pleased to designate as a declining trade, at least so far as heating stoves are concerned. There are readers of *The Metal Worker* who know the men at the head of the stove industry to a hair's breadth, and they might, if they favor the combine, send in their nominations for "A Stove Captain." If it did no other good, it would at least show some of our prominent men what their competitors think of them, and that too while they live and before it is too late for them to enjoy the gratification.

THE PENNSYLVANIA STOVE TRADE.

Trade conditions among the stove manufacturers and dealers in Philadelphia and vicinity are considered satisfactory. The very favorable conditions of the first half of the year, however, are not likely to be repeated during the second half. The anthracite coal miners' strike has crippled the trade in the mining districts to a very large extent, and even if an early settlement was reached between the operators and miners the effect on the trade would be too late for any material benefit during the coming season. The shortage of pig iron as well as fuel has been the cause of a great deal of anxiety on the part of manufacturers, and deliveries on some lines of goods are pretty far behind. The first six months showed in almost every instance an increase in business over the previous year; in some instances it was as high as 75 and 80 per cent. Orders on the books of some concerns at this time are numerous and represent in instances, almost the capacities of the plants on some particular lines. The manufacturers, however, are not so well satisfied that all these orders will remain on the books. Many have already been countermanded, and if the anthracite miners' strike continues for any length of time there is a prospect that many more will be, or at least that shipment will be deferred for some time.

The trade in the anthracite region is practically done for this season, and in the general territory about Philadelphia the price of fuel has advanced to such figures

that in many cases its use will be almost prohibitive and the old stove will be compelled to go through another winter's campaign because fuel is so much higher.

Trade in gas and gasoline stoves has been very brisk all the summer, this branch of the trade having been materially benefited by the shortage and price of coal, and some difficulty has been occasioned by the inability to get prompt deliveries.

With the improvement of the coal strike situation will come a better condition of the stove trade. At present the trade are quietly awaiting that event in the hope of improved general conditions and orders for shipments of goods.

Mott's Ranges and Furnaces.

A handsomely printed catalogue has just been issued by the J. L. Mott Iron Works, 84-90 Beekman street, New York City, in the interest of their coal and gas and combination coal and gas ranges, fire place heaters, gas ranges and hot air furnaces. The catalogue is specially well adapted to help those who are catering for the work of architects and builders. It is illustrated by handsome half-tone engravings, the first showing the Defiance combination coal and gas range, which is especially adapted for use in fine residences. The picture shows the oven for the coal fire on the left, with the fire chamber between it and the gas oven on the right, giving it the appearance of a large double oven range, with a large warming closet above it. There are six holes over the coal range, two being immediately over the fire. The fire chamber is provided with a large feeding door and equipped with a labor saving grate with a sifter grate and a large ash pan below it. The gas range has four burners on the top, with a large oven and a broiler beneath. A broiler is also provided above the range, increasing the cooking capacity. The range is equipped with a gas water heater for use in summer when the coal range is not running. Pictures of the various parts, with detailed description, enable this fine new cooking apparatus to be thoroughly understood.

The Claremont is a single oven coal range, with a complete gas cooking apparatus, including broiler and oven above the four cooking holes on the top of the range, provided by a gas hot plate, which can be let down on the top or swung up against the back when not needed. Several pages show a variety of French ranges for fine residences and hotels and for yachts and ships, being made in sections so that they are capable of being extended to provide any desired cooking capacity. The regular Defiance cast iron range, of the double oven type, is shown with high closet and set between jambs, and also with canopy.

A number of pages are devoted to the New Defiance range with single oven right or left fire, equipped with oven thermometer and all the modern conveniences. The Claremont single oven range is also shown in a variety of styles, and several pages are occupied by Mott's gas ranges, with oven and broiler below, or a broiler on the side; also some with a gas water heater on the side. The Social and Osborne fire plate heaters are handsome in design and well calculated to meet the requirements of those who cater for a high class of trade.

Mott's Star and Comet hot air furnaces, both portable and brick set, are shown in a variety of sizes. The construction of these furnaces not only presents a large air heating surface, but also provides for a long fire travel to secure both economical and effective heating. The catalogue presents a fine line of high grade goods and should prove interesting to the trade.

An 18-page pamphlet sent out by Janes & Kirtland, 725 to 727 Sixth avenue, New York City, sets forth the merits of the Beebe Ranges and Furnaces, which are manufactured in extensive assortment. The Ranges are made both right and left hand and in portable form, as well as for brick setting. Some are shown with gas cooking attachment, while others have hood and plate shelf. Accompanying the pamphlet is another describing the Beebe Furnaces, which are also made both in portable form and for brick work.

Combination Gas or Vapor Valve.

Fox & Guese, 1½ Ashley Block, Michigan and Jefferson streets, Toledo, Ohio, have brought out the combination gas valve herewith illustrated and have made application for a patent. This valve is designed for use in operating gas ranges. The construction is such that a single wheel valve will control four burners or less, thus

Combination Gas or Vapor Valve.—Fig. 1.—Application of the Valve to a Range.

avoiding the use of the separate valves and a great deal of the piping now found on gas ranges. This valve has four ways for the passage of the gas through a hollow key which is drilled to correspond with an indexed wheel.

Referring to the illustrations, Fig. 1 shows the application of the valve to a range. Fig. 2 is a longitudinal

Fig. 2.—Longitudinal Section of the Valve.

section of the valve, showing the arrangement of the holes in the hollow key for the passage of gas to the pipes connecting with the burners. The pipes are lettered to correspond with the lettering of the burners on the range. Fig. 3 shows the arrangement of the holes on the hollow key, the same lettering being continued.

Fig. 3.—Arrangement of Holes on the Hollow Key.

This shows how the turning of the wheel shuts the gas off completely; operates separately burner A, B, C or D; operates two or three burners at one time, or operates all of them. Fig. 4 shows the valve and its parts, 1 being the valve complete, 2 the indexed wheel, 3 knurled nut for holding the key and take up, 4 the hol-

low key with drilled holes to suit the indexed wheel, 5 the shell provided with a ½-inch pipe thread, 6 screw for holding the indexed wheel on the key shank and 7 a leather gasket. The valve can be turned either way,

Fig. 4.—The Valve and Its Parts.

an index finger on the side of the shell showing how the wheel is set.

St. Clair Stoves and Ranges.

In a green, flexible cloth cover bearing a design showing the trade-mark of the St. Clair stoves and ranges, the Belleville Stove Works, Belleville, Ill., are sending to the trade a 184-page catalogue of their latest products. The catalogue opens with some important information about the risk of shipments, terms, instructions for settling breakages with the railroad companies and directions for setting up their apparatus. The first place in the catalogue is given to the St. Clair steel ranges, which are made in a variety of styles for hard and soft coal and wood, with reservoirs and hot closets, one range being shown as a combination coal and gas range. The Florence, the Columbia, the Household, the Active A and the St. Clair are ranges of similar construction and excellence. The Century, Sterling, Splendid and Select are steel cook stoves of the leg type and of a variety of styles and equipment. The next section of the catalogue, which is devoted to cast iron ranges, opens with the Monarch St. Clair, which is furnished with all the usual conveniences and appurtenances of high grade ranges. The Pacific St. Clair and Comet St. Clair are small square ranges, with six and five holes on the top and with end ash pit. The Novel, Coral, Wonder, Empire, Agate, Welcome and Crown are other square ranges of varied design and capacity, giving the dealer who handles this line a great variety to offer to his trade. Thirty-eight pages following are devoted to flat top cook stoves, the line including a great variety for both hard and soft coal and for wood burning, with reservoirs and high shelves, and adapted to meet the requirements of a varied trade.

The parlor stove section shows the Sterling, Charm, Laurel, Incandescent, Prominent and Capitol St. Clair. Some of these are of the self feeding and others of the air tight type, and all are of handsome design and elaborate embellishment. The catalogue also shows a variety of oak stoves and air tight heaters, followed by open fires and globe and laundry stoves. The last pages are occupied by a great variety of wood burning stoves of the air tight and box type, followed by tea kettles, spiders, sugar kettles and tin trimmings, also elbows, dampers and stove supplies. A few pages are devoted to cuts, that can be furnished for advertising purposes, and broken views are given of different types of stoves with the parts numbered and named to aid in securing repairs without the annoyance of errors.

THE MOUNTAIN CITY STOVE COMPANY of Chattanooga, Tenn., are erecting a new warehouse.

Reineke-Wilson Company.

In "Trade Topics," a little publication issued from time to time by Reineke-Wilson Company, Pittsburgh, Pa., the growth of their business from its establishment in 1870 is described. In June, 1899, the old firm were merged into the present incorporated company, the plumbing and gas fitting branch of the business was dropped and the company confined themselves entirely to wholesale and retail merchandising. In a general way the business is divided into three departments, chandeliers, gas appliances and pumps, the demand for which has developed to such an extent that eight four-story buildings, aggregating 38,000 square feet of floor area, are now occupied by the company. In their gas appliance department are handled ranges, heating stoves, fire place heaters, furnaces, burners and all supplies and appliances for natural and artificial fuel gas. Their new factory at Johnstown, Pa., the Century Stove & Mfg. Company, will be devoted exclusively to the manufacture of goods for this department. In the pump department are handled pumps of all kinds, wind mills, tanks, hydrant or garden hose, lawn sprinklers, &c.

The Dayton Adjustable Stove Pipe Thimble.

Among the specialties manufactured by Kramer Brothers, proprietors of the Dayton Stove Repair Works, Dayton, Ohio, is the Dayton adjustable stove pipe thimble, a broken view of which is given herewith. As will be seen by the cut, this thimble is provided with

Dayton Adjustable Stove Pipe Thimble.

a coil spring adjustment. The thimbles are made in diameters of 5, 6 and 7 inches, with 4 to 8 inch and 6 to 12 inch extensions, making six separate sizes. The ceiling and register plates which go with the thimbles are provided three plates to a set, in 5, 6 and 7 inch diameters.

ODD PLATES.

W. H. COLEBROOK, SONS & Co., Syracuse, N. Y., are sending out another of their unique advertising cards in the interest of Colebrook's Crown Asbestos Furnace Cement. Attached to the top of the card is a pair of spectacles, with eyes looking through them, and the legend "Put on your specs and peer into the merits of Colebrook's Cement."

"A PRIMER ON HEATING," that will be of special interest to the Furnace trade, and a catalogue of the Stamford Hot Air Furnaces have been received from the Stamford Foundry Company, Stamford, Conn. The primer not only gives a clear idea of the construction and operation, but also a detailed description of the Stamford Hot Air Furnace. It will also enable those who sell Furnaces to explain many of the features that are of greatest interest and importance to the purchasers. The 12-page catalogue is devoted to this Furnace, which is an all cast iron construction, and is also made as a Combination Hot Air Heater and Hot Water Heater. The Comet, a high grade Furnace of the return flue steel radiator type, is also given several pages of description and illustration.

THE MISSISSIPPI VALLEY STOVE WORKS, Clinton, Iowa, have resumed operations with a full force, after their temporary shut down. The company are well supplied with orders to keep them busy until the Christmas holidays.

THE MINNEAPOLIS STOVE COMPANY, Minneapolis, Minn., contemplate having a large exhibit at the Minnesota State Fair for the benefit of their customers and the retail trade. The exhibit will cover their entire line of Stoves and Ranges.

A VERY pretty bit of trade literature, under the title of "Homes of Comfort," has been issued by the Thatcher Furnace Company, 240 Water street, New York. It is written in a very entertaining manner and is enlivened with choice selections of verse. The early history of house heating and an account of the invention of the primitive cast iron apparatus used for this purpose lead up to the essential modern features that are possessed by the Thatcher Warm Air Furnace. The text is enlivened by handsome half-tone engravings of old fire places and of Dr. Franklin and his inventions, and the progressive story is graphically told until the modern Furnace warmed and ventilated home is presented. Many luxurious residences heated by the Thatcher Tubular Furnaces, which have stood the test of more than half a century, are also illustrated. The distribution of this little booklet should tend to an increasing use of the Thatcher Furnace heating system.

A DISPLAY POSTER, which is being sent out by the Michigan Stove Company calling attention to Garland Stoves and Ranges, is intended for pasting along the curb, on fences and in fact any place where there is room. The posters are long and narrow in shape, and are printed in a variety of colors. They are graphically described by the company as "gutter snipes."

A NEAT four-page folder published occasionally by Walker & Pratt Mfg. Company, Boston, Mass., and known as the *Crawford News*, presents a great deal of matter relating to Crawford Stoves and Ranges, which are manufactured in sufficient variety to meet all reasonable requirements. The first thing to greet the eye of the reader, as he scans the first page of the folder, is the statement that this year's Crawford Oak Stove has a new feature in the shape of a nicked skirt or screen, which is detachable on the same plan as the removable rails of Crawford Ranges. The skirt is made of four sections, each part lifting off separately. This, it is claimed, will be the novelty of the season in Oak Stoves. Another taking feature of the folder is the ground plan of the company's factory, with recent additions shaded in red. Their buildings cover about 3 acres of ground and afford exceptional facilities for manufacturing the various lines of Crawford goods.

THE RICHMOND PATTERN WORKS, Richmond, Va., of which E. M. Liphart is proprietor, announce that owing to the demands of their large and constantly increasing business they have been compelled to extend their manufacturing facilities. They have therefore purchased a commodious establishment on North Eighteenth street, where they will conduct operations in the future. Their machinery and entire equipment are of the modern type, and with increased facilities the concern will be able to turn out their product with greater ease than heretofore. Attention is given to all kinds of Pattern work, from the simplest to the most intricate design. As the company put it, "No order is too small for our best attention—none too large for our capacity."

THE B. C. BIBB STOVE COMPANY, Baltimore, Md., have remodelled and improved their Arcadia line of Ranges for this season. This line has been on the market for the past 15 years, and has had a large sale and gained a good reputation with the public. It is made in three sizes, as a five-hole Range, under the name Arcadia, with 14, 16 and 18 inch ovens, the 14 and 16 inch having 7-inch boiler holes. When sold as a six-hole Range it is only made in two sizes, with 14 and 16 inch ovens; this style is called the Cecil. The five-hole size when sold with water back is called the Geymont, and the six-hole style with water back is called the Avalon. Selling the Ranges thus under different names avoids any danger of mistakes in ordering repairs, as is the case when styles and sizes are all named alike.

CHAS. C. HEATH & Co., Philadelphia and Baltimore, have adopted an excellent way of designating the particular Stove Repairs and Fire Brick shipped by them.

Carefully affixed to each article is a special tag bearing the name of the Stove for which the part is intended. This plan is of particular advantage when a number of parts are shipped for different Stoves at the same time, and it will no doubt be appreciated by the purchasers of Repairs as it obviates the confusion and mistakes liable to occur when these goods are shipped by the old methods.

S. P. HUMPHREY, Ironton, Ohio, is erecting a foundry, 50 x 75 feet, with adjoining building 25 x 50 feet, for the manufacture of small Castings for Stoves, Grate Bars, &c. Associated with Mr. Humphrey are J. C. Snyder and others.

A FEW FACTS concerning Furnaces and Ranges are contained in the 32-page pamphlet, of a size convenient to carry in the pocket, which is being sent out by Floyd, Wells & Co. of Royersford, Pa. The matter consists essentially of an illustrated description of the Bengal, Rosemont and Hope Furnaces and of the City Irving and Home Ranges. The matter is presented in a way to interest not only the dealer handling the goods but the house owner who is thinking of equipping his home with either heating or cooking apparatus, or both. Accompanying the pamphlet is a four-page folder describing the Oak Ringgold, made both as a single and double Heater and intended for using hard coal, soft coal, coke, or wood. The Stove has recently been remodeled, special attention having been given to features requisite to bring it into the front rank of high grade oaks, both in construction and design. The gas generator is a special feature, the device making it possible for the air to be admitted into the fire pot, permitting the oxygen to freely mingle with the gases liberated from the coal. The ornamentation includes the judicious application of nickel, which forms a pleasing contrast with the black iron surfaces.

For the purpose of accommodating their increasing business, the Odin Stove Company of Erie, Pa., are erecting an addition 40 x 60 feet in size.

THE SOUTHERN STOVE WORKS of Richmond, Va., set forth the merits of their leading lines of Ranges, Cook Stoves and Heaters in a neatly printed catalogue of 48 pages which they have recently distributed. Directions for operating Stoves are given, as well as numerous suggestions respecting chimneys, drafts, &c. The Jefferson, which occupies the leading place, is a first-class construction of pleasing exterior and embodying the modern features. The Lexington, a six-hole Range, is offered in several styles and sizes adapted for coal or wood. Other members include the Elko, the Maud, the Afton and the Eli. A substantial four-hole Cook Stove is known as the Fitz Lee, and is referred to as having established a reputation wherever used. A varied assortment of Heaters is presented, as well as a line of Stove Hollow Ware. The gradual growth of their business has compelled the company to enlarge their plant, thus placing them in a position to more promptly than ever before meet the requirements of the trade.

THE advertising department of the Michigan Stove Company, Detroit, is as busy as the proverbial bee issuing novelties, all of which bear the familiar impress of the Garland trade-mark. One of the latest products of this ingenious system is a paper pocket case, under the flap of which provision is made for the name and address of the owner, together with other data for ready identification. The case is large enough to hold a number of documents.

SOME idea of a fiery temperament is gained from a glance at the Bengal tiger used by Floyd, Wells & Co., Royersford, Pa., to typify the latest heat that is developed when their Bengal Hot Air Furnaces are installed by the dealers and the ardent appreciation expressed by customers who delight in their possession.

CHARLES C. HEATH & Co. of 136 and 138 North Second street, Philadelphia, Pa., in soliciting the trade orders for Stove Repairs, make the postal card announcement that they carry in stock Repairs for 20,000 different kinds of Stoves, Ranges and Heaters. They state if the dealer orders from them and saves 200 premium shipping tags they will give him, free, a 1000-mile mileage book on any

railroad. They also announce to the dealer that if he will return the postal card with his order for Stove Repairs they will mail him with their compliments five premium tags. Incidentally they mention the fact that they manufacture Asbestos Wick Rings for all Blue Flame Oil Stoves and are sales agents for the Aluminum and Electric Oil Heaters.

Nebraska Retail Hardware Dealers' Association.

The summer meeting of the Retail Hardware Dealers' Association of Nebraska was held in Lincoln, Neb., on Wednesday and Thursday, August 6 and 7. The meeting was called to order by the president, C. W. Morton of Omaha. After prayer Governor Ezra P. Savage made an address of welcome, expressing his pleasure at meeting so representative a body of Nebraska's business men. The Governor said his first start in business was in a hardware store, and this fact made his feeling toward them of the warmest. Mayor H. J. Winnett, being introduced, welcomed the members heartily to Lincoln and President Morton responded in a happy vein.

President Morton then appointed committees as follows:

NOMINATIONS: M. E. Halght, Crete; L. F. Holloway, Fremont; Henry Veith, Lincoln.

PRESS AND RESOLUTIONS: Frank Hoecker, Friend; Nathan Roberts, Omaha; Max Uhlig, Holdrege; J. C. Cornell, Ord; Ed. Johnson, Clarks.

Sergeant-at-Arms, H. T. Moore of Alma, Neb.

A few informal remarks followed in open session, participated in by Secretary Hall of Lincoln; H. Henke, Grand Island; Nathan Roberts, Omaha; Morris Hussie, Omaha; Henry Veith, Lincoln; J. C. Cornell, Ord; Thomas Bartlett, representing a stove manufacturer; Elmer E. Henkle, representing a Chicago jobber, and others of the members, in which much of interest was discussed, and the meeting adjourned until the next day.

In the evening, according to plans arranged by the Reception Committee, the dealers and their families were furnished complimentary tickets and escorted to Lincoln Park and enjoyed a rare treat in the address given by Gen. Fitzhugh Lee. After the address an informal banquet was tendered by the same committee.

At 8 o'clock on Thursday morning the dealers were taken in a body in carriages to the Experiment Station of the Nebraska State University. The return from the farm was timed so that the meeting was called to order at the State Capitol promptly at 10 a.m.

The minutes of the last meeting were read, and after a short discussion approved. After roll call the secretary's report was read, showing a balance in the treasury of \$146.10.

Letters from absent members were read, and then followed a general discussion. Many of the older members gave practical illustrations of good results obtained by following certain business methods; J. F. Goehmer and S. C. Cook, competitors, of Seward, told of 15 years spent in business enmity, and of three years just past in business friendship, the latter resulting in good to both dealer and customer. It was a lively and enthusiastic meeting. Many questions were asked by dealers who realized the opportunity to get the benefit of some other dealer's expensive experience.

The meeting was called to order at 2.30 on Thursday afternoon by the president. The Press Committee reported resolutions of thanks to various persons for courtesies shown and to the local press for assistance rendered. Reports of the other committees were for the benefit of the members only, and all reports were approved and ordered spread on the records. It was also moved to have all memberships received up to and including August 8, 1902, enrolled as charter members.

The next annual meeting will be held at Lincoln at a date to be decided upon by the Executive Committee. The president appointed as delegates to the National Association Nathan Roberts, Omaha, and Harry J. Hall, Lincoln.

Mr. Corbin, representing Charter Oak stoves, St. Louis, had a fine display of his stoves at the Lindell Hotel, and planned gold plated ranges on the coat lapels

of those who called to see his display. R. H. Riffel, representing the Gold Coin Stove Works, had an elegant display of his 1902 samples, and was kept busy showing the advantages of Gold Coin. The Acorn badges distributed by the representative of Rathbone, Sard & Co. called many visitors to examine the samples, which had been arranged in artistic grouping in one of the parlors of the Lindell. Many other representatives of manufacturers and jobbers were present to assist in making the visitors feel at home and caused members to feel gratified by the interest shown in their meeting.

Cash Prizes to Employees.

The Coldwell Lawn Mower Company, Newburgh, N. Y., each year set aside a certain sum of money to award as cash prizes to their employees for suggestions of a business character, either in regard to their conduct or as to the details of the work. These suggestions may be for improvement in manufacturing, for cheapening the cost of production, or in fact for anything in the way of an improvement in the business

a demand which consanguinity and the voice of justice requires as a safeguard for the employees of the Coldwell Lawn Mower Company.

As many of the suggestions made are good ones, and thoroughly practical, they are generally adopted by the company. From time to time, as the suggestions are made, they are handed in at the office, dated and filed away. At the proper time the envelopes are opened and the winners of the prizes determined upon.

Sometimes it will occur that two men will make precisely the same suggestion, although couched in different words. In a case of that kind the man whose suggestion bears the earlier date is awarded the prize. This system of cash prizes is a highly commendable one and reflects great credit upon the company and proves beneficial to the men in its employ.

The Archer Steel Wheelbarrow.

The Archer Iron Works, Chicago, manufacturers of ornamental and structural iron work, have issued a catalogue with special reference to the steel wheelbar-

Fig. 1.—The Archer Steel Wheelbarrow.

of the company. These prizes are awarded on the first of January and the first of July of each year. The last awarding of prizes was on the afternoon of July 1, when Thomas Coldwell, the president of the company, announced the awards for the last six months. This he did in his usual felicitous manner, speaking in a commendatory way of the men of the works and of their work. The first prize was of \$25. There were two of \$10 each, four of \$5, and four prizes of \$2.50 each. This makes a total of \$75 distributed to employees of the company.

Nearly all of the suggestions made for which prizes were awarded were for something of a mechanical or technical nature pertaining to the manufacture of lawn mowers. But there was one notable exception to this rule. One of the two \$5 prizes awarded to Joseph Coldwell, brother of Thomas Coldwell, was for a suggestion in regard to "First Aid to the Injured." The suggestion on this subject was made in the following words:

As a simple duty that an employer owes to his employees, and as a humane act, I think it absolutely necessary that some measure be adopted by the Coldwell Lawn Mower Company, such as first aid to the injured, whereby in case of accident, which may occur at any time in the factory, there may be an immediate assistance and intelligent help from one or more persons appointed for that purpose, who have had experience and thereby would know just what the emergency required for the alleviation of the suffering of the injured until the arrival of a physician.

Common justice to the employee should dictate that some such method of relief should be adopted at this writing. I have in mind now two persons in the employ of this company who are men of experience and who have had practical knowledge of the first aid to the injured, both having had a course of lectures on the subject, and one being an exmember of the ambulance corps.

I therefore suggest that these two gentlemen be consulted as to the necessary outfit for the first aid to the injured, and that the said Coldwell Lawn Mower Company procure and maintain at their own expense such outfit as may be suggested by the gentlemen referred to. The expense would be light and would meet

rows which they make and shown herewith. The wheels have the Archer tubular barrels, made of wrought iron; the spokes are of $\frac{3}{4}$ -inch round rod, three of which are strongly welded, forming one-half of wheel. These verge symmetrically from bearing to periphery,

Fig. 2.—The Archer Barrow Wheel.

giving a breadth across from hub to hub of 13 inches, which is referred to as a feature of great strength and as preventing upsetting while loading. The rim is made of $1\frac{1}{2}$ x 3-8 inch iron, and spokes are riveted to rim with 3-8-inch rivets.

THE F. H. SMITH MFG. COMPANY, Chicago, Ill., are making the "Best Yet" Riveter, which is made of malleable iron with case hardened steel plunger and anvil. It is provided with an automatic adjustment for different lengths of rivets; is fitted with a pocket for holding rivets; a punch for strap work, and is neatly finished in black japan and gilt. In using the machine the rivet is dropped head downward into the pocket, the work inserted between the pocket and plunger and the lever pressed. The company make a large line of riveting machines, and will send illustrated catalogue on request.

The Degge Air Diffuser.

The air diffuser, shown herewith is for use in connection with electric fans. The castings are nickel plated and the blades are of Spanish cedar. The diffuser is designed to control the draft from the fan, and while in no way lessening the power of the fan in projecting its current of air, it is remarked the blades may be turned so as to spread the current over a wide space, or diffuse it over the entire room, and agitate the air as far as the power of the fan may be able to send it; or the current may be concentrated at any point.

The Degge Air Diffuser.

The diffuser may be attached to any fan, it is stated; also that it is neat in appearance, simple and effective. The device is offered by Degge & Musick, St. Louis, Mo.

Pieced and Stamped Tinware.

Cooney & Geiger, 19 and 21 East South street, Indianapolis, Ind., have issued their illustrated catalogue, No. 7, covering their line of pieced and stamped tinware, sheet iron goods, hollow ware, enameled ware, &c. The catalogue is a substantial book of 160 pages containing a large number of illustrations, and is well printed and arranged. The first 20 pages are devoted to stamped tinware of about every kind known on the market. These are followed by pieced tinware, including wash boilers, tea kettles in tin and copper, coffee pots and boilers, tea pots, sauce pans, pails, dinner buckets, washtubs, sprinklers and measures, milk cans and dairy goods of all kinds, with a long line of cooking utensils and household tinware. Japanned ware occupied the next section of the catalogue. In this department some handsome specimens of decorated water coolers and toilet sets are presented, together with canisters, bread and cake boxes, flour bins and sifters, bath and foot tubs, tea trays, dust pans and a variety of other similar goods. A line of steel enameled ware, including tea and coffee pots, wash bowls, kettles, pudding dishes and sauce pans, milk and rice boilers, water pails, cups, measures, funnels, &c., occupy the next section.

The latter portion of the book shows a considerable variety of miscellaneous goods, including Empire steel skillets and griddles, Acme fry pans, cast iron pots and kettles, ham boilers, waffle irons, bowls and other hollow ware. Then come coal hods, four-pieced and adjustable elbows, Perfect corrugated elbows, stove pipe, ventilators, flue stoppers, roasting pans, dripping pans, stove pipe dampers, coal shovels, poker, lifters and tongs, stove polishers, stove boards, oil cans of various patterns, lanterns, wringers, coffee mills, freezers and a variety of stove supplies. A page is devoted to the company's Centennial rain water cut off, and in the concluding pages are shown a line of table cutlery, carvers, butcher knives, &c. The whole concludes with an alphabetical index of the contents.

Stove and Hardware Dealers.

THE KING CITY HARDWARE COMPANY have succeeded Slemmons Bros. and Lane & Moore Implement Company, both of King City, Mo., and will continue the retail business in Stoves, Tinware, Shelf and Heavy Hardware, Agricultural Implements, &c.

THE CASH HARDWARE STORE, Lewiston, Idaho, have recently increased their capital stock to \$50,000. The company do a wholesale and retail business in Stoves, Shelf and Heavy Hardware, Tinware, Agricultural Implements, Paints and Oils, Glass, Sporting Goods, Harness, Vehicles, &c., and also conduct a tinning, heating and plumbing department. The establishment formerly occupied by the concern was burned out February 14 last, entailing heavy loss. Several months since they took possession of their new warerooms, which front 100 feet on D street and 150 feet on Fifth street, the total floor space being over 40,000 square feet. The arrangement of the main store room is very convenient and attractive, low shelving of neat and original design being a special feature. A well built and convenient gallery encircles the storeroom. The company solicit quotations, &c., from manufacturers in their respective lines, as noted above.

GEO. COE has sold out his business in Athens, Ohio, to F. E. Goldsberry, who will continue the sale of Stoves, Hardware and Sporting Goods at the old stand.

THE Hardware store formerly conducted by Spratt & Haggard, Fairfield, Iowa, is now being conducted under the style of Spratt & Johnson. The line covers Stoves, Tinware, Shelf Hardware, Agricultural Implements, Wagons, &c.

E. L. CONDRON, Portsmouth, Iowa, has disposed of his Stove, Hardware and Farm Implement business to M. J. Schafer, formerly of Dunbar, Neb., who will continue at the old stand.

G. W. BRUSKE, wholesale and retail dealer in Stoves, Hardware, &c., Saginaw, Mich., is building a large addition to his establishment. The new building will be a four-story brick structure, with 50 foot front on Lapeer avenue and 90 feet on Warren avenue. It will be connected with the building now occupied by Mr. Bruske, which fronts 25 feet on Genesee avenue and 25 feet on Lapeer avenue, and is about 100 feet long. It will have all modern improvements, such as electric elevator, steam heat, &c. The ground floor of both buildings will be used as salesroom and office. The other floors and basement will be used as storage and packing rooms. Mr. Bruske commenced business in September, 1867, and the volume of his trade has increased from year to year. With the addition referred to he expects to more than double the wholesale and retail trade now done. The new building will be completed and occupied, it is expected, by October 1.

THE MYERS HARDWARE COMPANY are a new concern at Blackburn, O. T. They are retailers of Stoves, Tinware, Shelf and Heavy Hardware.

FELTUS BROS. have purchased the stock of Geisenberger & Baker, Natchez, Miss., and will continue the wholesale and retail business in Stoves, Tinware, Shelf and Heavy Hardware. Agricultural Implements and Sporting Goods. They have added a line of Paints to the former stock.

MCCULLOUGH HARDWARE & SADDLERY COMPANY have succeeded W. McCullough in the Stove, Hardware, Agricultural Implement and Sporting Goods business in Cleburne, Texas.

W. H. WORDEN, in the Stove, Hardware and Farm Implement business in Garnett, Kan., has been succeeded by Keezel & Worden.

THE eighth annual convention of the Michigan Retail Hardware Dealers' Association met this week at the Hotel Cadillac, Detroit. More than 50 members were in attendance. There were also a number of delegates from the National and various State associations, as well as representatives of manufacturers and jobbers.

INSURANCE AS RELATED TO THE ACETYLENE GENERATOR MANUFACTURER.

BY L. J. WING, NEW YORK.

Your committee selected me to take up the fight with the greatest Goliath the acetylene interest has to combat with. Well, I obeyed orders and took up the investigation. I first wrote to a friend of mine, the president of one of the large insurance companies (who, by the way, at my request, had helped to do away with the numerous boards of examiners and their charges from \$50 to \$75 that we formerly had to deal with and now is condensed with the National Board, with offices in this city), and stated what I had been asked to do and that I would appreciate any information he could give me. I received a courteous answer, in which he stated that W. R. Merrill, Jr., secretary of the Underwriters' Laboratories, Chicago, was thoroughly informed on the subject and he would recommend me to see him and he would give me the information as to present requirements. I have had a long interview with Mr. Merrill since my arrival. He claims that the insurance companies are not opposed to the acetylene generators and that the rules and regulations are in the same lines as for electricity and are for the protection and benefit of the manufacturers and users as well as for the insurance. He says they (the engineers) are glad to get points and suggestions from manufacturers for changes and improvements in the rules and regulations. He gave me a number of their latest booklets and asked me to distribute them and confer over the rules, &c., and if we would suggest any changes that would help the case they would like it much. He claims that electrical architects and manufacturers of other lines assist them in their various lines. He suggested that this association appoint a committee of its members for the purpose of assisting them to get a more perfect set of rules and regulations.

I think that so far as Mr. Merrill himself is concerned he will do what he can to help the acetylene interest. How much authority or power he has I do not know, but from information given me by our worthy president it seems that the insurance authorities had got out the rules, &c., with the words "acetylene gas machines must be installed outside of building insured," and that it took a good deal of work to get "must" changed to "should." This being the case it looks very much as if the antagonistic financial interests had a strong hold on the said insurance authorities, and whether this influence will be strong enough to make us more trouble in the near future is something for us to consider.

ACETYLENE INTERESTS WANT FAIR TREATMENT.

It seems to me that acetylene interests have not received that fair and reasonable treatment they are entitled to by the insurance and city authorities. It is to be hoped that hereafter the manufacturers who have their money invested in acetylene and the people who wish to use acetylene will receive more liberal, just and reasonable treatment from the insurance companies and from city authorities. Having a good deal of money invested in acetylene I have naturally watched all sides very carefully, and particularly the question of insurance and accidents. We are told by insurance and city authorities, and by those whose financial interests are opposed to it, that it is dangerous both as to fire and accidents to life and property. Acetylene has come into quite general use and is daily growing more general. Do the facts bear out the statements made by the parties named? No; most emphatically no; not in either case. How many fires have been caused by the use of generators, as made within the last three years? How much property burned? How many people have been hurt from the use of these generators? A very small amount of property has been burned. A very few, indeed, have been injured. Mind you, the explosions in experimental work on liquid acetylene is not chargeable to or a part of this business.

Let us take up some of the other lights used by the people and almost without question of the insurance and city authorities—oil lamps. Is there a day passes that there is not a fire or an accident in the United States from the use of oil lamps? Do the insurance and city authorities forbid their use inside of buildings? No. Why? How many fires; how much property burned and how many lives are lost by the use of electricity each year? I am informed, by what is considered good authority, that over 40 per cent. of the total loss of fire in the United States is caused by electricity. The insurance companies and city authorities have rules and regulations for electric lighting, &c., but do they forbid it inside of buildings? No. Why?

COMPARATIVE SAFETY OF ACETYLENE.

I once argued the matter before some authorities and brought up these points, and asked why, but got no satis-

factory answer. I finally asked, can it be possible that antagonistic financial interests are behind the unreasonable treatment acetylene received? I hope not, but it looked like what the darkey called "spicious." In New York and some other cities they will allow only 100 pounds of carbide in any building unless in fireproof, isolated buildings and then only 500 pounds. Yet any one can keep barrel upon barrel of alcohol, turpentine, oils, &c. Which is the most dangerous, carbide in iron cans, or oil, turpentine, &c., in wood barrels? I had a conversation with a party who had 18 cans of carbide in the basement of a building that was burned in the city of Washington, D. C. He told me that the building collapsed and that the brick and water were several feet above the carbide and that only one can leaked and that one made no trouble beyond the loss of the carbide. In the great fire at Paterson, N. J., last March, we had a 100-light generator in H. Munger's liquor store. He told me personally that he and others stood in the street watching the fire; it was in the night and a few burners were lit; he said he would hear barrel after barrel of whisky explode but still the lights burned on, although the whisky barrels were within 20 feet of the generator; finally the walls fell on the generator and the lights went out, but no explosion. A few days later I went out and examined the generator. I found that the brick in falling had smashed in the top of the generator and the bell of the gas meter and the fire had burned what gas there was in it and then went out. No explosion. This was proven from the fact that the generator was good enough to repair, which we did, and Mr. Munger is now using the same generator to light his new building. The *Acetylene Journal* of March had a report on this case and stated that it was a Colt generator. I have not seen any correction from Colt's or the *Journal*. I have built generators for some three years and have quite a number in use. There has not been a fire or accident caused by one, so far as I know. I had a friend badly hurt by an oil lamp some ten years ago; since then I have not had one in my house. I am perfectly willing to have any good acetylene generator in my home, whether for ten lights or for 500 lights.

In conclusion, I believe the insurance and city authorities should make rigid rules and regulations for the manufacturing and use of acetylene generators similar to those in use for electricity and then allow their use, the same as electricity is permitted. Examinations by inspectors would also be a good feature and a safeguard. "Tin can" generators should be forbidden.

I would go a little further and say that this association should place itself fairly and squarely on the side of trying to make the business a safe and reputable business, both as to the class of generators, stove burners, and as to the system of doing business, each and every member doing his best to place the business on a safe, sure and profitable basis.

A Vacuum Heating System.

A notable installation of the vacuum system of heating is being made in the new building which the Chicago *Tribune* is erecting in that city. The building is equipped with an elaborate system of air washing, drying and cooling apparatus for both summer and winter use, the heating taking the place of the cooling system in the winter. The plant is being installed by the L. H. Prentice Company of Chicago. It includes 35,000 square feet of radiating surface and there are more than 5 miles of steam piping in the building, which is 21 stories high. Especial care has been taken in running this piping to avoid air locks or water hammer, or any of the other annoying features of a steam heating plant. The radiation is arranged in several sections, the ventilating system being on one section and the heating system for the *Tribune* offices on another section, while the building proper is on still another section, which is piped on the overhead plan. All of the systems, however, are equipped with the vacuum apparatus to remove the air from the mains and the radiators so as to insure not only a quick distribution of the steam, but also an economical heating of the building through low temperatures suited to the weather. This is attainable with the vacuum system of heating, which will circulate a vapor at temperatures much below that of steam under pressure.

THE COLWELL LEAD COMPANY baseball team desire games with any team in the plumbing supply trade in Greater New York. The captain of the team is P. A. Fraser, and any communications addressed to him at 63 Centre street, New York, will have prompt attention.

DEATH OF JOSEPH BOND.

Joseph Bond, president of the American Radiator Company, died August 8 at the family residence, Chicago. In his death Chicago loses one of her prominent business men and useful citizens. Mr. Bond was born at Ware, Mass., February 12, 1852. He was a descendant of one of the oldest families of the Bay State, and the Bond homestead, built about a decade after the landing of the Pilgrim Fathers, still stands at Ipswich, being one of the historical landmarks of the State. Joseph Bond was educated in the public schools, and at the Kimball Union Academy at Meriden, N. H. At the age of eighteen he entered business life. From 1875 until 1880 he was engaged in the hardware trade on his own account at Waltham, Mass. He removed to Buffalo a year later and entered into partnership with J. B. Pierce under the name of the Pierce Steam Heating Company, manufacturing heating appliances. The firm were among the pioneers in this line of industry. He was soon made treasurer of the concern, and that position he held until 1892, when he went to Chicago to assume executive control of the then newly organized American Radiator Company.

The growth and prosperity of this concern are largely due to Mr. Bond's tireless industry, his thorough knowledge of the technical side of the business and his unusual organizing ability. Under his direction as president and chairman of the Executive Committee the company steadily extended their operations and scope, growing to be the largest of their kind in the world, employing 3500 men, and having factories and branches in several cities in the United States and in England, Germany and France. Mr. Bond made a science and an art of his work, exhaustively studying the principles of manufacturing steam and hot water heating materials, and introducing new methods into that special industry. He was recognized as an expert or master in his field of activity.

He was prevented by his close application to business from taking that part in public affairs for which his intelligence and integrity conspicuously fitted him, but he was a keen observer and an interested student of political, economic and social questions. In politics he was a Republican, but he never identified himself with any particular local organization. He was a trustee of the Chicago University and took a deep interest in its progress. He was also a member of the Chicago, Union League, Quadrangle and Ontwentsia clubs, but had little time for club life.

For religion and church affairs he always found time. He was a devout Christian and for years he was a leading spirit in the Immanuel Baptist Church. He became interested in the Bible class of this church and took great pleasure in guiding the young men in that class,

supplementing precept by example and conforming deed to word. He aided many young men in securing suitable employment and in educating themselves for their vocations or pursuits. In a quiet, unostentatious way he thus helped many a young man to help himself, and enabled not a few to continue their special studies at home and abroad. Strict, punctual and methodical himself, he was tolerant, considerate and charitable to others, always kindly and generous, ever full of encouragement and faith in the better part of human nature. He was a Christian gentleman and a Christian business man. Mr. Bond commanded the respect and loyalty of all his business associates, and his employees always found him just, reasonable and sympathetic.

The malady to which Mr. Bond finally succumbed, Bright's disease, first manifested itself nearly twenty years ago. At that time his physicians despaired of his

recovery, but his careful habits and temperance in all things (save work, in which he was intense and strenuous) preserved him and gave him a longer lease of life. His last illness was of three months' duration.

Mr. Bond leaves a widow and two daughters, Mrs. Edgar Goodspeed, wife of Dr. Goodspeed of the University of Chicago, and Miss Louise P. Bond. A brief memorial service was held at the Immanuel Baptist Church, Chicago, on Sunday morning, August 10, and the remains were taken to Buffalo, N. Y., in a special car accompanied by the family. Another special car followed containing prominent officials and employees of the American Radiator Company, among them being the following: C. M. Woolley, Charles K. Foster, W. H. Hill, S. K. Pittman, E. T. Fish-

JOSEPH BOND.

wick, J. D. Erskine, Clarence Carpenter, Eugene Davis, E. G. Ingersoll, W. H. Heffern, B. F. Stall, W. E. Oliver, Louis Bruch, F. R. Mason, S. L. Hopper, J. A. Sheahan, Julia Colohan, Jennie L. Richmond, Alice E. White, W. E. Strong, E. A. Sumner, Jr., H. I. Lord, E. A. May, Richard Matthews.

Funeral services were held on Monday afternoon, August 11, at the Delaware Avenue Baptist Church, Buffalo, conducted by the Rev. O. P. Gifford, pastor of the church, assisted by the Rev. George Whitman of the Lafayette Avenue Baptist Church. The active pallbearers, all from the Chicago office of the company, were Louis Bruch, Charles K. Foster, S. K. Pittman, Edward J. Fishwick, William H. Hill and James D. Erskine.

Among those present at the funeral were A. A. Landon, assistant manager of the Pierce plant, Buffalo; Frank B. Howell, manager of the Bond plant, Buffalo; Frank Le Clerq, manager of the Standard plant, Buffalo; William D. Shockley, manager Detroit plant; Clarence Carpenter, manager Michigan plant, Detroit; A. A. Aiken, manager Titusville plant; S. De Long, manager Steel plant, Springfield, Ohio; Charles C. D. Gott, manager New York branch; Frank J. Bassett, Jr., manager

Boston branch; Frank A. Brastow, manager Philadelphia branch; Edward Stoughton, manager Buffalo branch. Also most of the directors, including Clarence M. Woolley of Chicago, E. A. Sumner of Detroit, Clarence Carpenter and W. S. Russel of Detroit, George W. Parker of St. Louis, Frank O. Lowden of Chicago, Frank M. Peters, general counsel of the company, and many of the dead man's business associates and friends from Boston, New York, Philadelphia and all the prominent business centers of the country. Cablegrams of regret from foreign branches in London, Hamburg and Paris were received. The remains were interred in the Forest Lawn Cemetery, Buffalo.

The honorary pallbearers at Chicago were Dr. William R. Harper, J. B. Murphy, O. S. Lyford, Dr. Thomas W. Goodspeed, Prof. Shailer Matthews, J. R. Chapman, Clarence Carpenter and William Hansbrough, and the honorary pallbearers at Buffalo were F. M. Peters, Ellis Webster, Hon. William A. Marcy, Dr. Dewitt G. Wilcox, Walter S. Russel, E. A. Sumner, Hon. John Fertig and Clarence Carpenter.

TRADE RESOLUTIONS ON DEATH OF MR. BOND.

At a special meeting of the manufacturers of boilers and radiators represented in Chicago, held August 9, 1902, the following preamble and resolutions were unanimously adopted:

Whereas, It has pleased the Almighty in His profound wisdom to remove from our midst our respected and greatly esteemed friend and business associate, Joseph Bond, president of the American Radiator Company; therefore be it

Resolved, That we express our heartfelt and profound regret at the loss in the prime of life of a gentleman so worthy of the highest honor in the commercial community, so truly beloved by his friends, tenderly attached to his family, and who for many years, by his strict probity and untiring energy, has contributed so largely to the growth and prosperity of our city.

Resolved, That we hereby extend our condolence to the officers and Board of Directors of the American Radiator Company in the loss of their faithful, worthy and beloved president; and be it further

Resolved, That we tender to the family and friends of the deceased our sincere sympathy, trusting that in their hour of trial they may be comforted by the presence and sustained by the hand of "Him Who doeth all things well."

Resolved, That an engrossed copy of this memorial be presented to the family of the deceased as a mark of our respect.

International Sanitary Congress.

The International Sanitary Congress, which was to have been held in Washington during the week of October 15, has been postponed until the week of December 2. The postponement was made upon the suggestion of Surgeon-General Wyman of the Marine Hospital Service, in order to allow the delegates to the conference to attend the meeting of the American Public Health Association, to be opened in New Orleans on December 8. The object of the convention is to encourage friendly co-operation between the health organizations of the several nations represented, in the matter of quarantine and sanitation.

The headquarters of the congress and all the meetings will be held at the New Willard Hotel. In addition to the treatment of sanitary quarantine laws there will be discussions in reference to special sanitary work now in progress and proposed, the sanitary improvement of harbors, soil drainage and the sanitation of dwellings.

A New Supply Plant.

The John Davis Company, manufacturers of steam fitters' and plumbers' supplies and dealers in wrought iron pipe, now at 51-79 Michigan street, Chicago, have in course of construction on what is known as the Dupont property at Union, Twenty-second and South Halsted streets, two new buildings which are to be ready for occupancy November 1. The buildings are to be a machine shop and warehouse, built of brick, the warehouse having four stories and basement and the machine shop being a one-story structure with gallery. The

warehouse is to be used solely for storage purposes, with the exception of a part of the second floor, where the business offices of the company are to be located. It is expected that the working force will number between 500 and 600 men, and that the capacity will be double that of the present time. Switch tracks connecting both buildings with the main line of the Chicago, Burlington & Quincy Railway permit of the best possible shipping facilities. The lighting and operating power is to be furnished by electricity, and electric elevators will be run in the warehouse. The erection in the near future of a foundry, storage houses and pipe sheds, in addition to the warehouse and machine shop, is contemplated, and it is estimated that the entire plant when completed will cost \$200,000.

RADIATORS.

It was no surprise to the trade that notices should be sent out announcing an advance in the price of radiation. The only surprise was that the advance did not come with the advance in the price of boilers on August 9 instead of being dated the 12th, or a few days later. The advance is 5 per cent., a like amount to the advance in boilers. That there was a strong feeling in favor of a greater advance and that the agreement was finally reached to cut in half the figure advocated by some is by this time an open secret throughout the trade. The new prices have been received with practically no adverse comment, as a larger advance was generally looked for.

The heavy buying of radiation in July indicated anticipation of the advance, and there is a feeling in the trade that the top has not yet been reached. In view of the prevailing cost conditions this feeling has substantial basis, and it will not be surprising if the buying in August should show further anticipation of a further upward movement in prices of both boilers and radiators. Notwithstanding this outlook the trade in some sections complain that the prices made for heating systems are too low and do not show the profits that are necessary when all of the expenses of carrying on a business are carefully considered. Complaint is also made that work costs more, owing to the fact that the workmen do less in a day than heretofore, so that, with shorter hours and increased wages, the heating contractor needs to revise the basis of his estimates for time, or loss will overtake him.

Although the rush season has not yet made its influence felt, the indications, as far as can be seen at present, favor a general stiffening of prices in the steam and hot water heating trade, both wholesale and retail.

Lawler's Steam, Water and Gas Specialties.

A 68-page publication, just received from the Lawler Water Feed & Damper Regulator Company, 181 Mercer street, New York, is devoted to a variety of devices of interest to the trade who install steam, water and gas systems. The catalogue opens with a variety of steam traps, including a return steam trap designed to return the water of condensation from heating systems to the steam boiler without the use of a pump. Temperature regulators, blow off catch basins and condensing tanks, various styles of automatic water feeders for boilers, hot water damper regulators and a thermostatic regulator for indirect radiation are then illustrated and described, and water heaters for heating the water in storage tanks for apartment houses and hotels, using either steam or gas, are also shown. Expansion tanks, cellar drainers and check drafts are another variety of devices adapted to the use of the plumber and steam fitter, which are included in the catalogue. A variety of high power gas burners are also shown, designed to secure a large heating capacity and capable of indefinite extension.

Another section of the catalogue is devoted to malleable iron fittings for the use of plumbers, including straddle fittings, cross ovens, air chambers, wash tray tees and elbows and boiler union tees. Another specialty is a return circuit check valve for domestic hot water supply systems. An adjustable boiler stand and a special plumb bob for gas fitting will be of interest to the trade. The catalogue is completed by several pages of useful tables and memoranda.

The International Acetylene Association.

ANNUAL MEETING.

The annual meeting of the International Acetylene Association was opened in the assembly room of the John Crerar Library, Chicago, on Monday morning, August 11, at 10 o'clock, with President George Landis Wilson in the chair. The meeting having been called to order the president read his annual address, as follows:

President's Address.

Since the successful meeting at Buffalo there has seemed to be very little that this association could do. There have been a number of new members added, and our old membership has kept up the moderate dues necessary to pay the working expenses of the association, so that we now have no debts and retain a small balance in the treasury.

The developments of the year in the acetylene industry have been marked in several directions. Most noticeable, in a general way, as influencing the business as a whole have been the extensive applications of acetylene to special uses. Car lighting has received particular attention, and much money has been invested in the development of this branch of this industry by a number of companies working independently upon many railroads to such good effect that acetylene to-day is recognized by the most progressive managers as the ideal light for railway coaches, although there is no unanimity of opinion as to the best means of applying it for this purpose. The several devices cover the entire field, commencing with compression of pure acetylene to the point of liquefaction.

Different experimenters have tested the merits of plain moderate compression; compression combined with various solvents; compression mixed with dilutents, independent sprinkler generators inside the car and also under the car; carbide feed generators inside, outside and through the car. Some have been very successful and some quite unsuccessful, but whatever the degree of technical success, all observers have agreed that the acetylene light meets every requirement, and among the traveling public it makes friends for acetylene to the benefit of all associated with the industry. Searchlights, headlights and stereopticons supplied with acetylene are no longer curiosities, but have become articles of regular merchandise.

Perhaps the most marked progress of the year has been in the installation of large plants for acetylene lighting in places which have until this year struggled under the handicap of irregular and ineffective illumination. In competition with acetylene the very small electric plant appears to be doomed, excepting in instances where some abnormal conditions make it practicable.

Marketing conditions have been slightly improved by the elimination of some of the smaller manufacturers who have not found in the business any large profits. Interests closely identified with the manufacture of carbide have taken up the sale of generators and supplies; the effect of this competition upon the industry as a whole is difficult to foretell, but I question whether it is advantageous.

One handicap under which all acetylene generator builders must labor for some time is the dearth of mechanics competent to install generators, instruct users and overhaul installations. This is a big country, and it is impossible for any one concern to have direct representatives everywhere. Neglect, carelessness, ignorance and indifference on the part of users are serious matters for any automatic apparatus to overcome. Clocks and watches have been articles of almost world wide use for several generations; dirt and maltreatment will cause them to stop; trifling attention from a man who "knows all" will put them right again. So it is in time with acetylene generators of any design, and I therefore recommend that this association compile and keep up a list of mechanics competent to attend to such work for generator owners, to which members of the association only should have access. Such mechanics need not be acetylene engineers; few clock tinkers are horological experts.

The insurance question will not down. This year has seen an attempt to burden the acetylene industry with more onerous and unwarranted regulations. Some of our members are of the opinion that the surest, simplest and most direct way to meet this difficulty is the organization of an insurance company who are entitled to confidence, composed of men who know that acetylene is the safest, as well as the best illuminant, ready to write acetylene risks on their merits at schedule rates, without penalties, unhampered by board rules. It is

also suggested that one or two Lloyds' might be organized for the same purpose. Such underwriters have ready at hand a large body of agents in direct touch with the insured, and should be able to do a successful and profitable business, because users of acetylene are, as a rule, among the most responsible and progressive people in any community. I recommend that at this meeting steps be taken for the inauguration of such plans.

This association should be more to its members than it has ever been in the past, and should command the active support of every fair minded man in the industry, as it has never undertaken to hamper or pledge any of its members, but has confined its efforts to the advancement of the business as a whole without fear or favor. Let us move forward with a determination to follow this road to the end, be it indistinct and rough, or broad and easy.

The address was closely followed by those present, and was liberally applauded at its conclusion.

The report of the secretary and treasurer was then presented by J. B. Carroll.

Secretary and Treasurer's Report.

While the past year has not been a particularly active one with the association, there has, nevertheless, been an increase in the membership, and the affairs of the association at the present time are in a healthy condition. The third annual bulletin issued by the association has attracted considerable attention, being read with interest by a large number of persons interested in acetylene.

The acetylene industry is without doubt still in its infancy, in spite of the recent rapid development, and the indications are that its future growth will be phenomenal; in fact, it is freely predicted by generator manufacturers that the trade this fall will far exceed that of any like period in the history of acetylene. I have had the pleasure of talking with generator, burner and fixture manufacturers in different sections of the United States, and find them universally optimistic regarding the future of acetylene.

I take pleasure in calling your attention to the greatly improved appearance of the official organ of this association, and believe that you will agree with me that its prosperous appearance is in itself conclusive evidence as to the present satisfactory condition of the acetylene industry.

I take pleasure in submitting the attached financial statement, which I trust will be satisfactory to you:

Cash on hand.....	\$173.07
Dues receivable.....	180.00

Total assets.....	\$353.07
-------------------	----------

President Wilson announced the unavoidable absence of E. P. Caldwell, general manager of the Railroad Gas Lighting Company, Chicago, who had prepared a paper, entitled "Car Lighting from Independent Acetylene Generators," which was read by the secretary.

The discussion on this paper was postponed to a later session, and on motion the convention adjourned, to meet again at 2 o'clock.

MONDAY AFTERNOON.

When President Wilson called the convention to order it was evident that an interesting session was assured, as the attendance was largely increased, the room being comfortably filled. Members from distant points were present, and as the meeting progressed local members and others interested in the work of the association made their appearance.

President Wilson introduced A. E. Schlieder of Omaha, Neb., who read a paper, entitled "Acetylene Possibilities at the Louisiana Purchase Exposition," which is presented in another column.

Immediately following the reading of this paper the Committee on Transportation made their report, in which they outlined the work done during the year, which resulted in the following: Calcium carbide is now carried throughout the United States as third-class in less than car lots, and as fifth class in car lots. Generators, as a rule, are classed as double first, in less than car lots, and as fifth in car lots. A generator requiring a flat or gondola car takes the first class, with a minimum weight of 5000 pounds. The committee refer at length to the matter of shipping carbide in steam vessels carrying passengers, which, according to a decision of the Treasury Department made June 18, 1898, is prohibitory. The committee urged the necessity of action

upon the part of the association to remedy this matter, and suggested that a permanent committee be appointed to take this matter in hand during the coming year.

Following this report, Elias A. Long of Chicago read an interesting paper, entitled "Foreign Acetylene Associations and Their Work." Mr. Long had evidently given his paper much time and thought, as it gave evidence of careful preparation. A surprising feature of the paper was the statement that foreign associations devoted to the acetylene industry were numerically considerably stronger than associations in this country, one German association referred to having several hundred members.

W. W. Turner of Chicago read a paper, entitled "Town Lighting by Automatic Generators," which was listened to with much attention. The question of town lighting is one which is agitating the acetylene fraternity throughout the entire country, and any new points on the subject are eagerly sought after.

The Legal Committee presented their report, which showed that while there are hundreds of patents covering the manufacture of acetylene generators, yet during the past year no suits have been brought for infringement of these various patents. With acetylene burner patents a different condition exists. The infringement cases of Kirchberg Schwartz *et al.* vs. the American Acetylene Burner Company, and the American Acetylene Burner Company vs. Kirchberg, Schwartz *et al.*, have been prosecuted diligently during the year, and are so far advanced that both actions will be tried this year, and at the same sitting of the court.

The results of these cases is naturally awaited with much interest by the burner manufacturers, as well as the trade in general.

The president then appointed the following as Committee on Resolutions: L. J. Wing, New York; C. E. Ummach, Chicago, and R. B. Steward, Chattanooga. In appointing the Committee on Resolution President Wilson referred to the desirability of having on file with the secretary a full and complete list of expert mechanics making the repairing of acetylene apparatus a specialty, and urged the Committee on Resolutions to cover this feature in their recommendations.

The report on burners was presented by H. E. Shaffer of Buffalo, N. Y., and after being read was referred back to the committee, with the request that the report, in addition to covering the matter of burners, also take up the question of piping, as this was considered of as much importance in the operation of an acetylene plant as the burners. The report on burners was very fully discussed, and when the discussion closed the convention adjourned to meet Tuesday morning at 10 o'clock.

TUESDAY MORNING.

On opening the meeting C. E. Ummach, Chicago, Ill., was presented to the association, and read an interesting paper, entitled "Acetylene Wrinkles." The election of new members followed the reading of this paper. Those elected were as follows:

Chas. W. Iden, Iden & Co., New York City.
W. L. Barth, American Acetylene Lighting Company, Limited, Battle Creek, Mich.
W. K. Wellman, secretary National Stove & Illuminating Company, Cleveland, Ohio.
P. W. Shute, Ypsilanti, Mich.
Geo. F. Owen, Grand Rapids, Mich.
C. L. Williams, Chicago, Ill.

The president announced that the annual dinner would take place Tuesday evening at 6.30 o'clock.

Question Box.

The Question Box was then opened and placed in charge of Geo. F. Owen of Grand Rapids, Mich. This proved one of the interesting features of the meeting. The questions discussed were: "Purification and Its Real Value," "Meters and Their Use to Promote Business" and "Special Applications of Acetylene."

L. J. Wing of New York City then read a paper, entitled "Insurance As Related to the Acetylene Generator Manufacturer," which is presented elsewhere in this issue. A spirited discussion followed the reading of this paper, which finally resulted in the adoption of the following resolution:

Whereas, The policy of the insurance companies has hampered the acetylene industry; therefore, be it

Resolved, That the International Acetylene Association appoint a committee of three or more to consult upon the organization of a combination of insurance companies to insure acetylene risks, or, if necessary, to organize an Acetylene Insurance company or Lloyds, and the members of the International Acetylene Association pledges its support to the underwriters, which may be organized in accordance with this resolution.

This resolution was adopted with much *eclat*. At 4 p.m. the convention adjourned, to meet Wednesday morning at 10 o'clock.

Beefsteak Supper.

Over 30 members and others sat down to a well served supper at the Leland Hotel at 6.30 on Tuesday evening. After cigars and coffee had been served, a number of impromptu talks were made, and from the general tenor of the remarks it was very evident that a bright future is in store for the International Acetylene Association. The party broke up at 9 o'clock, well pleased with the evening's entertainment.

Following is a list of those present:

W. W. Turner, Abner Acetylene Company, Chicago.
Chas. E. Ummach, R. Williamson & Co., Chicago.
Edw. C. Lovett, Wm. H. Crane Company, New York.
George R. Wilson, Domestic Engineering, Chicago.
Paul J. Kruese, Sunlight Lava Mfg. Company, Chattanooga, Tenn.
F. P. Keeney, Domestic Engineering, Chicago.
H. H. Southworth, Plumbers' Trade Journal, Chicago.
Augustine Davis, Davis Acetylene Company, Elkhart, Ind.
C. T. Kuchler, Roessler & Hasslacher Chemical Company, New York.
P. W. Shute, Ypsilanti, Mich.
W. L. Barth, American Acetylene Lighting Company, Limited, Battle Creek, Mich.
W. K. Wellman, National Stove & Ilg. Company, Cleveland, Ohio.
W. C. Heimbeucher, Abner Acetylene Gas Company, Chicago.
H. H. Roberts, The Metal Worker, Chicago.
Chauncey L. Williams, Engineering Review, Chicago.
H. E. Schaffer, American Acetylene Burner Company, Hoosick Falls, N. Y.
A. E. Schlieder, Monarch Acetylene Gas Company, Omaha, Neb.
Frank Price, Davis Acetylene Company, Chicago.
Elias A. Long, Acetylene Journal Company, Chicago.
W. R. Burling, New York World, New York.
Geo. Landis Wilson, F. C. Wilson & Co., Chicago.
Geo. F. Owen, Grand Rapids, Mich.
J. B. Carroll, Chicago.

WEDNESDAY MORNING.

The convention was called to order promptly at 10 o'clock. President Wilson announced that the first order of business would be the election of officers. Judges and tellers were appointed and the following were duly elected:

President, George Landis Wilson of F. Cortez Wilson & Co., Chicago.

Vice-President, L. J. Wing of L. J. Wing & Co., New York.

Secretary and Treasurer, J. B. Carroll, Chicago.

The following directors were elected:

H. E. Schaffer of American Acetylene Burner Company, Hoosick Falls, N. Y.

O. E. Schlieder of Monarch Acetylene Generator Company, Omaha, Neb.

R. B. Steward of State Line Mfg. Company, Chattanooga, Tenn.

W. L. Barth of American Acetylene Gas Light Company, Battle Creek, Mich.

Committees.

The following committees were then appointed:

Trade Committee: L. J. Wing, New York; W. W. Turner, Chicago; Geo. F. Owen, Grand Rapids, Mich.; O. E. Schlieder, Omaha, Neb., and P. W. Shute, Battle Creek, Mich.

Committee on By-Laws: Chas. E. Ummach, Chicago; W. L. Barth, Battle Creek, Mich., and W. C. Heimbeucher, Chicago.

Committee on Display at Louisiana Purchase Exposition: W. C. Heimbeucher, Chicago; R. B. Steward, Chattanooga, Tenn., and Augustine Davis, Elkhart, Ind.

Resolutions of thanks to the John Crerar Library for the use of the Assembly Hall for the meetings were duly passed, and also a vote of thanks to the trade press, after which the convention adjourned. The place of next meeting will be selected by the Executive Committee.

The Allen Automatic Air Valve.

In the accompanying illustrations sectional views are presented of the Allen automatic air valve, made by the Norwall Mfg. Company, 42 Dearborn street, Chicago. This valve is made entirely of metal, without expansion post, ring or spring. A simple shell with the radiator connection is so placed as to form a well in the lower part of the valve, to receive and retain the water condensed from the steam as it passes into or through the valve. A sealed metal float is placed in this well.

Surrounding the inner well or chamber is an outer chamber, which is connected with the inner chamber by means of a small hole near the bottom of the inner shell. During the first operation the air in the chamber passes freely through the valve, which is open, as shown in Fig. 1. When steam enters the valve it condenses, gradually filling the inner well with water, carrying the sealed metal float to its seat, thus closing the valve, as shown in Fig. 2. When steam enters the valve in the first operation it takes a few minutes to condense sufficient water to close the valve. During the first operation the air in the outer chamber is expanded by the heat of the steam, and a portion of it is expelled through the small hole into the inner chamber, thence out of the valve through the regular outlet. As the inner chamber fills with water from condensation the outlet from the outer chamber becomes sealed by the water. As the valve cools when steam goes off the air in the outer chamber contracts and draws the water from the inner chamber, allowing the float to drop, thus opening the valve. When steam again enters the valve the heat almost instantly expands the air in the outer chamber, forcing the water into the inner chamber, carrying the float to its seat and closing the valve.

The operation is always the same, whether the pressure is 1 pound or 10 pounds. The greater the pressure

of shape. The expansive force is simply air. The valve freely vents the air from the radiator, closing rapidly against steam and water automatically.

A Workshop Washstand Design.

We reproduce from *Cassier's Magazine* the illustration of a workshop washstand design which is on exhibition in the Museum of Security, Amsterdam, Hol-

A Workshop Washstand Design.

Fig. 2.—Valve Closed.

The Allen Automatic Air Valve.

the higher the temperature, but the only effect this condition has on the valve is simply to expel a little more of the air from the outer chamber of the valve. When the valve cools, as there can be only a given amount of water in the inner chamber, up the level of the outlet into the radiator, the contraction of the air in the outer chamber draws the water from the inner chamber and then draws air through the water until the chamber is fully recharged. When cold the condition of the valve is always the same. No adjustment is necessary at any time, as there is no expansion post to buckle or get out

land. This society, and the French and Italian associations of employers for the prevention of accidents, exhibit many devices designed to avoid danger and prevent suffering. The washstand shown is evidence of the opinion that sanitary precaution is beneficial, as an individual tap and bowl reduces the danger of contamination which may result from a number of persons washing in one large tub or trough. With the tilting bowls, cleanliness may be secured by each person who uses the washstand. The general design is adapted to a cement floor, to drain readily and to facilitate scrubbing. It occupies little space, and affords each user ample room for ablution.

The Tobey Water Heater.

The frequency with which the demand to supply an immense quantity of hot water is made upon the heating contractor, will secure attention for the little pamphlet issued by the J. L. Mott Iron Works, 84-90 Beekman street, New York City, describing the Tobey automatic water heaters and the steam traps used in connection with them. These heaters consist of an outer shell of different diameters and lengths, according to the capacity, in which there are a number of copper heating pipes. These pipes are so arranged that a flow of steam enters them and heats the water which surrounds them. The condensation from the tubes passes off through the Tobey trap, which is especially designed for the purpose. A cylinder of the same length, but of smaller diameter, is supported immediately above the water heater, and the hot water passes off through it. This upper cylinder contains a perforated copper tube attached to a thermostatic valve, so that as soon as the water has reached a certain desired temperature to which the heater has been adjusted, the steam is shut off, operating automatically, opening and closing as necessity requires. This device has been found useful for supplying apartment houses, hospitals and infirmaries, where a large quantity of water for bathing or

other purposes is required at a given temperature, furnished by an apparatus which prevents any possibility of overheating and scalding. It is made in capacities for heating from 1000 to 10,000 gallons per hour, and has been used in a number of instances for heating the water for plunge baths and swimming pools in gymnasiums and similar buildings. The concern issue a special pamphlet devoted to these devices, giving full information and particulars in reference to them, from which the heating contractor can readily determine the size of apparatus that he may need for a given piece of work.

ACETYLENE POSSIBILITIES AT THE LOUISIANA PURCHASE EXPOSITION.*

BY A. E. SCHLIEDER, OMAHA.

About 100 years ago, President Jefferson purchased from the French nation for the people of the United States an immense tract of land now comprising several States of the Union; to commemorate this transaction it has been decided to hold a grand exposition at St. Louis, Mo., in 1904. It is intended that this coming exposition shall eclipse all former efforts in this line, especially it is proposed to make the illumination of the grounds and building the grandest spectacle ever witnessed by human eyes, and no doubt it will well repay any sacrifice necessary to go to the exposition, if only to see the illumination, which we are promised shall be one of its many interesting features.

The acetylene possibilities at this coming exposition are largely dependent upon the amount of practical interest taken and the assistance rendered by the management of the exposition itself, as well as upon the amount of money, energy and intelligently directed effort put into the enterprise by acetylene interests.

ACETYLENE AT THE PAN-AMERICAN.

The magnificent stately building, beautifully, brilliantly, yea, perfectly illuminated with acetylene, in which were displayed practical, comprehensive exhibits of the acetylene industry at the Pan-American Exposition at Buffalo last year, will long remain a bright spot in the memory of all who saw it (excepting possibly our competitors), as well as a lasting monument to the energy and ability of those who conceived and carried to a successful termination that magnificent enterprise, which was truly a revelation to thousands, including not a few who were already somewhat familiar with the illuminating value of acetylene.

The Acetylene Building, the carbide producing furnace, the generating apparatus, the burner and portable lamp displays, were all excellent and creditable for 1901, but the possibilities for 1904 are greater than they were in 1901, and we must surpass the Buffalo acetylene exhibit, or it would seem as if we were not progressing; and here the question arises, How shall this be done?

Among the many suggestions which present themselves are a larger, more imposing acetylene building, with the lights outside and inside multiplied, with more space for individual exhibits. It should be possible to secure enough exhibits to occupy every available foot of space in this building with displays from the different lines in the acetylene industry, not a foot of space should be allowed to remain vacant; a well filled building always creates a more favorable impression than one with vacant spaces, especially when the exhibits are all of the same nature. To secure this result it might be possible to make the price charged for space nominal, as making an exhibit at a large exposition is expensive at the best, and many manufacturers argue that the benefits derived do not justify the outlay necessary to make a creditable exhibit. Exhibits are most interesting and instructive when they are installed as live exhibits—that is, they can be set up so that they can be operated, thus demonstrating in a practical way what may be expected from them when installed on the user's premises.

WORKING EXHIBITS.

Generating apparatus especially should be installed, so that the process of producing acetylene may be illustrated while the theory is being explained. Many persons are slow to grasp the idea from mere explanation, and it has happened that after the operation of a generator and the philosophy of producing acetylene has been minutely explained one of the careful listeners has asked: "Where did you say you put the gas?"

Comprehensive exhibits of portable house lamps, bicycle lamps, buggy lamps, miners' lamps and railroad lanterns, should be made, as all these help to educate

the public to the intrinsic value of acetylene. In my home city the gas company use acetylene lamps to read their meters by, thus even our competitors use acetylene in dark places, where they think no one is looking at them. Railroad companies are constantly experimenting to find suitable apparatus for engine head-lights and coach lighting; a satisfactory exhibit along this line would attract no small amount of interest from railroad men; here is a large field for acetylene endeavor practically untouched.

ACETYLENE COOKING APPARATUS.

Acetylene stove exhibits should demonstrate that acetylene is practical for fuel purposes; many gasoline plants are sold to people who would buy acetylene plants were they not positively informed by the gasoline man that their acetylene range will surely go wrong, explode, demolish everything in sight and retire the cook from future usefulness; surely a dreadful calamity. Our friends, the acetylene range manufacturers, might enter into a partnership with some promoter of a new brand of flour, or a new cereal which they are anxious to demonstrate; and prepare the samples on an acetylene stove; distribute it to the public with a souvenir stating that the bun was baked by acetylene heat. This would have the merit of being popular, as few people will refuse samples of anything that is good to eat.

ACETYLENE LIGHT VS. ELECTRIC LIGHT.

One of the hard things in demonstrating acetylene is to convince the average man that a ½-foot acetylene burner gives as much light as his 16 candle power electric incandescent lamp, and when you tell him that it gives one-third more light than his electric lamp he is apt to intimate that you are taking liberties with his intelligence. It would be possible to arrange an exhibit of acetylene and electric incandescent lights in an otherwise dark room in such a way that the two would light and extinguish alternately each five seconds; arrange the two so that the cost per hour would be the same for one as for the other, in this way we might convince our skeptical friends of the truth of our assertions and of the superiority of acetylene, because there would be a fully developed eclipse in that room every alternative five seconds.

There will be many difficulties on the grounds away from the acetylene building. All the entrances to the grounds might be lighted with acetylene; these lights ought to be fitted with electric spark igniters and arranged so they will spell out the word acetylene, thus appraising every one entering the grounds that acetylene is staring them in the face and is not ashamed of it, either.

Another possibility is an acetylene tower (perhaps not so elaborate as the Pan-American electric tower); this might be located in a prominent place on the grounds and fitted with a large number of acetylene lights, this would show by contrast the difference in color and power of acetylene and electric light. It would also create a favorable impression on occasions when the power plant goes wrong and the electric lights go out of business, leaving the grounds and visitors in darkness.

An ordinary eight or ten room dwelling might be provided in which to entertain our friends; this should be neatly and comfortably furnished and liberally provided with papers and magazines. It should be lighted with acetylene and provided with an acetylene range, so a complete outfit could be shown; this would assist greatly in creating a demand for acetylene in private homes.

THE COLOR EFFECT ON PAINTINGS AT NIGHT.

The Fine Arts Building ought to be illuminated with acetylene, as this light is especially adapted to reveal the "beautiful;" it ought to be employed where the desire is to bring out the skillfully drawn lines, the delicate shades and harmoniously blended colors.

One of the popular ways to demonstrate acetylene is to light up State buildings; would it not be possible to get the privilege to light up a group of such buildings located reasonably close together? The gas could be supplied from a central plant; the surroundings of these buildings might be lighted with acetylene street lamps installed on lamp posts or swung from wirelike electric arc lamps. An exhibit like this would fully illustrate acetylene municipal lighting, a subject which is being earnestly discussed by many of the smaller towns. Here is a practical field which has not been worked very hard as yet.

These are respectfully submitted as a few of the acetylene possibilities at the Louisiana Purchase Exposition; because of the hurry necessary in preparing this paper it is quite likely that the best and most important ones were entirely overlooked and omitted, for there is practically no limit to the possibilities of acetylene in the lighting field, and we predict that this new agency

* Paper read at meeting of International Acetylene Association, Chicago, August 11-13, 1902.

of light will march onward and mount upward (using its competitors as stepping stones), until it stands at the very head and is universally acknowledged the queen of lights, worthy of the world's profoundest respect.

ACETYLENE WRINKLES.*

BY C. E. UMMACH, CHICAGO.

This subject is one that has given the writer of this article more than several deep wrinkles. Scorn has its effect in producing wrinkles, also good nature, and a man with sufficient laughing stock will be and is troubled with wrinkles; mechanics find it necessary to put wrinkles, or, in other words, corrugate metal in order to strengthen such material, and I am no doubt delegated by our worthy president to bring out some wrinkles that will strengthen the working of our association. New ideas are simply formed by an individual thought and seldom can one convince a body of men to agree on any particular subject and invariably each and every one had no trouble in adding suggestions until the idea has grown so large it becomes uncontrollable, and the result is each one continues in the same old rut. My recommendation to the association creates a permanent wrinkle department, and let each member send such information to such department that will be of interest to the trade and at our next convention we will be fully advised of all the good things, and possibly some bad ones, at which time we can more fully appreciate the value of the wrinkle department. As you no doubt are all aware of the fact that I am interested in a supply business, and endeavor to issue catalogues illustrating such goods as the trade requires to complete acetylene installation, and I will be pleased to furnish the wrinkle department with such information as my firm may receive from time to time that will no doubt be very beneficial to all concerned.

A wrinkle department is of great value and no one man can more than edit such wrinkles as are sent in from time to time by the members during the year. I earnestly believe that this new departure in the association will be looked upon with great interest, as other associations that have been in existence for years make it a point to spend several days during their convention time discussing wrinkles, and I for one will co-operate to the fullest extent to make the wrinkle department a valuable bureau of information.

New York City Notes.

The number of men now out of work does not speak well for the present state of the trade. Business in the Bronx is especially dull, the only work there being houses which do not come under the tenement house law. A similar condition prevails in Queens and Brooklyn. All the boroughs show a large amount of work being done in private houses, Brooklyn and Queens being especially noticeable in this respect.

In spite of the number of men out of employment it is hard to get enough men to work on the large buildings using heavy screw pipe. The average Harlem plumber doesn't seem to want to have anything to do with it.

Maj. W. H. Linson of the Seventy-first Regiment is just finishing the ten-story Hotel Portland, at 127 and 129 West Forty-sixth street; W. H. Spelman & Co. are plumbing the Graves Hotel, at Madison avenue and Twenty-ninth street; James Armstrong is well along with work in the new woman's hotel—the Martha Washington—on Twenty-ninth and Thirtieth streets, between Fourth and Madison avenues, and John A. Smith has the work in a large nine-story apartment house running from Nineteenth to Twentieth streets, near Third avenue.

The Greater New York Association Executive Committee held its regular meeting last Tuesday afternoon at Rockaway Beach, in connection with the Queens Branch. It was one of the largest attended meetings of the season. After adjournment the representatives, numbering about 50, took dinner at the New York Hotel and spent the evening on the beach. Some missed the last train and accepted the hospitality of the Delcassian,

* Paper read before the International Acetylene Association, Chicago, August 11-13, 1902.

Jefferson and some of the other boat clubs to which members belonged.

Among the large buildings now under way are the Stanley, a ten-story apartment house, at 124 and 126 West Forty-seventh street, the work on which is being done by Stroh & Huber, and the Somerset, a 12-story apartment, at 148 and 150 of the same street, where the work is being done by Charles Heusle.

ENAMELED IRON BATHTUBS.

The independent manufacturers of enameled iron bathtubs have for some time been at work upon a plan by which the concerns outside of the leading manufacturers could agree on some method of improving the conditions which have been prevalent up to the present time in this line of business. It seems that the smaller manufacturers of enameled ware have been putting their goods upon the market at prices which were at no time based upon the cost of manufacture. The chief object simply was to market the output of their plants in order to keep themselves clear of an accumulation of goods which were in a more or less state of improvement and development in the manufacture. The leading manufacturers have had no trouble whatever in disposing of their output, as they make the best ware to be had, and have established reputations which stand for good goods and the best there is to be had in the enameled goods line. The independent manufacturers have had to fight this competition and also to establish themselves as reputable makers of good goods, and in order to get their ware upon the market have been compelled to make the prices considerably below those obtaining for the goods made by the larger concerns. It is to remedy these conditions that the enameled ware manufacturers are now getting together. It is reported that a meeting will be called at Pittsburgh, Pa., the latter part of this month, at which it is said that every one of the manufacturers will be in attendance.

This is not the first time that efforts have been made to get the manufacturers of enameled ware together. Prior to the consolidation of the various interests which now constitute the leading manufacturing concerns in this business, such an association was, for several years in existence, with the result that prices then ruling for enameled ware were almost double what they now are for similar goods. There is reason to believe that the proposed organization will meet with success, as very few, if any, of the independent manufacturers have made any profits. They have, in several instances, got a good insight into the business, and it is no longer a mystery to the trade. There is no reason why, if the business is conducted on legitimate lines, it cannot be made profitable to the smaller, as well as the larger manufacturer.

Heating and Plumbing Notes.

THE Mayor of Niagara Falls, N. Y., has ordered an inventory of the buildings in that city that are supplied with water from the street mains, with the object of inflicting a fine of \$25 on all plumbers who have made connections with the street mains without reporting the work to the proper authorities. It is understood that a large quantity of water is being furnished to householders, from which the city derives no revenue.

In the article entitled "The Vacuum System of Heating," printed in *The Metal Worker* of August 9, an error was made in the name of the automatic air valve mentioned. It should have been called the Allen automatic air valve, which device, made by the Norwall Mfg. Company, 42 Dearborn street, Chicago, is illustrated in this issue.

THE Board of Public Works of Jackson, Mich., has ordered suits against the plumbers who persist in ignoring the water ordinance provisions by doing work without having filed bonds, and in turning on water for consumers without permits.

THE L. J. MUELLER FURNACE COMPANY of Milwaukee, Wis., have secured the contract for installing new ventilating and lighting apparatus in the State Capitol, the amount of the contract approximating \$60,000.

THE Board of Public Works of Chattanooga, Tenn., have awarded the contract for heating the First District School Building to T. S. Wilcox, who bid \$3923. Mr. Wilcox will use the Gurney Boilers.

THE HEATING & VENTILATING FOUNDRY COMPANY of Pittsburgh, Pa., have secured a free site near Elm Grove, Wheeling, W. Va., where they intend to erect a large manufacturing plant. The concern will have a capital of \$100,000, \$50,000 of which is to be subscribed by citizens of Wheeling.

A FIRE doing damage to the extent of \$2500 visited the Plumbing Supply warehouse of Hull, Camp & Co. at 81 Centre street, New York, last week. The fire started on the first floor, which was occupied by Thomas Ford & Co. The loss is said to have been covered by insurance.

THE VAN BERGEN COMPANY are installing a new Steam Heater in the Miners' and Mechanics' Bank at Carbondale, Pa.

THE CARLTON HARDWARE COMPANY of Calumet, Mich., have a contract for installing a heating system in the Sacred Heart School in that city.

W. H. HALSEY of Milwaukee, Wis., has prepared a special report for the State Board of Control, stating that the prevailing diphtheria and kindred diseases at the Industrial School at Waukesha is probably due to defects in the plumbing and drainage system of the institution.

THE *Chronicle* of St. Louis, Mo., states that, notwithstanding the journeymen plumbers of the city had their wages advanced from \$3.50 to \$4 per day last spring, they are now intending to demand a further advance of \$1 per day.

J. WILLS of Revere, Mass., is about to move his plumbing business to a new store near the Central Fire Station.

C. C. MERRILL, son of John Calvin Merrill, the pioneer Sewer Pipe manufacturer of the western part of the United States, died in the City of Mexico on July 26. Mr. Merrill was born in Akron, Ohio, in 1849, and about six years ago, in connection with Harry Neal, secured a concession for the Mexican Clay Mfg. Company, of which he was the vice-president at the time of his death. He is survived by his wife and one daughter.

SCHREIBER & REINHARD of Lebanon, Pa., have the contract for installing the steam heating system in the Zion Lutheran Church in that town.

WILLIAM FINEGAN of Sharon Hill, Pa., has moved into a new plumbing shop.

BIDS will be received until September 6 by the Board of Regents of the University of Texas, at Austin, Texas, for the steam heating system in a four-story brick dormitory for girls.

WE have received from Thomas Kelly & Brothers, Congress street and Forty-sixth avenue, Chicago, Ill., a copy of their 1902 catalogue devoted to the Kelly Non-Freezing Goods, including Stop and Waste Cocks, Self Closing Anti-Freezing Hopper Cocks, Water Cushions, the Kelly Siphon Jet Wash Basins, Frost Proof and Automatic Water Closets and Flush Tanks and Rubber Connections for shower bath use.

THOSE who intend lighting factory buildings by means of Gas Arc Lamps will be interested in a little catalogue issued by the Federal Mfg. Company, 162 West Long street, Columbus, Ohio, devoted to their Gas Arc Lamps. It shows several styles of Lamps adapted for both indoor and outdoor use. They are said to be well adapted for lighting churches, halls and large buildings where a light of strong illuminating power is required.

THE WALKER & PRATT MFG. COMPANY, Boston, Mass., are sending out a mailing card suitable for hanging up in a conspicuous place, showing the various types of the Crawford and Walker Boilers. The Walker Boilers are of the vertical sectional return flue type, while the

Crawford Boilers are round in form. The two lines provide apparatus adapted to all the requirements of the heating trade.

WILLIAM HAAS, 57 Grand street, New York, is sending out a circular showing his Improved Pipe Cutter, and giving testimonial letters from a number of contractors who have used the tool with satisfactory results.

THE Supervising Architect, Washington, D. C., will receive bids until September 11 for the heating apparatus for the Post Office at New Brunswick, N. J.

THE COFFIN VALVE COMPANY of Boston, Mass., have been given the contract for 45 Iron Gates, in connection with the Beckley sewer beds.

THE JUDSON A. GOODRICH COMPANY, 105 Beekman street, New York, have been appointed Eastern representatives of the James A. Trane Vacuum Heating Company and the Norwall Mfg. Company of 40 Dearborn street, Chicago. They are prepared to furnish information and the apparatus needed for equipping ordinary low pressure heating systems with the Trane Mercury Seal and the Allen Automatic Air Valve, to enable them to be used as vacuum systems.

CLARENCE V. KELLOGG of the Kellogg-Mackay-Cameron Company, Chicago, Ill., has left all the details of the Boiler and Heating Supply trade behind him to enjoy a few weeks much needed rest at Mt. Clemens, Mich.

THE Supervising Architect, Washington, D. C., will receive bids until September 16 for heating the Post Office at Oakland, Cal.

H. GILBERT HART of the Hart & Crouse Company, Utica, N. Y., was one of the members of the heating trade who attended the funeral services, at Buffalo, N. Y., of Joseph Bond, the late president of the American Radiator Company. Mr. Hart held a high opinion of the business sagacity of Mr. Bond, the tribute of one successful business man to another.

THE CRESCENT BOILER COMPANY, who have just put their sign on the window at 68 Beekman street, New York, are offering the Crescent Steam and Hot Water Heaters to the trade. Steamfitters visiting New York are invited to call and examine the Crescent Boiler.

THE Supervising Architect, Washington, D. C., will receive bids until September 9 for heating and ventilating apparatus for the Post Office and Court House at Elmira, N. Y.

A MEETING of the New York State Association of Master Plumbers, held at the Livingston Hotel, Rochester, N. Y., on August 1, was attended by President Chas. B. Huck of Buffalo, Vice-President B. F. Donohoe, Secretary H. J. Wood of Buffalo, Treasurer A. H. Brown of New York City, Horace F. Westcott and John E. Dugan of Albany, Samuel Morris of Troy, R. H. Walker of Elmira, J. J. O'Donnell of Syracuse, C. A. Campbell of Watertown and William G. Reid of Rochester. The meeting was held for the transaction of the regular business of the association and for the purpose of securing a more strict adherence to the provisions of the Cleveland Resolutions.

THE BOYNTON FURNACE COMPANY, 207 Water street, New York, and 147 Lake street, Chicago, are sending out a 42-page pamphlet, bound in a red cover with a design in color and gold, devoted to the Boynton Steam and Hot Water Heaters. The catalogue shows, by means of transparent, partly assembled and broken views, round and vertical sectional Steam and Hot Water Heaters and Tank Heaters adapted for all classes of buildings, the largest size having a grate 42 inches wide, specially adapted for large work.

THE plumbing trade will be interested in the facilities of E. S. Wheeler & Co. for shipping promptly all kinds of Plumbing Supplies from their plant at New Haven, Conn. In New York, at 12 and 14 Cliff street, they make a fine display. At the present time they are making a drive for the trade on Closet Tanks, both high and low down, well made and well equipped.

KRAUS, KIRN & Co., Akron, Ohio, bid \$3000 and secured the contract for plumbing and heating the new building of the United Charity Association. Their competitors for the work, Engelhart & Eckart, made a donation of \$50 to the building fund.

THE STANDARD STEAM ENGINEERING COMPANY of Lancaster, Pa., have secured contracts for heating the Clay Street School Building.

THE EXETER MACHINE WORKS have been awarded a contract for installing the heating plant at the Hoyt and Alumni Halls, at the Academy, Manchester, N. H.

BIDS will be received until August 20 by John P. McMahon, Clerk of West Hoboken, N. J., for a steam heating system for the Friendship hose fire house.

THE Master Plumbers' Association of Jersey City, N. J., held a meeting on August 7 at Groeschel's Hall, Oakland and Beacon avenues, and completed arrangements for a trolley outing to Wagner's Park in Carlstadt on Saturday, August 23. It will be a family affair. Three chartered cars will leave Exchange place at 2 o'clock in the afternoon for the park, where there will be dancing, prize bowling and athletic games until 6.30 p.m., when dinner will be served.

As we go to press a meeting of the Eastern Trade Golf Association is in session at the Arena, 39 West Thirty-first street, New York, in response to a call of the president, Charles H. Simmons, issued by Secretary H. A. Smith from his office, 1123 Broadway.

A LETTER from Brown & Wales, 69-83 Purchase street, Boston, Mass., informs us that they have just issued a new catalogue of Plumbing Goods which contains some Closet Combinations that will be of interest to the trade. The company have recently enlarged their office and provided better facilities in their salesrooms, including a showroom for their Plumbing Goods, which are nicely displayed. They are now prepared to handle trade in Plumbing and Heating Supplies promptly and invite visits and correspondence.

THE ACETYLENE APPARATUS MFG. COMPANY, 157 Michigan avenue, Chicago, Ill., are sending out a four-page circular printed in two colors calling attention to their facilities for making Acetylene Lighting Apparatus adapted for any purpose, from the portable light for contractors working out-of-doors to the residence apparatus and plants for lighting hotels and grounds and towns. The company employ expert engineers, who are at the service of their customers, and invite investigation of their goods.

THE ABNER ACETYLENE GAS COMPANY, 41 La Salle street, Chicago, are prepared to furnish the most complete literature to those who are interested in the Abner Acetylene Generators for residence lighting, large building lighting, mutual plant lighting and town lighting.

CONTRACTORS who have to work at night in new, unlighted buildings or out of doors will do well to look into the facility with which a bright white light of great illuminating power can be had under any conditions by the use of the Pathfinder Portable Acetylene Apparatus made by Henry Giessel & Co., 215 and 217 Lake street, Chicago.

S. R. BENNETT, Dover, N. J., has the contract for the steam heating and plumbing work at the Mansion House, Dover, which is being remodeled. He will put in a No. 828 Henderson Thermo Steam Heater made by the Prizer-Painter Stove & Heater Company, Reading, Pa., and 26 additional Radiators, and rearrange the old heating system.

J. C. LIBBY, St. Augustine, Fla., has just finished the plumbing and gas fitting in the residence of R. Canfield, and has contracted for plumbing the new house of N. W. Cooley.

THE contract for installing a heating system in the Court House at Lawrence, Mass., was awarded to W. F. Rutter of that city, who bid \$7000, in preference to Hury Bros. of Salem, who bid \$3 lower, the contract being given to the home concern. The plumbing contract was awarded to William Forbes & Co.

THE ALDEN SHEET METAL WORKING & PLUMBING COMPANY are installing the Boynton heating system in

the Kingman School at Brockton, Mass. This system was designed by James A. Harding, the New England representative of the Boynton Furnace Company of New York City.

THE AMERICAN HEATING COMPANY bid \$1080 and secured the contract for installing the heating apparatus in the Peter Cooper School, at Duluth, Minn.

HARRY SMILLIE & Co. of Rhinebeck, N. Y., have a contract for plumbing the High School Building in that town, and will use fixtures made by the J. L. Mott Iron Works of New York City.

THE BUFFALO FORGE COMPANY, Buffalo, N. Y., are using a mailing card to call attention to their Mechanical Draft Apparatus for obviating the necessity of a high chimney. The picture shows a battery of boilers connected with a high chimney which is depositing soot indiscriminately through the atmosphere. The second picture shows a similar battery of boilers, equipped with the company's Mechanical Draft Apparatus, from which no soot is arising. It is claimed that with a mechanical draft system low grades of fuel can be burned and the velocity of the fan will govern the boiler pressure automatically. The statement is also made that the first cost of the Apparatus is favorable, and that daily use will demonstrate its economy.

THE WATER HEATER MFG. COMPANY, 211 Fifth street, Milwaukee, Wis., are sending out circulars showing their Economy Steam Radiator designed to be operated by a gas burner consuming about 12½ feet of gas per hour. The steam generated from the little boiler is distributed through a series of tubes increasing the heating surface and the efficiency.

JOHN J. KEOMANE of Philadelphia has a contract of \$1750 for installing a steam heating system in St. Malachy's Roman Catholic Church in that city.

THE GRIFFITH HEATING & PLUMBING COMPANY of Spokane, Wash., are building a new warehouse on Jefferson street, adjoining the railroad, which will be a brick construction, and afford them a floor space of 10,000 square feet. The warehouse will be of strong construction, and will be used for carrying a stock of House Heating Boilers. The company have recently issued a 500-page catalogue devoted to Steam and Plumbing Supplies.

WILLIAM A. HECKMAN, 16 North Eighth street, Reading, Pa., is installing a hot water heating system in the Sisters' Home adjoining St. Paul's Roman Catholic Church, using one of the Prizer-Painter Stove & Heater Company's Boilers with 24 Radiators. He is also installing two of the same style of Boilers in the residence of Mrs. Samuel Geissler, and has, in addition, a number of other heating contracts.

FISCHER & WURTH, Jersey City, N. J., are making a special Galvanized Sheet Iron Cover for Wash Trays that is gaining some popularity in the metropolitan district.

New Firms and Changes.

THE NATIONAL LIGHT, HEAT & POWER COMPANY have been incorporated at St. Louis, Mo., with a capital of \$1,500,000. The stockholders are all said to be prominent business men of St. Louis. The company have been organized for the purpose of owning, controlling and exploiting all fundamental principles of the application of oil as fuel in burners for domestic use and for use under boilers for whatever purpose.

THE MCQUATTERS PLUMBING & MACHINE COMPANY of Hillsboro, Texas, have been organized, with a capital of \$12,000, by A. L. Lowry, A. J. McQuatters and W. R. Lang.

THE SANITARY PLUMBING COMPANY of Chicago have been incorporated, with a capital of \$2500, by Joseph Weshenbach, A. P. Tewksbury and A. J. Shaw, to manufacture Plumbers' Supplies.

JOSEPH MULLINS AND SAMUEL MILLER have recently formed a partnership and are carrying on a plumbing, tinning, gas fitting and heating business at 935 East Main street, Bridgeport, Conn., under the firm name of Joseph Mullins & Co.

The Muskingum Valley Steel Company.

The Muskingum Valley Steel Company of Zanesville, Ohio, have just completed some important additions and improvements to their plant. The main building has been extended 66 feet in length, and there have been installed in the addition a new 26 x 40 inch hot mill, with a combination sheet and pair furnace in connection; also a new double annealing furnace, a new billet heating furnace and an additional stand of cold rolls. By the addition of this equipment the company's output of black sheets will be increased about 25 per cent. and the production of sheet bars from billets 100 per cent., giving an increased production of about 750 tons of sheet bars and 250 tons of black sheets monthly. Besides these improvements the company are about to install a galvanizing department with a capacity of 25 tons a day. The whole of the company's plant has recently been overhauled and put in first-class shape. They are now turning out standard sizes and gauges of black sheets, corrugated, V crimp, roll and pressed standing seam roofing, brick siding, &c. Upon the installation of their picking and galvanizing departments they will be able to produce the finer grades of sheets, including pickled and cold rolled and polished sheets. Goff, Horner & Co., Limited, Frick Building, Pittsburgh, are the exclusive sales agents of the concern.

The Youngstown Iron Sheet & Tube Company.

The annual meeting of the stockholders of the Youngstown Iron Sheet & Tube Company of Youngstown, Ohio, was held last week at the company's offices in that city. The old Board of Directors were re-elected, with one additional member, as follows: Myron C. Wick, Robert Bentley, C. D. Hine, H. M. Garlick, William Wilkoff, James A. Campbell, H. H. Stambaugh, George L. Fordyce, all of that city, and Harry Dalton, J. L. Severance and James Parmelee, Cleveland. The directors decided not to elect a new president in the place of Col. George D. Wick, who retired from the office on his departure for Europe, but to allow the place to remain open until a later meeting. The officers elected were James A. Campbell, vice-president and general manager; W. H. Foster, secretary, and Richard Garlick, treasurer. An executive board was also chosen, consisting of Robert Bentley, H. H. Stambaugh, James A. Campbell, Richard Garlick and George E. Day, the latter being the new sales agent of the company, who recently came to Youngstown from Chicago, where he has had an extensive experience in the iron and steel business.

A New Solder.

The E. M. Lang Company, Portland, Maine, the well-known solder manufacturers, have recently introduced and are manufacturing a new product which they term Lang's Best Yet Never Slip cable wire solder. This solder is principally intended for use on capping machines and also with side seamers for making cans, or in any machine of the kind where the feed is automatic. The manufacturers state that heretofore wire solder has mainly been produced by hydraulic pressure, which is a very expensive process. The solder being forced through a small hole, or die, at great pressure the surface becomes glazed, and therefore requires a greater heat to melt it than does the new solder which the company are now manufacturing. Their process consists of casting the wire solder upon the surface of a rotating wheel from fluid metal. They claim that the solder made by this process will melt at from 10 to 30 degrees less temperature than other solder of the same mixture produced in the old way, and that a more even mixture can be produced than by any other existing process. Solder made by hydraulic pressure is not only expensive to manufacture, but, it is stated, that in the process of manufacture the tin and lead are apt to separate.

Samples of the new solder, with which the makers have furnished us, show that it presents a cable or knurled surface without the glaze which has been a dis-

advantage in other solders made by hydraulic pressure. The company have applied for a patent on their process. They state that the samples of their new solder which they have sent out to the trade have proved highly satisfactory to the users, leading to a volume of orders which will keep them busy on this product for some months to come.

Bell's Patent Roller Flange Seamer.

We give herewith an illustration of a roofing double seamer, on which a patent was recently granted to W. C. Bell of Syracuse, N. Y. It is claimed that this seamer

Bell's Patent Roller Flange Seamer.—Fig. 1.—View of Seamer.

not only does very accurate work, but is so constructed as to stand the severest tests involved in large roofing work. The jaws and folding parts are rigid and not liable to bend out of shape. An important feature is the treadle, which is said to be 1 inch longer than in any other seamers, thereby giving extra leverage sufficient to close the seams watertight and with less exertion. By a lateral construction of the hinge the face or folding side of the treadle is lowered nearly $\frac{1}{8}$ inch closer to the work. It will be seen by this that a narrow and imperfect edge is much more readily closed than is the case where the treadle has a greater swing.

Another advantage is claimed in the improved flanging jaw of the last pair, within which a steel roller is

Fig. 2.—Improved Flanging Jaw with Steel Roller.

adjusted, a portion of it projecting below the flange, as shown in Fig. 2 of the accompanying illustrations. As the flange with roller moves over jaw No. 1, as shown in Fig. 1, it carries with it a portion of the metal, forming a continuous flange by rolling it over upon gauge bar No. 1, thus avoiding the scraping process of a rough bar. The roller not only prevents tearing the seams, but makes easier work.

The jaws can also be more closely adjusted, thereby producing a square bend. The extension handles are well proportioned and bend outward at the upper sections, giving the machine a workmanlike appearance. These machines are made in two styles, No. 1 for narrow gauge and No. 2 for wide gauge. The maker states that old seamers of other makes can be supplied with Bell's patent roller flanging bar if desired.

PATTERNS FOR FLARING MEASURE WITH LIP.

(Without allowance for lap.)

In Fig. 1 is shown a finished view of a lipped measure which requires four patterns—namely, the measure, lip, handle and grasp. These measures are usually made from bright IX tin, or copper tinned on the in-

Fig. 1.—Perspective View of Finished Measure.

Now assuming that a measure is to be made holding a given quantity and knowing the size, first draw the vertical line A B in Fig. 2, upon which place the height, as shown by *a b*. At right angles to A B, draw the top and bottom diameters C D and F E respectively, as shown. Extend the lines E D and F C respectively until they meet the center line A B at A. At pleasure draw the angle or flare of the front of the lip, as shown by *d C*, extending the line *d C* until it intersects the center line A B at *c*. From *c* draw a line through D and make D *e* equal to the height of the back of the flare, which is established at pleasure, and draw a line from *e* to *d*. With *a* and *b* as centers, describe the half sections C 4' D and F B E respectively, as shown, both of which divide into an equal number of spaces, as shown by points 1 to 7 and 1' to 7'. At pleasure, draw the handle D *e f J*, and the grasp H.

For the pattern for the measure use A as center, and with radii equal to A D and A E draw the arcs E E' and D D'. At any point, as F', draw a radial line to A,

Fig. 2.—Elevation, Sections and Patterns.

PATTERNS FOR FLARING MEASURE WITH LIP.

side, and as they must hold a given quantity and must be tested before they are sold, we present below a table giving the height, bottom and top diameters for different measures from 1 gill to 1 gallon:

Size.	Bottom diameter, in inches.	Top diameter, in inches.	Height, in inches.
1 gill.....	2.06	1.37	3.10
½ pint.....	2.60	1.73	3.89
1 pint.....	3.27	2.18	4.90
1 quart.....	4.12	2.75	6.18
½ gallon.....	5.18	3.45	7.78
1 gallon.....	6.55	4.35	9.80

intersecting the arc D D' at C'. Now, starting from F', lay off on the arc E E' the stretchout of the half circle F B E, as shown by similar figures on F' E'. From the point 7 draw a line to the apex A, intersecting the arc D D' at D'. Then will C' D' E' F' be the half net pattern for the measure.

For the pattern for the handle take a stretchout of D *e f J* and place it on the vertical line D' J', at right angle to which, through points D' and J', draw the top and bottom width of the handle at pleasure, as shown by *m m* and *n n* respectively. Draw lines from *m* to *n*

on both sides; then will $m n n m$ be the net pattern for the handle. The method for obtaining the pattern for the grasp H is shown in diagram U , in which N shows the side view of the grasp enlarged from H and P the true section on the line $L M$ drawn through the center and at right angles to $x y$. Care should be taken that the distance $l l$ in section P is no wider than the width of the handle at f in the side view. Now divide the section P into an equal number of spaces, as shown by the points 1 to 4 on each side, from which parallel to $x y$ draw lines intersecting the curve of the grasp N , as shown. On the line $L M$ lay off the stretchout of the section P , as shown by similar numbers on $L M$. Through these points at right angles to $L M$ draw lines, which intersect with lines drawn parallel to $L M$ from similar intersections in the curve N . Trace a line as shown by $1 r 1 s$, which will be the pattern for the grasp.

While the lip $d C D e$ in side view is a frustum of a right cone and can be developed by the cone method, a shorter rule which can be applied, and which answers the purpose just as well, is shown in Fig. 3. With radius equal to $c D$ in Fig. 2 and c in Fig. 3 as center, describe the arc $C^1 D^1$. From c drop a vertical line $c d$, intersecting the arc just drawn at 1. Now starting from the point 1 set off on either the number of spaces contained in the half section $C 4' D$ in the side view in Fig. 2, as shown by similar numbers on the arc $C^1 D^1$ in Fig. 3. From c draw lines through the points 7 and 7, making $7 e$ on both sides equal to $D e$ of the back of the lip in the side view in Fig. 2. Now take the distance of the front flare of the lip $C d$ and place it, as shown, from 1 to d in Fig. 3. Draw a line from e to d , which bisect and obtain the point f . From f , at right angles to $e d$, draw the line $f i$, intersecting the center line $c d$ at i . Then, using i as center and $i d$ or $i e$ as radius, describe the arc $e d e$, intersecting the radial lines $c e$ and $c e$ at e and e . Then will $e d e D^1 1 C^1$ be the net pattern for the lip.

Standard Tin Plate Company.

A company, with a capital of \$300,000, have been organized at Canonsburg, Pa., under the style of the Standard Tin Plate Company, to build and operate an independent tin plate plant. At a meeting of the stockholders, held last week, the following directors were chosen: W. I. Berryman, S. A. Taylor, Pittsburgh; Joseph Underwood, Roscoe; M. H. Bermis, Albert Ross, Monessen; James E. Elliott, Fayette City; E. Jeffries, J. V. H. Cook, S. L. Kennedy, George C. McPeake, E. B. Boyle, J. L. Cockins, C. C. Johnson, Moses Hickman, E. T. Hitchman. The board organized by electing E. Jeffries president and general manager, M. H. Bermis secretary, and J. V. H. Cook treasurer. Edmund Jeffries, who is the leading spirit of the enterprise, is a practical millman. It is proposed to erect an eight-mill plant, probably on land of the Cecil Improvement Company on the north side of Chartiers Creek, between Canonsburg and Morgantown.

Lion Brand Soldering Salts.

Drake & Mills, Cleveland, Ohio, are introducing to the trade their Lion brand soldering salts. This is a white granular salt put up in $\frac{1}{2}$ and 1 pound bottles. It is claimed to be the best flux possible in all forms of soldering, both for inside and outside work, as it cleans and tins the copper and removes all grease from the work, at the same time making the solder flow readily and evenly. It is cheaper and more reliable than acid, is always ready by the addition of a little water to the salts and can be mixed as needed. The manufacturers point out that the time saved by the use of these salts is quite an item, as the salts dissolve as soon as the water is added and the workman loses no time waiting for the solution to dissolve or by making several attempts to solder the same piece. It is also claimed that neater work is obtainable with the salts, as an even flow of solder is obtained where it is used. These salts have been used for several years by many local firms and its success with them has led the manufacturers to reach out

over a more extended territory. They are now prepared to furnish these salts in any quantity and to ship them to any part of the country.

The Valve-Light Ventilator.

Martin J. Frand & Co., 110 and 112 Arch street, Camden, N. J., are making the patent valve-light ventilator, of which we give an illustration. This ventilator produces the very desirable combination of light and ventilation. Heretofore such a combination was only made possible by the use of unsightly chains, wheels and other complicated devices, which either barred out the light or proved offensive to the eye. It is claimed that in this device these obstacles are entirely removed. In place of a complicated or cumbersome apparatus, there are neat wrought iron rods so arranged that a short movement of the center rod (which is accomplished either by a pole and hook or by use of a chain or cord and wheel, which may be attached to the crossbar), operates the four arms and causes them to open or close the side valves, as the case may be, while the center rod itself, being directly connected with the top valve, operates it.

An important feature of the ventilator is that the valves can be regulated to a large or small opening as desired, and when closed they are absolutely storm proof.

The Valve-Light Ventilator.

Another feature is that it can be used in connection with a ceiling light by simply extending the rod through the same, giving ventilation to the room and also to the space between the ceiling and the roof. The valves have a greater area for the passage of air than the base of the ventilator proper, thus removing any danger of the choked conditions so prevalent in some styles of ventilators. These ventilators are furnished complete with movements and glass, and require only the setting of the glass in place, on the building, to render them complete for use. The material used in the construction is either copper or galvanized iron. The ventilators are regularly made in sizes 30, 36, 48, 60 and 72 inches square, with an additional allowance of $2\frac{3}{4}$ inches all around for curbing. Special sizes are also made when desired.

Follansbee Brothers Company.

Work will be pushed actively on the new sheet and tin plate mill to be erected by Follansbee Brothers Company of Pittsburgh at Mahan Station, near Wheeling, W. Va., and referred to in these columns recently. In addition to four sheet and four tin mills the plant will contain sufficient cold rolling capacity for all the black plate and sheets produced and a galvanizing and corrugating plant will also be operated. The main building will be 480 feet long on one side and 440 on the other side, and will be 205 feet wide, with L's on each end. There will be 16 sheet and pair furnaces and nine gas producers. The boiler house will be 45 x 90 feet. A machine shop, tin house and warehouse will also be erected. Follansbee Brothers Company have 230 acres of land at the above place, and it is probable a large tract of it will be laid out in lots, on which homes will be erected for the employees of the mill.

Some Meurer Goods.

Meurer Bros. Company, Brooklyn, N. Y., have issued an addendum to their catalogue published in 1900, containing some of the new lines of goods which they are manufacturing and handling. Special notice is given to aluminum coated steel, which they recommend for use in place of galvanized iron for roofing and guttering purposes. The company are now making corrugated expanding conductor, round and square, plain round lock seam conductor, riveted and soldered conductor, plain square conductor, half round O. G. and box gutters, corrugated and plain elbows and shoes and adjustable elbows in aluminum coated steel. They claim that, owing to the lasting qualities of this material these pipes and elbows will wear practically as long as the building on which they are used and will not need the constant repairing that galvanized leader and gutter require. They also recommend aluminum coated steel for use in smoke pipes. The company carry smoke pipe of this material in all sizes. Other new goods contained in this addendum are Meurer felt roofing, Meurer roofing paint, Meurer black enamel paint, wall and register boxes, tin starters, oval three-pieced elbows, square tin elbows, oval tin hot air drums and Græco-Roman registers and register borders.

An Improvement in Laying Shingles.

The Galesburg Cornice Works of Galesburg, Ill., who manufacture architectural sheet metal work, have been placing on the market a stamped metal hip shingle for the protection of hips on shingle roofs. The shingles are stamped from tin or galvanized iron in an ornamental design, and are of suitable length to be laid in each course of shingles, so that the hip covering will have sufficient lap, while they are constructed so as to be self adjusting to different widths of shingle exposed to the weather. A small off set or shoulder in the side of the metal shingle, made to fit closely against the butts of the wood shingle, serves as a gauge in putting them on and effectively closing up the inevitable triangular opening that would be left at this point if a continuous metal or wood covering were used. The point is made that while the hip shingles are ornamental and make a pleasing finish for the hip lines of a roof, they are inexpensive, costing only a little more than the plain pieces of tin that are commonly used.

FLASHINGS.

THERE is little room for doubt that the American Tin Plate Company's wage proposition has been rejected by the Amalgamated Association. Whether any further effort will be made to seek an agreement remains to be seen. At present about 130 of the mills owned by the American Tin Plate Company are closed down for repairs or lack of business. This will involve a material reduction in the year's production of Plates.

It is reported that the American Sheet Steel Company's plants at New Philadelphia, Canal Dover, Dresden, Dennison and Canton, Ohio, embracing a total of about 36 hot mills, have been shut down indefinitely. The suspension of operations at these plants is said to be due to a falling off in orders for Sheets. The company seem to be closing down their smaller mills and concentrating the work in the larger plants at the present time.

SOME extensive improvements are being made at the Wellsville, Ohio, plant of the American Sheet Steel Company. Four additional hot mills are being erected with a new building to accommodate them, also additional annealing furnaces, while a fine new office building is in course of erection. The four additional hot mills will make Wellsville a ten-mill plant and give employment to about 200 more men. Two of the new mills are expected to be in operation by September 1, and the other two about January 1.

THE ATLANTA ROLLING MILL & TIN PLATE COMPANY, Atlanta, Ind., have let the contract for the steel construction for their new eight-mill Tin Plate plant to the Garry Iron & Steel Company of Cleveland, Ohio. The engines will be built by the Bass Foundry & Machine

Company of Fort Wayne, Ind., and the mills by the Lloyd-Booth department of the United Engineering & Foundry Company, Pittsburgh.

THE NEW JERSEY GALVANIZING & TINNING WORKS, with principal office at 50 Elm street, Newark, N. J., have been incorporated with a capital stock of \$10,000.

J. CALLAGHAN & SON, sheet metal workers and roofing contractors, have completed their new factory and store building at 623 Superior street, Cleveland, Ohio, and have moved into it from their old quarters on Erie street.

DISTRICT MANAGER C. A. ROBINSON of the American Tin Plate Company has written a letter to the local lodge of the Amalgamated Association at Martin's Ferry, Ohio, stating that the closing down of the Laughlin plant at Martin's Ferry and the La Belle plant at Wheeling, W. Va., was due to lack of orders and not at all to the fact that the workmen had voted against the wage proposition of the American Tin Plate Company or to coerce them to take favorable action on the proposition. Mr. Robinson said that work will be resumed at both of the mills named as soon as sufficient business is secured to enable the company to start them.

THE CADWALLADER TIN PLATE & METAL COMPANY, Pittsburgh, have recently added a new smelting furnace and two refining furnaces to their plant situated at Elizabeth street and the B. & O. Railroad, which puts them in shape to furnish all grades of Terne and Babbit Metals to the trade.

THE TUSCORA STEEL COMPANY of Newcomerstown, Ohio, have arranged with the Allegheny Steel & Iron Company of Pittsburgh to be supplied with Steel Bars for use in their plant, the Tuscora Company furnishing the Allegheny Company in return with Sheets, which are being used to fill regular orders.

THE KAST COPPER & SHEET IRON COMPANY of Buffalo, N. Y., have been incorporated with a capital stock of \$50,000 by Richard Kast, Conrad J. Kast and August Becker.

THE HUB CAN COMPANY of Portland, Maine, have been incorporated with a capital stock of \$10,000 to manufacture Cans. The officers of the company are D. A. Meaher, president, and E. S. Moody, treasurer, both of Portland.

THE PARKERSBURG IRON & STEEL COMPANY, Parkersburg, W. Va., have about completed their new Bar mill and will shortly begin the construction of a new annealing furnace and an addition to their rolling mill.

It is reported that the American Can Company contemplate the building of a Tin Can factory at Woodstown, N. J.

THE newly incorporated Canonsburg Iron & Steel Works, who have purchased the property at Canonsburg, Pa., formerly owned by the American Tin Plate Company, have organized with the following Board of Directors: John F. Budke, John M. Watson, W. H. Paxton, George D. McNutt, Ralph Martin, Geo. Retberg, John G. Paxton, R. L. Park, H. A. Quail. The board effected the following organization: President and general manager, John F. Budke; vice-president and business manager, John M. Watson; secretary, George Retberg; treasurer, W. H. Paxton. The work of remodeling the mill will be begun at once, and the contemplated improvements will make it an up to date plant in every respect.

THE EMPIRE IRON & STEEL COMPANY, Niles, Ohio, are installing a Sheet Bar mill in their new plant.

THE ROLLING MILL COMPANY OF AMERICA are installing a blooming mill and a bar mill in their new plant at Morgantown, W. Va.

THE ALAN WOOD IRON & STEEL COMPANY are erecting a Billet and Slabbing mill at their plant at Conshohocken, Pa., to roll Bars for the Alan Wood Company's Sheet plant. The open hearth department will have a sufficient Steel capacity to supply the company's Sheet department and leave a surplus of about 100,000 tons annually.

It is reported that in consequence of the recent strike at the mills of the Ashland Sheet Mill Company, Ashland, Ky., owing to the refusal of President I. A. Kelly to sign the scale of the Amalgamated Association, the plant will hereafter be operated as an open mill. The

company state that they will pay strictly the Amalgamated Association scale of wages, but will not recognize any association or union. All grievances will be taken up with the employees individually and differences adjusted to mutual satisfaction. The striking members of the Amalgamated Association at the Ashland plant declare that they will not return to work under these conditions. The Ashland Sheet mill has been in operation only three or four months.

A NEW LODGE of the Amalgamated Association of Iron, Steel and Tin Workers was recently inaugurated in connection with the plant of the Jackson Iron & Tin Plate Company, Clarksburg, W. Va.

It is stated that the Jackson Iron & Tin Plate Company, Clarksburg, W. Va., will shortly begin the construction of an additional plant of eight mills for the manufacture of Black Sheets for stamping purposes.

THE ENAMEL STEEL TILE COMPANY, recently organized at Bellaire, Ohio, with a capital stock of \$50,000, have purchased a building and are now vigorously pushing the work of building furnaces, placing machinery, &c., for the extensive manufacture of their Enamel Steel Tile, for wainscoting, ceilings, mantels, hearths, &c. This Tiling will be made in all sizes, designs and colors, bringing out mottled effects. The manufacturers claim that it will not craze or chip off, never requires repainting and can be cleaned like china. The company's offices are located in their factory building, at the corner of Twenty-eighth and Water streets, adjacent to all railroads and the business center of the city.

Two Sheet mills are running at the present time at the plant of the Tuscora Steel Company, at Newcomerstown, Ohio, and two additional mills will be placed in operation later.

W. C. REILLY, auditor and acting superintendent of the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, has been appointed general superintendent of the plant.

THE GALVANIZED IRON COMPANY of the City of Mexico, a successful concern in which citizens of the United States are interested, held a general meeting of their stockholders August 1.

THE report that the works of the Ohio Galvanizing & Mfg. Company, Niles, Ohio, had been shut down for an indefinite length of time on account of the strike is incorrect. The strike caused them to close down for only three days, and they are now running as usual.

THE FERGUSON TIN PLATE COMPANY, INCORPORATED, of Pittsburgh, have been granted a charter with a capital of \$20,000. They will take over the present business of the Ferguson Tin Plate Company, operating a dipping plant in that city.

To make a ventilating Skylight a pleasure to the owner it must operate easily and smoothly, and the G. Bickelhaupt Skylight Works, 243 and 245 West Forty-seventh street, New York, call attention to their G. B. Skylight Lift and the G. B. Automatic Self Locking Scuttle Opener, which is said to be safe, secure and affording a quick escape in case of fire. They have gotten out a pamphlet giving full particulars.

THE ART MODELING WORKS, 832 Market street, Camden, N. J., make a specialty of preparing Dies for all kinds of Artistic Metal Work, Statuary, Ceiling and Side Wall Panels, Vanes, Finials and special designs. They are prepared to work directly from architects' drawings, and cornice makers who require work that they are not equipped to make are invited to correspond to secure information on such work.

THE NIAGARA MACHINE & TOOL WORKS, Buffalo, N. Y., are calling attention to the large variety of Foot and Power Working Squaring Shears they make having capacity for cutting from 2 to 11 feet and from the lightest sheets to 1/4-inch plate.

THE GEORGE A. HOGG IRON & STEEL FOUNDRY COMPANY of Pittsburgh, Pa., are equipping the annealing furnaces of the American Tin Plate Company's National Works, at Monessen, Pa.; United States Works, at Demmler, Pa., and American Works, at Elwood, Ind., with the Freeman Patent Furnace Charger.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

HEATING MAIN SHOULD RISE.

From M. & M., College Corners, Ohio.—Will you please inform us if the method of piping to a radiating coil from a stove, shown in the accompanying sketch, is calculated to secure a good circulation and satisfactory heating? We aim to run a coil of 1 1/2-inch pipe through the fire twice, then reduce it and connect it with a 3/4-inch pipe, carrying the hot water from the heating coil to a radiating coil and returning by means of a 3/4-inch pipe to the coil in the stove again, as shown. Both of the pipes will run a distance of about 45 feet and practically on a level. Will the water circulate properly with the pipes run in this way? Would it be better to have the cold water return pipe carried under the floor?

Note.—It would be far better to use 1-inch pipe between the heating coil in the stove and the radiating coil, and this pipe should be carried up to the ceiling and then run over to the coil, where it should drop down and connect with it. At the highest point an expansion tank should be connected; otherwise if the

Heating Main Should Rise.

system was full of water the expansion of the water on heating would be sufficient to burst it at the weakest point. The size of the room in which the radiating coil is to be placed and the amount of surface which it is to expose are not given, nor is the size of the fire chamber in the stove. The flow and return pipes, however, being 45 feet long, will expose a surface, if of 1-inch pipe, of 30 square feet, and unless very carefully covered would throw off a great deal of heat from the water and leave very little for the radiator. In a heating system of this character it is doubtful if the fire in the stove could be run sufficiently hard, and if there would be enough of it for 1 square foot of heating surface in the pipe coil to carry more than 15 to 20 square feet of surface in the flow and return pipes and the radiating coil. Consequently, unless the flow and return pipes were covered, 2 square feet of the surface exposed in the heating coil, or 4 lineal feet, would be required for keeping up the temperature in the flow and return mains. If the radiating coil was to expose 30 feet of surface it would take about 4 feet more, or 8 feet altogether, of 1 1/2-inch pipe in the stove.

When water is carried so far it is probably better to estimate that 1 square foot of surface in the radiating coil would not heat more than 25 cubic feet of space in the room to be heated. In fact, the size of the room to be heated governs the size of the coil that must be placed in the stove. With the information given, our correspondent can doubtless make the necessary calculations to determine the advisability of his scheme. The piping, however, must be so run that all air can escape as it is filled with water, and the expansion tank must contain as much space as at least 1-23 of the bulk of

the water that is required to fill the piping; otherwise when it is heated and expanded it would overflow.

The book "Kitchen Boiler Connections," which can be furnished by our Book Department, has two chapters devoted to similar work.

PATTERN FOR A "HEAD" TO FILL THE END OF A CORNICE CUT OFF OBLIQUELY.

From G. E., New York City.—Please inform me through the columns of *The Metal Worker* how to cut the pattern for a "head," or end piece, to fill the end of a cornice when the latter is cut off at an angle other than a right angle, as shown in the sketch sent herewith.

Answer.—In the accompanying illustration is shown a reproduction of our correspondent's sketch, together with the method of laying out the required end piece. In the sketch the profile of the cornice is drawn in the manner shown at B, which position would be correct were the view an elevation instead of a plan. As the profile shown is that usually employed in a crown mold, it is clear that it should occupy the position shown at A, since the points 1 and 2, being its points of extreme projection, should be on the line F G, which is the line of extreme projection from the wall in plan. We call

tersection on D F carry lines at right angles to the same indefinitely, as shown at the left. From the several points in profile A also carry lines at right angles to D E, cutting the same as shown by the small figures between M and N; corresponding with those of the profile. Now transfer the points in M N to the line D H, seeing that each point maintains the same relative distance from all of the other points, as on M N; and from each of the points on D H project lines at right angles to the same cutting lines of corresponding number previously drawn from D F. A line traced through the points of intersection, as shown by O P R S, will be the shape of the required end piece.

The miter of the cornice moldings to fit against the end piece is an ordinary butt miter, of which D E is the miter line, and the same set of points may be used with convenience in cutting both pieces.

PATTERNS FOR A CHIMNEY TOP.

From Henry Weyand, Waterbury, Conn.—In *The Metal Worker* of August 2, 1902, in answer to an inquiry from "J. L., New Brighton, S. I.," you have presented a pattern of a chimney top which, if manufactured, we would consider an infringement on our ventilator, styled

Pattern for a "Head" to Fill the End of a Cornice Cut Off Obliquely.

attention to this because a correct drawing is the first essential to a correct result. Failure or inability to develop the pattern results in many instances from the fact that a drawing has not been first made in which the required conditions are correctly shown.

There is also some doubt implied in the sketch as to whether the angle in the wall at which the cornice ends is an interior or an exterior angle. It would seem rather to show an interior angle, but since if it were an interior angle the end of the cornice would come against the wall on the other side of the angle, and would therefore scarcely require a full end or "head," we have in our drawing shown a cornice at the end of a wall terminating with an exterior angle. In either case the method employed is the same. Care must be taken, however, to see that the profile is correctly placed—that is, with the points 0 and 14 at the wall line, and the points 1 and 2 at the line of extreme projection. Therefore, if C F G were the wall line instead of C D E, as shown, and D E were the line of extreme projection, instead of F G, the profile should be turned over so that the points 0 and 1 would change positions with each other.

Considering, then, that C D E is a plan of the wall, and that F G is the line of extreme projection of the cornice, we first extend the line C D, as shown, by D F, this line showing the position in plan of the end or "head" required to fill the opening produced by the oblique termination of the cornice. Divide the curved portions of the profile into any convenient number of spaces and number all points and angles of the profile, as shown by the small figures on profile A. From each of the points project lines parallel to D E, cutting the line D F, as shown, and from the several points of in-

the new Pancoast patent ventilator and chimney cap, letters patent on which were issued to R. M. Pancoast on March 27, 1900, the number of the patent being 646,371. We purchased this patent from the inventor, R. M. Pancoast, and inclose Patent Office literature in support of our claim. We of course understand that you submitted this plan, being unaware of the fact that the same would conflict with our patent, and we now ask you to publicly give us credit for the ownership of the patent in the next issue of *The Metal Worker*.

RUSTING OF GALVANIZED IRON ROOF.

From J. P. F., Hartford, Conn.—Having noticed in your issue of August 9 a complaint from "C. & H." regarding the rusting of a galvanized iron roof, I would say: Never lay a new metal roof of any kind over the old metal roof. Rip it off. It does not allow condensation to dry. The roof boards will absorb it. A rosin sized sheathing paper is desirable. The same applies to the mistake frequently made of laying a new gutter over an old one. If there is a closed space between the roof and the ceiling, ventilators or openings in the wall should be applied at the front and rear. If the ceiling comes close against the roof boards, ventilators are also necessary.

WHO MAKES THE NEW MODEL BENCH DRILL?

From Charles Schneider, Catasauqua, Pa.—I should be glad to learn where I can secure repairs for the New Model bench drill, made by J. W. Manus of Rochester, N. Y., who seems to have gone out of business.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and has declined $\frac{1}{2}$ c. in price.
Copper is in light demand and slightly lower.
Pig Lead is dull and firm.
Spelter continues scarce and strong, with light demand.
Antimony is unchanged and quiet.
Nickel is in fair demand and slightly lower in large lots.
Aluminum is firm and in good demand.
Tin Plates are very quiet and unchanged in price.
Black Sheets are very quiet, with prices tending lower.
Galvanized Sheets are extremely dull.
Wrought Scrap Iron is strong and higher.
Scrap Brass and Copper are dull and weak.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in fair demand and firm in price.
Sheet Zinc is firm; demand is moderately active.
Hardware is active for the season and prices are strong in most lines.
Plumbers' Supplies are in fairly strong demand, with prices ruling firm.
Wrought Steel Sinks are about 10 per cent. higher and active.
Radiation was advanced 5 per cent. on August 12, owing to high price of Iron.
House Heating Boilers have been marked up 5 per cent. for the same reason.
Sad Irons are 5c. to 10c. per set higher.
Washing Machines have been advanced 25c. to 50c. each.
Wire Nails are in fair demand, with prices firm.
Cut Nails are unchanged and in moderate demand.
Linseed Oil is in moderate demand at former prices.
Spirits Turpentine is about $\frac{1}{2}$ c. a gallon higher in price.

METAL MARKET.

NEW YORK, August 15, 1902.

Pig Tin.—A decided change has come over the Tin market since last week. Prices have tended downward, owing to an abrupt decrease in manipulation and freer arrival of the metal at this port. The consumptive demand is not quite as good as it has been, and reports from Tin Plate manufacturers are decidedly averse to any increase in the consumption of Tin for this industry in the near future, owing to the closing down of a large number of mills. Prices rule about $\frac{1}{2}$ c. below those of a week ago. Jobbers quote Straits Pig in small lots at 29c. to 29 $\frac{1}{2}$ c. per lb. The arrivals so far this month aggregate 1430 tons, and another steamer, now overdue, has 874 tons on board.

Copper.—The market for Copper has declined perceptibly in the past week and closed with a very weak tone. Offerings have been heavy and buyers seem indisposed to purchase beyond the limit of their actual current needs, preferring to await further developments in the market. Jobbers quote Lake Ingot in small lots at 13c. per lb. and Casting Copper from 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c.

Sheet Copper.—A good demand for Sheet Copper continues and the outlook favors a steady continuance of business in this material, a large amount of which is being used in high class building operations all over the country. Prices remain firm on the basis of 18c. per lb. from store.

Pig Lead.—The market is entirely unchanged, remaining quiet and steady at the prices ruling for some considerable time past. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices report the volume of transactions in the Lead market at that

point as showing but slight variation from that reported the previous week, with quotations unchanged.

Spelter.—The firm tone in the Spelter market is maintained and prices have continued to advance. The scarcity of spot metal is unbroken and the market is further strengthened by the advices from the West, which indicate extreme firmness. Jobbers quote good Western brands in small lots at 6c. to 6 $\frac{1}{2}$ c. per lb.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions, and prices are firm and unchanged at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

Antimony.—No change is noted in this metal. Cookson's in small lots is quoted at 10 $\frac{1}{4}$ c. to 10 $\frac{1}{2}$ c. per lb., Hallett's at 8 $\frac{5}{8}$ c. to 8 $\frac{7}{8}$ c. and U. S. at 8 $\frac{1}{2}$ c. to 8 $\frac{3}{4}$ c.

Nickel.—The price of this metal in the wholesale market shows a further decline, although no change has been made in retail quotations, which rule at about 55c. to 60c. per lb. for small lots.

Aluminum.—The demand for Aluminum continues active and prices remain at their former level, small lots of No. 1 Ingot, guaranteed 99 per cent. pure, being quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—Conditions in the Tin Plate market do not vary from those outlined in our reports for the last few weeks. The demand is slow so far as business of any proportions is concerned, although a better volume of orders was noted among the retail trade this week. Stocks are understood to be accumulating at mills, but the closing down of a large proportion of the American Tin Plate Company's capacity will probably tend to counteract any excessive surplus and prevent radical decline in prices. Prices for small lots show no change. Jobbers quoting American Bessemer Coke Plates, IC, 14 x 20, in moderate size lots, delivered at New York and corresponding points, at about \$4.70 to \$4.90 per box.

Sheets.—Comparatively little demand is noted for Black Sheets, especially for those of the lighter gauges, and some shading of prices is said to have been done by some of the independent mills who are seeking business. The market, however, does not show any general decline. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at about 3.70c. The Galvanized Sheet trade is in a very unsatisfactory shape, orders having fallen off materially. Small lots are quoted at 4.55c. to 4.65c. for No. 27. It is said that some Black Sheets are being sold by mills for next year's delivery at current rates, the mill guaranteeing against a decline.

Chicago advices are as follows: Some little improvement is noted in the demand for Light Sheets and the market is less depressed, but Galvanized are still slow. Quotations are as follows: No. 27 Black Sheets, in small lots from store, 3.45c. to 3.55c. Galvanized Sheets in small lots from store are sold at 4.55c. to 4.65c. for No. 27.

Old Metals.—The market for Scrap Iron continues strong. Wrought Scrap is in particularly good demand and has advanced in price. Scrap Copper and Brass are weak. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

Heavy Copper	per lb.	10 c.
Light and Tinned Copper	per lb.	9 c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6 $\frac{1}{2}$ c.
Lead	per lb.	3 $\frac{3}{8}$ c.
Tea Lead	per lb.	3 c.
Zinc	per lb.	3 $\frac{1}{4}$ c.
Pure Aluminum Sheet	per lb.	22 c.
Cast Aluminum	per lb.	17 c.
No. 1 Pewter	per lb.	18 c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton		to \$5.00
Wrought Iron Scrap, per gross ton		\$15.00 to 15.50
Heavy Cast Scrap, per gross ton		12.50 to 13.00
Stove Plate Scrap, per gross ton		9.50 to 10.00
Burnt Iron, per gross ton		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—The market is a little quieter, with quite free offerings of foreign Pig Iron for early and extended delivery. Quotations for spot Iron are difficult to make, the price depending entirely upon the necessities of the buyer. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$22.75 to \$24.75; No. 2 X, \$21.75 to \$22.75; No. 2 Plain, \$20.75 to \$21.75. Tennessee and Alabama brands, in New York and vicinity, No. 1 Foundry, \$22 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$20.75 to \$21.25.

CHICAGO.—The withdrawal of more than half the Southern furnaces and the sale of nearly three-quarters of the output of the South for delivery during the first half of 1903 proves the stringent conditions in the Pig Iron market. The principal Northern furnaces, too, can take little more tonnage for the first half of next year. The result is an advance of 50c. to \$1 per ton on Southern Iron, and from \$1 to \$2 per ton on Northern Iron; and in some instances even higher prices are demanded. The volume of business has been less during the week, due more to the inability of the furnaces to contract than to any cessation in the demand. While sales of Southern Iron have been made to a moderate extent on a basis of \$17 for No. 2 Foundry, Birmingham, other furnaces are demanding and obtaining 50c. to \$1 per ton more. A few lots of spot Iron have been sold in single carloads at \$26.15 for No. 1 and \$25.65 for No. 2 Foundry, but scarcely any more Iron can be obtained at these prices. The following are the prices current for July, 1903:

Lake Superior Charcoal.....	\$26.00 to \$27.00
Local Coke Foundry, No. 1.....	22.50 to 23.00
Local Coke Foundry, No. 2.....	22.00 to 22.50
Local Coke Foundry, No. 3.....	21.50 to 22.00
Local Scotch, No. 1.....	23.00 to 23.50
Southern Coke, No. 1.....	21.90 to 22.40
Southern Coke, No. 2.....	21.15 to 21.65
Southern Coke, No. 3.....	20.65 to 21.15
Southern Coke, No. 1 Soft.....	21.65 to 22.15
Southern Coke, No. 2 Soft.....	21.15 to 21.65

PHILADELPHIA.—American Iron for prompt delivery is scarcer than ever; it is no longer a question of price, but of absolute inability to supply the demands of consumers. Those who can spare a little Iron for their customers get \$23 to \$23.50 for No. 2 X Foundry, and in some cases \$24 and more has been paid, with little or no chance of lower prices this year, as there is practically no Iron for sale. For the first quarter of 1903 considerable business has been done at about \$22.50 for No. 2 X Foundry, and for the second quarter at \$22. Scotch Irons demand \$22 to \$22.50 for some brands, but a few of the best bring \$23.50 to \$24, delivered in buyers' yards, the general market being about as follows for city or nearby deliveries during the first half of next year, with a premium of \$1 to \$1.50 per ton on this year's delivery:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.00 to 22.50
No. 2 Plain.....	21.00 to 22.00

PITTSBURGH.—Buying of Foundry Iron for next year has dropped off considerably, although some fair sized orders were taken this week. A number of the largest foundries of this district are still holding off, but are expected to come in early next month. There is a heavy demand for small lots of spot Foundry, and as high as \$25 has been paid for No. 2. For next year we quote No. 2 Foundry at \$21.50 to \$22.50, Pittsburgh.

CINCINNATI.—A considerable amount of Pig Iron was sold this week for delivery during the first half of next year. Many of the Southern furnaces have instructed their agents to sell no more Iron for them, as they are practically out of the market for an indefinite period. The basis on which Southern Iron is being sold is that of \$17.50, Birmingham, for No. 2. Northern furnaces have been selling considerable Iron for next year's delivery on the basis of about \$22.50. We quote, f.o.b. Cincinnati, for 1902 delivery, as follows:

Southern Coke, No. 1.....	\$22.75 to \$26.25
Southern Coke, No. 2.....	22.25 to 25.75
Southern Coke, No. 3.....	21.75 to 25.25
Southern Coke, No. 4.....	20.75 to 21.75
Southern Coke, No. 1 Soft.....	22.75 to 26.25
Southern Coke, No. 2 Soft.....	22.25 to 25.75
Ohio Silvery, No. 1.....	26.10 to 26.60
Ohio Silvery, No. 2.....	25.85 to 26.10

Lake Superior Coke, No. 1.....	26.10 to 26.60
Lake Superior Coke, No. 2.....	25.60 to 26.10
Lake Superior Coke, No. 3.....	25.10 to 25.60

CHICAGO REPORT.

Scrap Iron and Steel.—The offerings have been light and with a good demand from dealers the market has been strong with further advances paid for Wrought Scrap and Breaking Stock. The following are the prices paid by dealers in carload lots, Chicago:

	Per net ton.
Country Wrought Scrap.....	\$15.00 to \$16.00
Machinery Cast.....	13.50 to 14.00
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	10.00 to 10.50
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plow Steel.....	12.00 to 13.00
Breaking Stock.....	11.00 to 12.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	13.00 to 14.00
Old Gas Pipe and Boiler Tubes.....	13.00 to 13.50
Cast Borings.....	9.00 to 9.50
Turnings.....	12.50 to 13.00
Horseshoes.....	14.50 to 15.00

Old Metals.—The market has been slow and weak for Copper and Brass, with prices of nearly all kinds lower. Zinc, however, has been in good demand and stronger, with higher prices paid. The following are the prices paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10½c.
Copper Bottoms.....	9½c.
Copper Clips.....	10½c.
Red Brass.....	10½c.
Yellow Brass.....	8 c.
Red Brass Borings.....	9½c.
Yellow Brass Borings.....	7½c.
Light Brass.....	6½c.
Pipe Lead.....	3.70c.
Tea Lead.....	3.35c.
Zinc.....	3.45c.
Tin Foli.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—The market has been easier, with more ample supplies and only a moderate outlet. Outside Tubing is lower. Dealers buy at the following prices, Chicago delivery:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5 c.
Black Rubber.....	4 c.
White Rubber.....	8½c.

Rags.—The market continues to improve in tone, with only moderate receipts and a fair demand from dealers, who are paying 75c. to 85c. per 100 lbs. for Country Mixed Rags, Chicago delivery.

Anthracite Coal.—The local market naturally reflects conditions in the East and dealers anticipate that local supplies, while light, will be ample to meet necessities until the resumption of work at the mines, which is anticipated early in the winter at the latest. There has continued to be a moderate movement on old contracts. The following are the prices current, subject to a discount of 10c. per ton for shipments made during the month of August:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE W. J. CLARK COMPANY, Salem, Ohio, who make the improved Fire Hose Couplers known as the Quick-as-Wink, report a fine trade in those Couplers. The trade in them has been growing steadily since their first introduction some years ago, but too slowly for much profit until within the past few years. The Couplers have advertised themselves splendidly in cities and towns where they have been in use, so that now the demand for them has made it necessary to increase facilities for turning them out.

W. B. HARRIS, ROBERT STEINER AND R. M. MOTHNER have incorporated the Steiner-Harris Oil Burner Company of Beaumont, Texas, with a capital stock of \$5000, to manufacture Oil and Gas Burners.

THE HARDWARE TRADE.

The most interesting feature of current business is the urgency with which manufacturers of general Hardware are solicited to hasten deliveries on orders booked in June and July. Such orders are not old, when present conditions are considered, and shipments in three months would be deemed a good delivery; but the buyers say they are running short of goods and must have additional supplies. Some of the most urgent appeals come from merchants who were not long since of the opinion that they were comfortably stocked. The heaviest demand for quicker shipment comes from the West, where the influence of the heavy crops is always felt earliest. Factories are running to their full capacity and are unable to accumulate stock. If jobbers are already running short the scarcity will be pronounced when fall trade is in full swing. In some branches, notably in those in which great combinations are operating, increasing competition has brought about an oversupply and some weakening in prices is seen, as, for instance, in Wire Nails, Sheets, Tin Plates and Shovels. In view of the experience of the past year, however, weakness in these lines is not necessarily to be expected to extend to other branches of the Hardware trade. The prospects for a large volume of business as the fall opens up are too good for the general line to be affected. On the other hand, the demand may be found sufficiently heavy as the season advances to take up the capacity of establishments in those branches which are now suffering from overproduction.

NOTES ON PRICES.

Lead Goods.—The advent of the new combination of Lead interests is causing considerable uneasiness to the Lead trade. It seems to be the object of the promoters of the consolidation to compel the manufacturers of Pipe, Sheet and Traps and Bends to dispose of their plants and good will at prices named by the promoters. To show that the promoters of the scheme mean business and that they are in the market as competitors of the older established houses, they have this week issued prices to the wholesale trade which show a cut under the prices prevailing for some time. The lines affected are Lead Pipe, Sheet Lead, Red Lead, Lead Ferrules, and in fact the complete line made by the concerns for whose plants the proposed combination could not secure satisfactory options. In some quarters the issuing of the prices unsolicited is looked upon as an effort on the part of the combination to feel their way in the market and determine, if possible, whether or not trade can be secured by direct competition. If this is found to be the case, and trade can be secured directly to a satisfactory extent, it is the opinion of those who have authority to speak, that the trust will refuse to purchase the old established concerns and simply fight them out with low prices and a curtailed supply of raw material. It will take but a short time to determine the issue, and if the result is not satisfactory efforts are likely to be made again to procure options on the principal plants controlling the Lead business.

Cast Iron Soil Pipe and Fittings.—The outlook of Cast Iron Soil Pipe and Fittings is, from the manufacturer's point of view, very encouraging, but from the jobbing and retail point of view it is unsatisfactory. The business at the present time is very good, and if the present demand continues the trade may expect an advance in the very near future. The principle on which almost all advances have been made in this line has been to reap a profit when there was a demand for the ware. There are very few of the manufacturers who have been compelled to purchase their Pig Iron or other raw material at the present prices, but they are extremely anxious to advance in accordance with the market. All of the manufacturers are said to be making handsome profits on their output and there is no fear of the market suffering a backward movement. The price of the raw material alone will at the present time keep the market steady, and if the present satis-

factory demand continues prices must certainly be advanced.

Wrought Steel Sinks.—The demand for Wrought Steel Sinks is referred to as very active this season, and prices on these goods have been advanced about 10 per cent., owing to the high price of the raw material.

Radiation.—The manufacturers of Radiators, on the 12th inst., announced an advance of 5 per cent. in the price of all Radiators.

House Heating Boilers.—An advance of 5 per cent. was made on the 9th inst. by the manufacturers of House Heating Boilers. The advance was rendered necessary by the condition of the iron market.

The United States Heater Company, Detroit, New York, Chicago and Philadelphia, under date of August 9, withdrew previous quotations on the Capital and Capital Mascot Boilers, and announced new discounts, showing an advance approximating 5 per cent.

Sad Irons.—The market on Sad Irons has been increasing in strength for some time past, owing to the advance in the price of iron and the heavy demand for the goods. Recently the manufacturers have advanced their prices 5 to 10 cents per set.

Washing Machines.—The high prices ruling for lumber and iron have caused an advance of 25 to 50 cents each to be made by the manufacturers in the price of Washing Machines.

Cadwallader Tin Plate & Metal Company, Pittsburgh, Pa., are sending out a card quoting special prices on the high grade Bright and Roofing Tin Plates of their manufacture. C. D. Rounds, Central Square, N. Y., is their New York representative.

Babbitt Metal, Solder, &c.—More-Jones Brass & Metal Company, St. Louis, Mo., issue a folder giving special quotations on Babbitt Metal, Solder and Metals, in which they call particular attention to the prices given on Solder.

Wire Nails.—Wire Nails from store are moving in fair quantities. Prices are well maintained. Small lots from store, New York, are quoted at \$2.25 to \$2.30 per keg.

Cut Nails.—The market continues unchanged, with a moderate demand. Iron Cut Nails are still scarce and command a premium over Steel. Small lots of Cut Nails from store, New York, rule at \$2.30 per keg.

Linseed Oil.—The demand for Linseed Oil in this market is confined to small lots. Prices are unchanged. City Raw in a retail way sells at 68 to 68½ cents per gallon.

Spirits Turpentine.—The demand for Turpentine has been larger during the week than for some time, owing to the low prices ruling. Stocks were materially reduced at this point, and a higher market resulted. Retail quotations are about ½ cent above last week's prices, at 47½ to 48 cents per gallon.

TRADE NOTES.

RAPID progress is being made in the erection of the new plant of the American Tube & Stamping Company at Bridgeport, Conn. The main building, which will contain the rolling mills and open hearth plant, will be 110 x 610 feet in area, and the machine shop 90 x 450 feet.

THE CLARK NOVELTY COMPANY, Rochester, N. Y., are sending out a little pamphlet devoted to Brass Faucets adapted for use on milk cans, cream separators, water coolers and oil tanks and for similar purposes. These Faucets, which are made in a variety of styles, are shown by means of wood cuts and half-tone engravings. Capping Steels for the use of canned goods packers and the Clark kerosene oil system of heating furnaces for tinsmiths and other mechanics are also shown.

It is announced that the Adamite Abrasive Company of Valparaiso, Ind., have bought a site at North Tonawanda, near Buffalo, N. Y., and will complete a factory there for the manufacture of Emery Wheels and other Emery Wares. They will import their ore from Austria. The plant will be operated by electricity from Niagara Falls.

THE WONDER WASHER & WRINGER COMPANY have been incorporated at Lewiston, Maine, with \$100,000 capital, to manufacture Washing and Wringing Machines invented by John R. Nye.

THE FRANKLIN SPECIALTY COMPANY, 627-631 Franklin street, Reading, Pa., are distributing through the mails an illustrated circular calling attention to their Nickel Plated Hammers, Hardware and Household Specialties. These include the Cracker Jack Hammer, the Korker Hammer, the Winner and Full Weight Hammers, the Imperial Roller Towel Rack, the Marvel Rotary Nutmeg Grater, the Clark Hatchet, the Royal Iron Stand, the Acme Pot Stand, the Dandy Ice Pick and the Perfection Clothes Line Hook. The company also announce that they are prepared to do any work in the line of nickel plating.

THE WALLACE MFG. COMPANY, Detroit, Mich., have secured permanent quarters at 21 Jefferson avenue and are now running full time turning out about 100 Hilliker Flame Bake Ovens and Steam Cookers per day. They announce that in a very short time they will begin the manufacture of a new patented Flue Thimble, and also from time to time they will place upon the market culinary articles made of sheet iron and steel.

UNDER date of 29th ult. the Kirk-Latty Mfg. Company, Cleveland, Ohio, announce that in connection with the manufacture of Bolts, Nuts, Rivets, Screws, Tacks, &c., they are now operating an Express Wagon department, and are in a position to accept orders for Boys' All Steel Express Wagons and Velocipedes, Toy Wheel Barrows, &c. The company intimate that they will make nothing in this line but the best.

H. W. JOHNS-MANVILLE COMPANY, 100 William street, New York, are sending out catalogues relating to Asbestos, Hair Insulator, Asbestos Roofings and Electrical Supplies.

THE AUBURN REDUCTION & SMELTING FURNACE COMPANY, Auburn, N. Y., have organized for the manufacture of Furnaces for smelting copper and other easily fused ores, under patents of Henry E. Vosburgh. The company will also operate a Brass foundry and mills for rolling Sheet Brass. The officers are Amasa J. Parker, president; Hon. A. P. Rich, vice-president; Alfred Fosgate, secretary; F. E. Parker, treasurer, and Henry E. Vosburgh, superintendent.

THE recent fire in the plant of the Charles Parker Company, Meriden, Conn., was confined to one of their small Brass foundries and did not inflict serious damage. Rebuilding is already under way.

ARTISTIC WOOD MANTELS, with Grates and Tiles in a wide variety, form the subject matter of a new catalogue issued by Edwin A. Jackson & Bro., 50 Beckman street, New York City. The catalogue contains some especially fine half-tone engravings, which display to the best advantage the handsome designs of Mantels that the company are now offering suitable for all classes of buildings. The concern are also manufacturers of a great variety of Grates, Andirons, Screens, &c., as well as a handsome line of Tiling for use in connection with their Mantels and Fire Places. The company's goods are provided with the Jackson Patent Ventilating Grate.

THE plant which the Thomas Devlin Mfg. Company, Philadelphia, Pa., are to erect at Burlington, N. J., will at first consist of a foundry building of about 38,000 square feet of floor space, core making building of about 8000 square feet of floor space, and annealing room, boiler and pump room of about 18,000 square feet of floor space. It is intended, however, to erect additional buildings next spring. The site contains 50 acres, with 2000 feet frontage on the Delaware River, and extends back to the Pennsylvania Railroad.

THE GRISWOLD MFG. COMPANY, Erie, Pa., recently purchased 6½ acres of land with two railway connections, on which they have erected a brick building, 230 x 50 feet, four floors, with basement, also separate brick buildings for japanning and tinning castings, &c. They are now removing all the finishing departments into these buildings, which will give them greatly increased capacity for turning out House Furnishing Goods, Hollow Ware and Gas Stoves. They will continue to run

their foundry in the old plant until next spring, when they will build a new foundry and the balance of the buildings necessary at the old plant.

THE WABASH SCREEN DOOR COMPANY, Chicago and Minneapolis, manufacturers of Screen Doors, Screen Windows and Stove Boards, are erecting a factory and warehouse at Minneapolis. The plant will comprise two brick buildings of modern mill construction, each building being 300 x 80 feet.

THE ENERGY ELEVATOR COMPANY, Philadelphia, Pa., are distributing an illustrated catalogue and price-list of their Hand Elevators and Dumb Waiters. The company confine themselves exclusively to the manufacture of these goods, including all attachments and appliances for the same.

A subscriber advises us that he has bound volumes of *The Metal Worker* for the years 1881 and 1889 inclusive, which he is willing to dispose of. If any of our readers are interested a letter of inquiry addressed to the Chicago office of *The Metal Worker*, 1205 Fisher Building, Chicago, will receive attention.

Must be sold at once. Reason for selling, am going into the manufacturing business in New York State.

Address "WALLACE,"
Care *The Metal Worker*, New York.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman streets, Pittsburgh, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building, 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburgh district with all machinery for making corrugated conductor pipe, eaves trough, ridge roll, &c. This is an opportunity to secure a bargain for one desiring a business that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, &c., please address

H. L. IRWIN,
Receiver for Marlin & Co., Inc., Pittsburgh, Pa.

Something New.

Just the thing for tinner, cornice makers and sheet metal workers. No long hours poring over old foggy text books or working deep mathematical problems, but a simple, practical course of instruction in sheet metal pattern cutting, taught by mail. Course of thirty-three lessons, including one hundred plates 13 x 18 inches, covering the subject completely, for the exceptionally low price of \$16.50. Write to day for full particulars and free sample plates.

THE HOME INDUSTRIAL SCHOOL, Canton, O.

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES,
DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-
book for tin-
ners and other
mechanics, treat-
ing simple prob-
lems in pattern
cutting, such as
are of daily occur-
rence in the shop.
An elementary
manual for the
young tinsmiths.
A handy reference
for all sheet metal
workers.

120 Pages
53 Figures

An Invaluable . . . \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by
means of illustrations and descriptive text,
about 50 examples of sheet metal pattern
work, such as the method of cutting can
breasts, flared tinware, scale scoops, oval
boiler covers, lips for measures, elbow pat-
terns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the require-
ments of the tinner, describing how to find
the area of a circle, the circumference of a
circle, the contents of a sphere, a cylinder,
a cone, and other information relating to
the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet
metals, including the weight of black sheet
iron, sheet lead, and galvanized iron sheets
with their dimensions; the weight of lead
pipe per foot; the weights of tin plates,
sheet copper and sheet zinc. Several pages
are devoted to tables giving the areas and
circumferences of circles, the capacity of
cans, the number of barrels in cisterns and
tanks, sizes of tinware in form of frustum
of a cone, &c., and practical receipts, in-
cluding mixtures for solders of different
kinds, soldering fluxes, and various ce-
ments.

TINNERS' HARDWARE ROOFERS' SUPPLIES.

We keep a complete line of **CAST LEADER SHOES AND SEWER CONNECTIONS** in stock for prompt shipment. Will be glad to submit prices on special sizes and designs.

We call your attention to our **Snow Shoe Irons.** They ought to be on every roof that has slant enough for snow and ice to slide off.

Have one for **Standing Seam Metal Roofs** and one for **Slate Roofs** Both can be used with or without wooden rail and are very ornamental as well as useful.

A large stock of **Ferrosteel Registers** always on hand. Let us quote you when you need any.

Spout Guards—all sizes and kinds—**Round and Square**, both of **Galvanized and Copper Wire.**

Solder in two grades—**Market half and half** and a better grade, **B. B. Solder.** Try a lot of it with your next order.

Galvanized Iron, Corrugated Iron Black Sheets, Sheet Zinc, Roofing Plates, Bright Plates, Roofing Papers and Paints, Tinnerns' Tools, etc. It will pay you to write for our prices. That's what we are here for.

**How
to
Make
the
Best
Roof**

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

**M F
Roofing Tin**

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tinnerns, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

With Lever Arc, Automatic Gauge. Will cut No. 21 iron
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

The worn-out argument against hot air furnaces, that they deliver a small quantity of over-heated, parched air, certainly does not apply to the Paragon Furnace. Everything about it is built to secure a very large quantity of moderately warm air. There are more square inches of radiating surface in a given size of the Paragon than in any other we recommend, and the Paragon is built for large sizes of cold air ducts, and if you build your leader pipes and wall flues of the right sizes that is what your customer gets.

A more healthful system of heating than the Paragon Hot Air system has never been devised.

## IF YOU HAD

all the furnace trade of your community you could throw worry to the four winds.

If you haven't this trade all to yourself, it behooves you to handle the Peck-Williamson Underfeed Furnace and get this trade. You can do it on two points—

On *bona fide* fuel saving every hour the winter through.

On more comfortable, healthy and uniform heat.

This is not a wild, brazen statement. We have the relentless proof back of every word. We might tell you here how our Underfeed Furnace consumes the coal as nature intended, without a wasteful draft through it; without spasmodic combustion; without allowing the heat to creep up through the chimney; without obliging you to open the door and lose good heat and smoke the basement when firing up.

The smoke that goes up the chimney is worth money. It is full of heat. It is heat that the ordinary furnace wastes. The Peck-Williamson Underfeed Furnace uses this heat. When the fresh coal is ignited the volatile gases, which in other furnaces escape as smoke, are burned in the Peck-Williamson Furnace. All the heat units are therefore utilized. What does this really mean? Think it over.

But we have a new and attractive booklet which gives all the facts and gives them so plainly and intelligently that no one can read it without understanding that the Peck-Williamson Underfeed Furnace will burn less fuel and radiate more heat and keep the house warmer than any other.

Our force of employes and sanitary engineers stand ready to aid you—to make plans and estimates—to bid on work through you—to write, if necessary, to your wavering customers—to work with you exactly as if you were one of our firm.

Somebody is going to sell this furnace in your community.

Would you feel easy if it were anybody else?

The Peck-Williamson Laundry Dryer banishes the bug-a-boo of washing day. Women want it.

### About Fire Pots.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

## WALKER & PRATT MFG. CO.,

31-35 UNION ST., BOSTON, MASS.

*Finest Factory in this Line in the World.*

*Prompt Deliveries.*

Made in 21 Sizes,

For Steam or Water.

**WE** believe a "DIGHTON" Furnace will do an equal amount of heating with less fuel than any other Furnace made.

There is no relation between its cost and its real value.

Some dealers estimate the worth of a Furnace on the price they may have paid for it; others base their estimate of worth upon results secured from actual service.

Any dealer who has ever compared results secured from other Furnaces with an equal number of DIGHTONS will recommend the "DIGHTON" as strongly as we do.

**DIGHTON FURNACE CO., Taunton, Mass.**

# GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

**R. J. Schwab & Sons Co.**  
**MILWAUKEE**

## There Has Never Been Any Doubt

as to the superiority of MOTT'S SUNRAY HEATERS. This great popularity isn't a matter of chance or luck; it is just simply the natural result of merit - of true worthiness. Then the price is right - no extra charge for the name. It will pay you to get our catalogue and discount sheet.

**AGENTS WANTED.**—Many a steamfitter has struck the keynote of success by handling our goods. We will grant agencies to established firms if territory is uncovered. Liberal inducements to the right parties.

**THE J. L. MOTT IRON WORKS,**

(Heating Dept.)

84-90 Beekman St., New York, N. Y.

## Brien Heater.

A perfect, all cast WOOD or COAL burner. There is no other Hot Air Furnace as low down as the "BRIEN."

DETROIT, MICH.

New York. Chicago. London.

# Have You Studied These Stoves?

IT WILL PAY YOU WELL

---

**GEORGE M. CLARK & COMPANY,**

73 LAKE STREET, CHICAGO.

**Dear Mr. Stove Dealer:**

The great **shortage** of **hard coal** means no hard coal stove trade this year. Oak stoves are dirty and are sold without profit.

## COLE'S ORIGINAL HOT BLAST

is the only stove in America that will burn soft coal in a cleanly manner and take the place of the base burner and give the dealer a fair profit.

Why not secure the exclusive agency for your town at once? We guarantee them to make \$2.00 soft coal equal \$8.00 hard coal; same even heat day and night; same cleanliness; fire never out; five sizes, from bed room to store heater; three grades.

We are the largest manufacturers in the United States.

Our prices are the lowest.

You cannot afford to fool with inferior imitations.

Write at once.

Yours truly,

**COLE MANUFACTURING CO.,**

**CHICAGO, - - ILL.**

**3218 to 3238**

**So. Western Ave.**

Shows No. 205, for coal. Saves escaping gases in soft and hard coal, wasted in other stoves. Will hold fire 36 hours on one hod of soft coal.

### TOO HOT FOR SPRING AND FALL - -

It is next to impossible to run your furnace so as not to get too much heat, in Spring and Fall.

Shows No. 745, for wood. Made in 5 sizes, 8 grades. They burn wood, cobs and trash. Even heat day and night. Fire not out during the entire winter. No danger of your plants' freezing. They cost no more than other stoves, and burn less fuel. Look out for imitations claimed to be just as good.

# GLENDALE

## Stoves and Ranges

MARSHALLTOWN, IOWA.

## INDEPENDENT STOVE PIPE RADIATORS.

Don't buy Radiators without learning about the Independent for 1902.

**Independent Register Co.,**  
CLEVELAND, O.

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

## IS IT SO?

It is said that a tea-kettle will boil quickest on top of a chimney. However that may be, all agree that there is too much heat wasted there. Nothing but the cross tube **ROCHESTER RADIATOR** has ever trapped it. If you were to heat a poker, would you hold it at the side of the flame or over the top? Or would you cook food on the side of a cook-stove in preference to the top? It is thus with the **ROCHESTER RADIATOR**, which takes the heat from the top of the current and not from the side. The cross tubes cool the hot current, just as you would blow across a cup of tea to cool it, only there are from 96 to 120 such currents in operation.

4,868 sq. ins.

# Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9 1/4 inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. Hot water circulation and hot water supply in buildings are treated at considerable length.

## PART OF CONTENTS:

### DANGEROUS BLUNDERS IN PLUMBING.

Running Vent-Pipe in Improper Places—Connecting Soil-Pipes with Chimney-Flues—By-Passes in Trap-Ventilation, etc.  
▲ Case of Reckless Botching.  
▲ Stupid Multiplication of Traps.

# Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

### BOILERS.

On blowing off and filling boilers.  
Where a test-gauge should be applied to a boiler.  
Domes on boilers; whether they are necessary or not.  
Expansion of water in boilers.  
Cast vs. wrought iron for nozzles and magazines of house-heating boilers.  
Pipe-connections to boilers.  
Passing boiler-pipes through walls; how to prevent breakage by settlement.  
Heating-boilers. (A problem.)  
Isolating-valve for steam-main of boilers.  
On the effect of oil in boilers.  
Proportions for rivets for boiler-plates.  
Iron rivets and steel boiler-plates.  
Is there any danger in using water continuously in boilers?  
A supposed case of charring wood by steam-pipes.  
Domestic boilers warmed by steam.

### VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.  
Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.  
Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.  
Calculating the amount of radiating-surface for a given room.  
How much heating-surface will a steam-pipe of given size supply?  
Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.  
Computing the cost of steam for warming.

### RADIATORS AND HEATERS.

Improper position of radiator-valves.  
Hot-water radiator for private houses.  
Remedying air-binding of box-coils.  
How to use a stove as a hot water heater.  
"Plane" vs. "Plain" as a term as applied to outside surface of radiators.  
Relative value of pipe on cast-iron heating surface.  
Relative value of pipe on steam-coils.  
Warming churches (plan of placing a coil in each pew).  
Warming churches.

### PIPE AND FITTING.

Steam-heating work—good and indifferent.  
Piping adjacent buildings: pumps vs. steam-traps.  
True diameters and weights of standard pipes.  
Expansion of pipes of various metals.  
Expansion of steam-pipes.  
Advantages claimed for overhead piping.  
Position of valves on steam-riser connection.  
Cause of noise in steam-pipes.  
One-pipe system of steam-heating.  
Air-binding in return steam-pipes.

How to heat several adjacent buildings with a single apparatus.  
Air-binding in return steam-pipes, and methods to overcome it.

### VENTILATION.

Size of registers to heat certain rooms.  
Determining the size of hot-air flues.  
Window ventilation.  
Removing vapor from dye-house.  
Calculating sizes of flues and registers.  
On methods of removing air from between ceiling and roof of a church.

### STEAM.

Economy of using exhaust steam for heating.  
Heat of steam for different conditions.  
Superheating steam by the use of coils.  
Effect of using a small pipe for exhaust steam heating.  
Explosion of a steam-table.

### CUTTING NIPPLES AND BENDING PIPES.

### RAISING WATER AUTOMATICALLY.

### MOISTURE ON WALLS, ETC.

### MISCELLANEOUS.

Heating water in large tanks.  
Heating water for large institutions and high city buildings.

Questions relating to water-tanks.  
On heating several buildings from one source.  
Coal-tar coating for water-pipe.  
Filters for feeding house boilers.  
Other means of clarifying water.  
Testing gas-pipes for leaks, and making pipe-joints.  
Differential rams for testing fittings and valves.  
Percentage of ashes in coal.  
Automatic pump-governor.  
Cast-iron safe for steam-radiators.  
Preventing fall of spray from steam-exhaust pipes.  
Heating and ventilation of a prison.  
Amount of heat due to condensation of water.  
Expansion-joints.  
Resetting of house-heating boilers—a possible saving of fuel.  
How to find the water-line of boilers and position of try-cocks.

### MISCELLANEOUS QUESTIONS.

Applying traps to gravity steam-apparatus.  
Connecting steam and return risers at their tops.  
Power used in running hydraulic elevators.  
On melting snow in the streets by steam.  
Arrangement of steam-coils for heating oil-stills.  
Converting a steam-apparatus into a hot-water apparatus and back again.  
Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

## Workmen's Organizations and Discipline in Hazardous Trades.

It is curious that the managers of labor unions have done so little in one direction in which there is room for much improvement. We do not recall a single instance of their using their power over their own men to enforce discipline in hazardous callings. The demand for adequate safeguards to protect the men against injury is always upon the employer, and he is relied upon to watch the conduct of the workmen and compel them to observe rules which are regarded as oppressive and are violated and evaded as often as possible whenever they are considered inconvenient. Individual men do protest to their fellows when the latter directly endanger their lives by recklessness or carelessness, but it is considered, apparently, a breach of honor to bring the matter to the attention of the management. We imagine that it is hopeless to expect workingmen to overcome that feeling, but it would seem that the organization of the men themselves, the shop or mill committee ought to take cognizance of the attitude of habitual offenders. The miner who tampers with his safety lamp deserves to be blown up, but unfortunately dozens and sometimes hundreds of his innocent fellows lose their lives and there is often very serious damage to the property of employers who are exhausting every known means to safeguard their men.

If there is any one matter in which employer and employee should co-operate heartily and loyally it is in the protection of life and limb. The great majority of employers and their works representatives are usually far more willing to provide the means and methods, but the men are only too often indifferent and hostile, and there are usually some of them who consider it a praiseworthy feat to circumvent those in authority by breaking or ignoring the rules which aim to guard them against injury. Discipline may be irksome, but in this respect it should have the backing of whatever organizations exist among the employees themselves, and if they do not exist they should be formed. It will probably be found in the majority of cases that if the rules framed by the employer are unreasonable modifications can be readily secured by well supported representations. The fools should be watched by all and be gotten rid of as soon as possible.

## Trade Protection.

It is naturally exasperating to those who are active in efforts for the betterment of conditions in their trade that others who contribute nothing to the effort should not

only share in the benefits but also increase the labors of the associations. This feeling has led to some unfortunate contentions among the plumbers in different cities, and the retaliatory methods employed have developed some strife, if not actual warfare. It is unfortunate that those who are most interested are so occupied with their regular business and with aggressive and defensive measures that they are not prepared to take a more philosophic view of the situation and expend their energy on different methods of accomplishing the same result. Such a change would lead to more harmonious relations and remove some bitterness which assuredly does not add to the comfort of any concerned. In another column we present the expressed views of the steam fitters on a question of vital importance to them and one which is worthy of consideration by the manufacturers of heating apparatus. Like all other questions, it has two sides. It is possible that the manufacturer may incline to the opinion that the canvass which he is paying his men to make increases the business for the steam fitter and is therefore entitled to some consideration. On the other hand, the steam fitter feels that in maintaining an establishment continually at the disposal of the public he also is exploiting the field. In the past a satisfactory agreement was reached which enabled the manufacturer to extend the sale of his boilers without interfering with those steam fitters who required no assistance. It is contended that, in some instances, a doubtful benefit has been secured by the tradesmen who have been induced to take up steam and hot water heating and install a plant on the plans designed by the manufacturers' salesmen and based on the estimate of cost which he has prepared. This doubtful benefit, unfortunately, extends to the competent steam fitter, inasmuch as it makes a price that is too low for doing work, and which has, moreover, an influence on all the work in the community. Now that the feelings of the steam fitters have been given expression, it is well for them to receive the consideration to which they are entitled. As the business world was never more careful than at present to give favorable consideration to reasonable objections made to prevailing customs, it is probable that no great friction will be developed in this particular branch of trade. It is to be hoped that the few contentions which exist in the plumbing trade may be as readily disposed of.

## Manufacturers and the Export Trade.

It is to foreign markets that American manufacturers turn as an outlet for their surplus productions in times of depression or dullness in the domestic trade. In this present period of "boom" conditions, when high prices are obtainable at home, a tendency exists to neglect the export business and cater solely to domestic customers. This is an unwise proceeding, for the time must inevitably arrive, sooner or later, when the swing back of the pendulum will bring down both prices and the volume of business. Then the foreign markets will again become objects of interest and attention. But if their cultivation has been neglected in the interval the fruit will not be so easily plucked. Eras of lower prices in the United States are obviously coincident with eras of expansion of the export trade. We had such an era

before the last wave of prosperity arrived. When we get in the trough of the commercial sea again the export trade will not only resume, but greatly increase its importance. It will also prevent what used to happen at the time of a depression, and it behooves manufacturers to keep the strongest possible grip on it and not be tempted by big domestic prices into entirely letting it go for the time. It is a wise precaution to hold what good trade they have even at the expense of some profit. Then they can expand it when the home market fails them, aided greatly by the fact that they have kept the trade alive by furnishing partial quantities, if unable to fully execute all orders.

### The Demand for Bright Young Men.

The activity manifested in all branches of manufacturing business and among mechanical tradesmen is such as to require the utmost efforts of all the talent already available in established business concerns. The readers of *The Metal Worker* are more particularly interested in the demand for young men of good education and thorough training in special branches of engineering. The demand is greater than ever before for high class pattern cutters, who may never be called upon to handle the mallet and shears, but who can take the architect's drawings, work out the design and draw the patterns for the work. In the plumbing trade there is opportunity for young men who have made a study of the engineering side of this trade and are masters of the principles and details involved in the installation of modern and high class plumbing systems. These men are needed both for superintending the installation of such work and for meeting architects and builders from whom work is solicited, as well as for preparing the estimates and plans of the work to be installed. In the heating trade, whether in the furnace, steam or ventilating branches, men who have made a study of this science and are capable of figuring the requirements of any class of building and of designing the apparatus needed in it, and who are also capable not only of superintending the installation of the plants, but also of meeting those who have need of such work and securing their orders through thorough explanation of the requirements, are being sought after in all of the large business centers. The opportunities offered to young men at the present time far surpass those that were open a quarter of a century ago. To-day, through the agency of correspondence schools, a young man may take up any branch of trade and systematically and thoroughly master it by mail, whether he be located in a large center, where public libraries are available to him, or in the most remote rural district. Those who are more fortunate and can attend one of the schools of technology naturally enjoy better facilities for qualifying themselves for the work that they may select. It is well for the young man to learn early that it is not enough to be able to do the work, but that his success in life depends on a thorough understanding of the basis on which each part is designed and proportioned. Any work that may come under his notice should receive his careful attention and analysis, so that it can readily be called to mind and the experience be utilized in the designing of similar work. Technical training and knowledge consists in the systematic arrangement of varied experience so that it can be readily referred to. The young man who cultivates a retentive mind, who is a persistent seeker after the cause for every effect and a student of the text books and available literature on the branch in which he is most interested, is preparing in a manner which will lead to certain

success in obtaining a position that will be profitable and useful, whether in the management of his own business or in the employ of some already established business concern.

### Phase of Western Building Situation.

One phase of the building situation as it has prevailed, particularly in the West, is worthy of note, and it has never been more remarkable than during the present season—that is, the weather. Rarely, if ever, has the contractor been compelled to submit to such unfavorable conditions as have prevailed throughout the present season and in all sections of the country, says a writer in *Construction News*. Truly the elements have been against him. Work that was put in early in the season upon the most carefully calculated plans fell down on account of the heavy fall of rain, not only to the embarrassment of the man who designed it but to the cost of the owner and contractor, none of whom were to blame. Instances of this sort multiplied all over the country to such an extent that the aggregate of loss must by this time be considerable. Not so expensive from the contractor's standpoint, but more so from that of the owner, have been the temporary delays in the beginning of work, but it is to be hoped that the end of the unpleasant weather has been reached and that henceforth the path will be clear of such obstructions.

Charles D. Walcott, director of the United States Geological Survey, has issued the annual mineral chart showing the mineral products of the United States from 1892 to 1901 inclusive. This chart is issued in addition to the "Report on the Mineral Resources of the United States, 1901," which will be ready for distribution in the fall. The statistical summary of the mineral products of the country for the calendar year 1901 shows, for the entire country, a grand total of \$1,092,224,380 as the value of minerals produced in 1901, as against \$1,064,408,321 in 1900. This comprises \$566,351,000 worth of nonmetallic mineral products and \$525,873,280 of metallic products. The value of pig iron is placed at \$242,174,000, copper at \$86,629,266, lead at \$23,280,200, zinc at \$11,265,760 and aluminum at \$12,238,000. The value of bituminous coal mined in 1901 is placed at \$236,201,899, anthracite coal at \$112,504,020, petroleum at \$66,417,335 and natural gas at \$27,067,500. The total value of the mineral products of the United States has increased from \$369,319,000 in the calendar year 1880 to nearly \$1,100,000,000 in 1901. The increase has been steadily progressing throughout the 21 years intervening between those dates.

The municipal authorities of San Francisco, Cal., are again agitating the question of limiting the height of tall buildings. At present there is an ordinance of the Board of Supervisors which limits the height of Class A buildings on streets 100 feet in width to 125 feet. The height of Class B buildings on all streets is limited to 80 feet and of Class C buildings to 75 feet. It is now proposed to increase the limit from 125 to 130 feet on streets 100 feet or more in width, and to allow a height of 95 feet on all streets less than 100 feet in width.

The increasing use of oil for fuel on the Pacific Coast is having a depressing effect on the coal trade of British Columbia. A press dispatch from Vancouver reports the closing of important mines at Nanaimo, the men being advised to look for employment elsewhere. Vessels long engaged in transporting coal to San Francisco have been laid off.

United States Consul-General Robert P. Skinner of Marseilles, France, reports that the National Colonial Institute in that city has received notice that important deposits of mica have recently been discovered in French Guinea. Samples of this mica, which are at the Colonial Museum, are said to show that the material is of first-class quality.

## The Pig Iron Situation.

We have been asked by so many stove manufacturers for our opinion as to whether this is a good time to buy iron or not, that we have come to the conclusion to answer such inquiries in the form of a statement of existing conditions and influences. They may then draw their own inferences and use their own judgment. Transactions in foundry pig iron have been unusually heavy for some considerable time, and large contracts are known to have been placed for the delivery of pig iron extending through the first half of 1903. These contracts have been made mainly by heavy consumers of pig iron who are in the habit of covering their estimated requirements for a considerable time ahead. This is their practice whether the market is advancing or declining. They are compelled by the peculiar conditions of their business to provide a definite supply on which they can rely, but it is probable that they have bought more heavily at this juncture than usual, partly because pig iron has for some time been quite scarce and partly because the outlook is so favorable for general business. The rank and file of the foundry trade do not ordinarily make purchases covering their necessities so far in the future. They are apt, however, to follow the example set by the heavy consumers and in times of scarcity or advancing prices they will also make purchases for extended deliveries. The transactions of the past few weeks have undoubtedly included many contracts made by the smaller foundrymen. It is understood that quite a number of the leading stove manufacturers have been among those who have placed long time contracts. The persistent announcement that furnace after furnace has thus disposed of its product for several months in 1903 may well make those foundrymen do a little hard thinking who have not yet bought any iron for next year.

For the purpose of correctly understanding existing conditions in the pig iron trade, it will be well to inquire into the cause of the present great scarcity of foundry pig iron. This scarcity is primarily due to the strikes of coal miners in the anthracite region of Pennsylvania and in quite a number of bituminous districts in some portions of Pennsylvania, West Virginia, Virginia and further South. While the quantity of pig iron produced with anthracite as a fuel is not very heavy, yet nearly all of the iron so produced is of foundry grade and its restriction thus directly affects foundrymen. The strikes of bituminous coal miners have to quite an extent interfered with the production of coke. It happens, therefore, that even if all the furnaces using anthracite had been able at once to turn to coke as a substitute the coke necessary for this purpose was not available. The diversion of anthracite users to coke came at a time when the coke production, instead of being increased to meet this demand, was being restricted by the bituminous miners' strikes. In addition to the trouble caused by miners' strikes, the movement of coke from the great Connellsville coke region has been seriously handicapped by the shortage of cars and motive power. It is estimated by *The Iron Age* that the troubles due to the coal miners' strikes in the North and South caused a falling off in July of fully 75,000 tons from the normal output of pig iron, nearly all of which fell upon the foundry branch of the industry. The deficiency in the domestic supply of foundry pig iron has to a considerable extent been met by the importation of pig iron. The importations are now running up to quite a figure and in some localities along the Atlantic Coast Scotch, English and German pig iron have established the price for quick shipment and ruled the market. In the meantime the consumption of pig iron has continued on a tremendous scale. The quantity of iron melted in this country is in excess of anything ever known, and the very prosperous condition of the country seems to warrant the belief that this consumption will continue indefinitely. The steel trade is so active that it has to some extent encroached on the furnace capacity which, in ordinary times, would be available for the requirements of the foundry trade. This is observed in some sections of the North and to quite an extent in the

South, where furnaces are now producing basic iron for steel making purposes, which ordinarily would be run on foundry iron. The restriction of output caused by the scarcity of furnace fuel, together with the heavy consumption, has caused a sharp premium to be paid on foundry pig iron for delivery during the remaining months of this year. The contracts being placed for next year are being made at figures which seem reasonable compared with the premium pig iron, but at the same time they are very considerably higher than those prevailing at the opening of the present year. Those who are placing contracts are therefore putting themselves in a position to greatly increase their manufacturing costs. This is what impels numerous foundrymen to hesitate before taking steps to contract for such iron as they may need during the opening months of next year.

The consumer of pig iron who has these facts in mind and is confronted with the desirability of determining what to do has several points to consider. One of these is that the cause which has contributed so greatly to the scarcity of foundry pig iron is not of a permanent character, but is at any day likely to change into an influence having the opposite result. The strike of the anthracite coal miners, having continued for three and a half months, can certainly not be expected to run much longer. The bituminous miners' strikes are gradually coming to an end. As soon as announcement is made that these strikes are settled, or that all coal operators have actively resumed the mining of coal, a feeling of relief will spread through the trade and consumers of iron will anticipate a more abundant supply. Sentiment governs the feelings of business men just as it governs mankind generally. It will not be necessary to see shipments of pig iron immediately increasing, but those who have been fearing still greater scarcity will cease to be apprehensive and those who have been endeavoring to increase their supply will no longer be so ardent in pursuit of iron. With a slackening in the sharp inquiry will come a condition of more ease in the iron market. If, at the same time, the importations continue in as large a volume as recently, the supply will probably soon be found adequate to all the requirements of the foundry trade. Another influence which must be borne in mind is the fact that during periods of scarcity like the present consumers seek a supply in various directions. Their inquiries are not confined to one commission house or furnace company, but extend to a number of them. If a furnace company should fail to deliver iron contracted for, and purchases are made elsewhere, the original company will still be held to the contract to furnish the iron, and these contracts form a reserve in the supply to be drawn upon after conditions relax and the production of pig iron is proceeding on a normal basis. Consumers of pig iron, therefore, who have contracts at low prices on which they are receiving no iron will confidently expect to secure shipments on such contracts after the miners' strikes are over and the iron trade is again in a normal condition.

It has been assumed by many individuals that such important additions to furnace capacity are now in progress that at an early day a much more plentiful supply of foundry pig iron will be available. The relief from this source will not be so great as supposed. By far the larger part of the new furnace capacity coming in will be for steel making pig. The new capacity which will be available for foundry pig iron is comparatively small. Should the steel trade slacken, some of the furnace capacity now given over to basic pig iron will be diverted to the foundry trade. But the great hope of the country, so far as foundrymen are concerned, is in a speedy end of troubles among the coal miners and a resumption of full activity by the furnaces devoted especially to the foundry trade.

A. W. WAGNER, Chicago manager for Stowell Mfg. & Foundry Company, South Milwaukee, Wis., has resigned, his resignation taking effect Aug. 12. Mr. Wagner is making arrangements to enter the manufacturing field and will shortly issue an announcement to the trade outlining his plans.

## NOMINATIONS FOR STOVE CAPTAINS.

Evidently the suggestion made by a correspondent in *The Metal Worker* of August 16 has attracted some attention. That interest is taken in the idea by the stove trade is testified by the following communication from a stove manufacturer who has been identified with the trade for more than a quarter of a century:

I noticed in *The Metal Worker* of August 16 an article under the heading, "Again the Stove Captain." There are several men in the stove business who could successfully manage a stove combine. G. B. Gunderson of the Detroit Stove Works has surely demonstrated his ability in bringing to the front the concern which he manages financially. George H. Barbour of the Michigan Stove Company, or J. W. Van Cleave of the Buck Stove & Range Company, would make first-class captains. Either of these stove men has the ability to map out a plan which would make a stove combine a great success.

## STOVES, FUEL AND CAPTAINS.

BY M. D.

Your recent editorial on "Stoves and Fuel" does not give as much consideration to one character of fuel as it is entitled to receive, and I would call your attention to natural gas. The daily papers have recently given accounts of a movement among the companies controlling natural gas fields in the Central West to combine in one large company for the purpose of making the natural gas fuel available for domestic purposes in cities where heretofore it has been popular and where the supply has either failed or become unsatisfactory through being intermittent in service.

There can be no doubt that the use of natural gas in hot air furnaces has increased their capacity through the evenness of the temperature. The question comes up, however, what about the cost of gas fuel used in coal burning apparatus? Are they not far heavier than is necessary and, consequently, is not much fuel wasted when used in them? In the vicinity of Pittsburgh coal burning ranges and furnaces of the cast iron type are being displaced to a certain extent by sheet metal constructions for burning gases. One concern claim to have sold over 2000 gas ranges of a single pattern of steel construction in the vicinity of Pittsburgh, and another concern report a continually increasing business. The coal strikes and the convenience of the gas fuel, notwithstanding that the supply has fallen off in some districts, have given the general public a taste of the convenience of such fuel and has made the opportunity for the exploiting of something less laborious and dirty in its use than the universal coal fuel.

On considering this there comes up in my mind the possible effect on the general stove and furnace business. I firmly believe that oil and fuel gas are rapidly coming to the front, and that the foundry made stoves will suffer in the East as well as in the West from the competition with sheet metal constructed gas stoves and heaters. If my calculations are correct, the discussion in reference to a "stove captain" would seem to indicate that he is necessary for the general good of the stove and foundry interest. A man who could execute a flank movement and get a good share of the sheet metal trade for his combination would be a worthy captain. If such a man should be found and chosen for the work, I would be glad to submit a plan for his consideration.

## THE PENINSULAR SLACK BURNERS.

Owing to the scarcity of anthracite coal, a wider interest in the retort Peninsulars, manufactured by the Peninsular Stove Company of Detroit, Chicago and New York, will be taken by the trade. These stoves are designed to be smoke consuming, having a hot blast tube down the center. They are adapted for burning hard or any grade of soft coal and can be used for burning wood. The broken view, Fig. 1, shows the Retort Pen-

insular, which resembles the popular oak stove in appearance. The castings are of suitable design and the appearance is improved by the use of nickel ash hearth, a nickel foot rail, a combination panel and tea pot stand, a top ring and a top ornament. At the top of the stove

*The Peninsular Slack Burners.—Fig. 1.—Broken View, Showing Construction of Retort Peninsular.*

is a combination swing and lift feed door, large enough to permit the entrance of large lumps of coal and knotty chunks of wood. At one side of the stove is a damper for regulating the amount of air which is brought to the surface of the fire by means of the hot blast tube by

*Fig. 2.—Broken View of Parlor Peninsular.*

supplying the combustion chamber with a continuous current of heated air, so that both the gases and the free carbon rising from the heated fuel are consumed without the production of smoke and with the effect of a substantial economy and increase in heating capacity. The fire is carried in a heavy cast iron fire pot.

made double to allow for expansion and contraction, the upper section being composed of steel to protect the outer body of polished steel from the effect of the intense heat.

This polished steel affords a pleasing contrast with the castings and is said to require no blacking. The angle of the fire pot and the deflecting ring at the top both have the effect of throwing the radiant heat down upon the floor, insuring strong heating power where it is most needed.

The Parlor Peninsular, shown in Fig. 2, is of a handsome finish, owing to the fire pot being concealed within the polished steel body. The grate is supported on substantial standards and is not likely to warp. The fire pot is heavy, made in sections and arranged to thoroughly protect the outer body. The ash pit has a large swing door fitted with an air tight draft register. This stove is also provided with a large feed door and with a damper arrangement at the top to regulate the air supply to the hot blast. Another feature is the use of flanges at both the top and the bottom to secure an air tight construction, so that the combustion can be perfectly controlled.

The stove shown in Fig. 1 is made in five sizes, having fire pots 12, 14, 16, 18 and 20 inches in diameter, while the stove shown in Fig. 2 is made in three sizes with fire pots 12½, 14½ and 17 inches in diameter. The company issue a four-page circular fully describing the features and details of these stoves.

### Charter Oak Stoves and Ranges.

We have received from the Charter Oak Stove & Range Company of St. Louis, Mo., a copy of their new catalogue of stoves, ranges and heaters, covering the season of 1902-1903. It is an attractive volume of 188 pages, printed on paper of a delicate shade of pink, which forms a striking contrast with the well executed engravings in black which are employed throughout the work. The binding is in flexible covers of a neat floral design, in connection with which appears the name and address of the company, together with a *fac-simile* of their trade-mark. The frontispiece is a bird's eye view of the company's works, which cover more than two city blocks, or an area of over 5½ acres, and give employment to over 500 men. Among the opening pages is an index alphabetically arranged, a statement of terms, discounts, &c., and an enumeration of some of the strong points and advantages of the company's steel ranges. These cover the construction and material of the body of the stove, the oven, the fire box, the damper, the grate, the pouch feed and the key plate top.

The leading place in the catalogue is given to the Grand Charter Oak, a cast range for using soft or hard coal and also made for burning wood as a fuel. The company make a line of cook stoves under the same name, several of the varieties being presented. The Charter Oak, the New Glory, the Beauty and the Bright steel ranges are next in order, the last two having an aluminum finish. Steel cook stoves are then considered, these in turn being followed by an extensive assortment of cast goods. Special attention is given to a varied line of hotel ranges and stoves constructed of wrought steel, also steam tables, charcoal broilers, hotel laundry stoves, carving tables, sand ovens, &c. The cook stoves and ranges occupy more than 100 pages of the volume, the latter half being devoted to heating stoves, of which the Royal Charter Oak base burner for hard coal occupies the leading place. This is made in three sizes and is ornamented in a rich and effective manner, nickel playing an important part in the decoration. Another handsome construction is the Charter Oak air tight heater for soft coal, made in three sizes. The fire pot and dome are solid castings, extra heavy, firmly bolted together and surrounded by an ornamental open casing making the stove equal to a small furnace. Important features of the construction are shown by means of separate engravings.

An extensive line of oak, globe, cannon, todd, box, laundry and air tight stoves are also illustrated and

described. The closing pages are given up to Charter oak furnaces, farmers' boilers, grates, stove hollow ware and miscellaneous goods.

### THE IDEAL WARM AIR REGISTER.

A warm air register which is made exclusively for the side walls of rooms is being introduced to the trade by the Ideal Register Company, 129 and 131 West Woodbridge street, Detroit, Mich., under the name Ideal. It is ornamental in character, is referred to as being fire proof, is so constructed that it will not at once become discolored by use, has an adjustable valve, and the register can be used in any width partition. This is especially desirable when it is necessary to place a register in a partition used for sliding doors. The working parts are made of cold rolled steel, stamped, and are claimed to be unbreakable. The border, or wall frame, is dust tight and the register can be placed after the carpenter work is finished, thus avoiding the neces-

*The Ideal Warm Air Register.*

sity of waiting for other workmen. Two registers may be placed opposite in a partition and the arrangement is such that the base board abuts the wall frames. In the accompanying illustration we show the register in position and fully open. It will be seen that the grille surface admits of a large increase of warm air, while the register fully protects the wall from discoloration by providing an ornamental shield, which deflects the current of air out into the room. The shield, or deflector, can be closed when desired, thus protecting the ornamental grille and preventing dust from settling in the register box. It can be closed to any degree required and is practically noiseless. In order to open the register the grille work moves outward from the top and the valve moves inward from the bottom, dividing the air in the wall pipe at any degree desired. The register can be used as a convenient foot rest, and when such use is made of it a small catch at the top of the register prevents its closing. The company point out that this register deflects the air easily, has no parts to become worn out or to get out of order, and that it is more quickly and easily fastened to the wall than registers as ordinarily constructed. The second floor registers carry out the same general effect in design, without interfering with the second floor pipe.

C. C. HEATH & Co., Philadelphia and Baltimore, have taken the sole sales distributing agency for the entire output of the Raymond Mfg. Company of Middletown, Pa., comprising, among other goods, the Grand Perfect line of Ranges, Grand Susquehanna Cooks, Art Perfect Heaters, Conqueror Furnaces and their entire line of Stove Repairs.

## EASTERN HOUSEHOLDERS AND SOFT COAL.

The prolongation of the strike of the anthracite coal miners far beyond the anticipation of the public is causing much anxiety among Eastern householders, who fear they may be compelled by the scarcity or high price of anthracite to use bituminous coal. Officials of the anthracite mining companies are endeavoring to allay apprehension by assurances that the strike will end ere long and that the regular prices will prevail as soon as coal begins to be rushed to market.

This is welcome news, but meanwhile the strike goes on and householders are making inquiries about soft coal. The *New York Herald* for August 20 published an interesting article on the coal situation in which this phase of it was discussed. William Corry, manager of the Stove Manufacturers' Repair Association, 230 Water street, New York, was among those interviewed, and his remarks are quoted as follows:

Few flues and chimneys are constructed for the use of soft coal, but householders may be able to use it with some discomfort. There will be little or no trouble with the grates; but, to use soft coal, chimneys should be roomy to accommodate the larger volume of smoke, and the flues larger than for anthracite. Out West the stoves are specially constructed for both kinds of coal.

There will be trying times in thousands of houses when attempts are made next month to heat and cook with soft coal. Flues will speedily clog and the smoke will spread back into the rooms. Furnaces downstairs will use the stairways for chimneys and the servants will find it impossible to keep fires overnight.

Poor people will have to get along with soft coal if the present high prices continue, but I would advise those who can afford it to try no experiments and pay the price for anthracite, no matter what it may be.

## Superior Stoves and Heaters.

The 136-page catalogue which has just been issued by the Bridge & Beach Mfg. Company, South First street, St. Louis, Mo., marks the sixty-sixth year of their continued success in the manufacture of stoves, ranges and heaters. The volume is neatly printed upon a good quality of paper, is profusely illustrated with well executed engravings, some of which are half-tone reproductions from photographs of the finished goods, and the binding is in flexible covers with embossed side title. A double page illustration of the company's foundry, offices and salesroom, together with general views of of their offices and warehouses in San Francisco, Portland, Denver, Spokane and Los Angeles, constitute features of the opening pages.

The goods illustrated and described are offered under the generic name Superior and embody features which cannot fail to command the attention of the trade. The Superior steel range is first considered, this being shown in japan finish and also in aluminum finish, the latter giving very rich effects. The Mohawk steel range, intended for using coal or wood, is offered in a number of styles and sizes, after which is the Superior steel cook, embodying the modern improvements. An extensive line of cast cook stoves and ranges are then considered, these occupying nearly 90 pages of the catalogue. Among the heaters attention is first invited to the Superior radiator, which is shown in regular finish and also in what the makers designate as "high finish," the latter involving a more elaborate use of nickel. The Superior hot blast, with exposed fire pot, is another pattern likely to interest the trade, embodying as it does many taking features. Cheaper lines of heaters occupy the closing pages, together with suggestions about operating stoves, ordering repairs, &c. Not the least important feature is a code index, alphabetically arranged; also a general index, in which the kinds of stoves, ranges and heaters are classified.

THE Stove dealers of Terre Haute, Ind., have recently been complaining that Township Trustee Fisbeck has been buying Stoves outside of the city without asking for bids from the home dealers. In defense of his position Mr. Fisbeck states that he desired a special make of Stoves which the home dealers did not handle, but they in turn fail to understand why he did not ask them about it before buying elsewhere.

## ODD PLATES.

THE CHAMPION OIL BURNER COMPANY, 63 Mueller avenue, Cleveland, Ohio, are sending to the trade circulars explaining the use and application of their Champion Oil Burner, which is designed for use in the fire chambers of cooking stoves and ranges. This Burner is arranged to be supplied by gravity with oil from a tank set about 2 feet above the stove. The Burner is of a size and shape that it can be readily placed in the fire chamber of the stove, and the heat generated is sufficient not only to heat the water in a water back or in a reservoir at the back of the Stove but to do the cooking on the top of the stove and also for baking. This Burner, which has been on the market for some time, is made in several sizes for cooking stoves and also for hot air furnaces. The oil on entering the Burner comes in contact with a hot generator, transforming it into a gas which burns at a very intense heat. It is claimed that its operation and care are so simple that the ordinary house servants can use it with safety and satisfaction.

DOE-WAH-JACK, the Indian who presides over the destinies of the Round Oak Stoves manufactured by the Estate of P. D. Beckwith, Dowagiac, Mich., was a conspicuous figure at the convention of the Michigan Retail Hardware Dealers' Association in Detroit last week, and he held a reception in one of the private parlors of the Cadillac Hotel. In his wigwam was smoked the pipe of peace and all braves of visiting tribes were presented with a souvenir match box, one side of which was adorned with the chief's picture and the other with an illustration of the Round Oak Stoves. J. O. Becraft and W. T. Leckie stood sponsors for Doe-Wah-Jack. A huge bouquet on the desk of the presiding officer bore testimony to their thoughtfulness.

THE TUTTLE-ALLEN STOVE COMPANY have decided to remove their plant from St. Joseph to Kansas City, Mo., a lease having been taken of the premises at 305 Delaware street. The concern are incorporated under the laws of the State of Missouri for the manufacture of Steel Ranges and Cook Stoves. W. F. Allen of Superior, Neb., is the president, and F. C. Tuttle is secretary and treasurer. For 19 years the latter was with the Great Western Stove Company of Leavenworth, Kans., and two years ago he took the management of the Western branch of the H. Wetter Mfg. Company, at St. Joseph, Mo., afterward organizing the Tuttle-Allen Stove Company.

THE WEIR STOVE COMPANY, Weir, Mass., resumed operations in their molding department on Thursday, August 14, and in their mounting shops on the following day.

THE BAXTER STOVE COMPANY, Mansfield, Ohio, closed their works August 11 in honor of the opening of the carnival of the Knights of Pythias in that place.

THE CORNING STOVE WORKS, Corning, N. Y., resumed operations August 11 after a brief shut down.

WE understand that the Western branch of the H. Wetter Mfg. Company is about to be moved from St. Joseph to Kansas City, Mo.

THE INDEPENDENT REGISTER COMPANY, Cleveland, Ohio, in a little pamphlet which they have issued, tell how to heat a room without cost for fuel. They point out that this is accomplished by the use of their Independent Stove Pipe Radiator, which is used as a substitute for a section of stove pipe. The device can be used in a variety of ways, and by means of it much of the heat which usually escapes through the chimney is utilized. One form of Radiator is intended for use in connection with any fuel, except soft coal, while another is designed especially for soft coal.

A. T. NYE & SON COMPANY of Marietta, Ohio, manufacturers of the Royal Leader Stoves and Ranges, report that they are extremely busy making fall shipments. In addition to the extensive improvements made in their plant last year they are now adding a new power house and installing a 100-horse-power boiler and a new electric generator for lighting their plant.

THE MICHIGAN STOVE COMPANY are furnishing customers handling their goods with water proof Garland

signs. They consist of cards measuring about 10 inches square and upon them, printed in colors, is the Garland trade-mark. These signs are intended to be tacked on telegraph poles, fences or other outdoor places where they will be conspicuous.

THE SHELBY STOVE COMPANY, Shelby, Ohio, are remodeling and enlarging their plant in order to keep up with the demands of their rapidly growing trade. We understand that a number of new buildings will be constructed and the force of hands will be increased by 75 to 100 men. New machinery is being installed and the work is being pushed as rapidly as possible. It is hoped that the plant will be running full capacity in the course of a few weeks.

WE have received from F. D. Woodruff, 142 Michigan street, Chicago, illustrated circulars descriptive of a Heater which he has just brought out. The Heater is named the Grate-Spiral, and has a number of interesting features.

THE MARCH-BROWNBAC COMPANY, Pottstown, Pa., are reaping the benefit of the interest that their new construction, the Crown Low Down Hot Air Furnace, is creating among the heating trade.

OWING to the coal question, increased interest will be taken in the Bay State Wood Furnace made by the Barstow Stove Company, Providence, R. I., which is well adapted for burning trash wood or other available fuel.

IN another column a view is presented of the plant where the Acme Oven Thermometers are made by the Evans Stamping & Plating Company, Taunton, Mass., which gives evidence of their facilities to supply all orders promptly.

THE SMITH & ANTHONY COMPANY, Boston, Mass., are bringing to the attention of the trade the Monarch Hub Range, specially adapted for bulldozers' use.

THE success that has attended the use of the Cole Air Tight Heaters for wood, made by the Cole Mfg. Company, Chicago, Ill., is assured in Cole's Original Hot Blast for burning all grades of soft coal, and which is already in demand where hard coal is scarce and high.

GEORGE H. BARBOUR, vice-president and general manager of the Michigan Stove Company, Detroit, is enjoying a brief vacation at Watch Hill, R. I., preparatory to the active work of the fall campaign.

A BLOTTER sent to the Gas Stove trade by the H. Adler Company, Pittsburgh, Pa., refers to the old foggy way of making Gas Stoves in a pleasant manner that will be sure to attract attention to their Acme and Iona line of Gas Goods and secure applications for their catalogue 36 devoted to them.

THE ROYAL LEADER, which is made by the A. T. Nye & Son Company of Marietta, Ohio, is offered with and without reservoir, and in either Range or Cook Stove form as may be desired. It has four boiler holes in the top surface and is ornamented in a neat and effective manner. The manufacturers state that the 100 per cent. increase in their business is ample evidence of the fact that their goods are meeting with success.

THE GRAFF FURNACE COMPANY, 208 Water street, New York City, in referring to the merits of their Hero Furnace, claim that it is so constructed as to do the work required of it in an economical manner; that it is durable and that the satisfaction which it is and has been giving makes friends for them. The catalogue which the company have issued sets forth the merits of their Furnace, and gives an idea of the varied line they manufacture.

THE Tremont Hot Blast Oak Stove is referred to by the Pittsburgh Stove & Range Company of Pittsburgh, Pa., as a successful soft coal self feeder which will burn anything. It is offered as a surface burner, or as a self feeder, as well as a single or double heater. The magazine for soft coal has a force feed, and while the fire supplies the power the shape of the magazine applies it. The company refer to the Stove as being "neither a freak nor a suspicious character;" that it has seven years of phenomenal success to its credit and is sold with the guarantee of their name and the mark of public approval. The Stove is simple in its construction,

having no complex mechanism, and the company claim that anybody who can cut kindling wood, strike a match and lift a coal hod, can run it.

THE AMERICAN FURNACE COMPANY, 1911 and 1913 Pine street, St. Louis, Mo., state that whereas they formerly lined the fire pot of their American Furnace with cast iron, which cracked and warped, they now use fire brick and will guarantee it for five years. The Furnace is made strong in places where experience has shown other heaters to have proven weak, and it will burn any kind of fuel. It is made of heavy steel and riveted tight like a boiler. The large radiators are easy to clean, and the fire brick lining of the fire pot can be replaced through the fire door.

THE FOREST CITY FOUNDRY & MFG. COMPANY, Cleveland, Ohio, call attention to the Monarch Air Blast Furnace, which they are offering and which embodies features of construction likely to interest the trade. The catalogue for 1902 sets forth the merits of their goods.

THE JOLIET STOVE WORKS, Joliet, Ill., have made a practice of furnishing dealers handling their goods with an attractive sign intended to project over the sidewalk and sustained by an ornamental iron bracket. The inscription upon the sign tells that "The Original Air Tight Heater Will Keep You Warm." The company point out that travelers will see this sign in front of the stores of prominent merchants wherever they go, and that the sign is one which the dealers will find draws trade.

THE PECK-WILLIAMSON COMPANY, Cincinnati, Ohio, intimate that dealers can largely increase their trade by handling the Peck-Williamson Underfeed Furnace by reason of the merits of the heater. Reference is made to the economical consumption of fuel, and to the fact that heat which is ordinarily allowed to escape to the chimney is utilized in a way to produce the most satisfactory results. An attractive booklet which the company have issued tells all about this Heater, and it is intimated that no one can read it without understanding that the Peck-Williamson Underfeed Furnace will burn less fuel, radiate more heat and keep the house warmer than any other.

### A Retail Hardware Consolidation.

An advertisement is noted in an Oil City paper of application to be made to the Governor of Pennsylvania for a charter for an intended corporation. An inquiry of one of the officials of the proposed combination elicited the information that the intended corporation are to be known as the United Hardware & Supply Company, the purpose of which will be to deal in hardware and supplies in the various cities in that section. Their capital, as stated in the application, will be \$500,000. Among the subscribers to the capital stock are Joseph Seep and S. S. Bryan of Titusville, Charles J. Kirk of New Castle and Eugene and Arthur Seep of Oil City. It is the intention of the proposed combination to acquire the stores of S. S. Bryan, Titusville; Kirk & Smith Company, New Castle, and Seep Bros. of Oil City. The object of this consolidation is to effect an economy in management and purchases, and to distribute merchandise at minimum cost.

The president of the new organization will be Chas. J. Kirk of New Castle, for over 20 years identified with the leading hardware business of that city. The treasurer will be S. S. Bryan of Titusville, who has been in the hardware business in Titusville for nearly 20 years, and before that was with a large jobbing house in Pittsburgh.

S. S. Bryan, who is the originator of this proposed combination, is well known by the hardware trade throughout the country as having been active in the formation of the first National Retail Hardware Dealers' Association. It is nearly 25 years since he started in business, having received his early business education in the wholesale hardware house of the Logan-Gregg Hardware Company of Pittsburgh. Joseph Seep, one of the directors, is a millionaire and a Standard Oil Company official. He is a director of the Seaboard National Bank, New York, and many other large financial and manufacturing companies.

## MICHIGAN RETAIL HARDWARE DEALERS' ASSOCIATION.

In our last issue brief reference was made to the eighth annual convention of the Michigan Retail Hardware Dealers' Association, which was held at the Cadillac Hotel, Detroit, on Wednesday and Thursday, August 13 and 14. President H. C. Minnie called the convention to order on Wednesday morning and announced the appointment of the following committees:

COMMITTEE ON CREDENTIALS: C. E. Pipp, Otsego; Chas. Harris, Detroit; A. J. Scott, Marine City.

COMMITTEE ON RESOLUTIONS: J. J. Potter, Alpena; F. McLean, Jackson; E. D. Foote, Flint.

COMMITTEE ON CONSTITUTION AND BY-LAWS: E. S. Roe, Buchanan; J. B. Sperry, Port Huron; F. Brockett, Battle Creek.

SPECIAL COMMITTEE TO DRAFT RESOLUTIONS UPON THE DEATH OF SENATOR McMILLAN: Henry C. Weber, Detroit; T. Frank Ireland, Belding; G. E. Bishop, Dowagiac.

On assembling in the afternoon the special committee appointed to draft resolutions upon the death of United States Senator James McMillan, gave in their report and mentioned that the late Senator had at one time been actively engaged in the hardware business. The resolutions were ordered placed upon the minutes. The convention then went into executive session.

Secretary Weber read a communication from Detroit manufacturers and jobbers inviting the members to participate in a boat ride to St. Clair River and Flats, with supper at the Old Club. The invitation was extended in behalf of the following concerns: Acme White Lead & Color Works, Art Stove Company, Boydell Bros., Buhl Sons Company, Detroit Stove Works, Fletcher Hardware Company, Freeman, Delamater & Co., Edward Frohlick Glass Company, Michigan Stove Company, Peninsular Stove Company, Pittsburgh Plate Glass Company, William Reid, Standart Brothers Company.

After the annual address of President Minnie, Treasurer Weber read his annual report, showing balance on hand a year ago of \$222.19. Receipts for the year were \$577.21 and disbursements \$410.34, leaving a balance in the treasury at the present time of \$390.06. Secretary Weber's report, which was accepted and adopted, showed a very satisfactory condition of affairs in the association with increasing membership.

### Papers.

A paper upon "Organization, General and Local" was read by A. Harshaw of Delray. President Minnie announced the appointment of Charles Harris as sergeant-at-arms. A paper on "Would Mutual Fire Insurance Benefit Our Organization?" by John Popp of Saginaw, proved of unusual interest, and was followed by a warm discussion, participated in by a number of members. Among others, H. G. Cormick, president of the National Retail Hardware Dealers' Association, who was present, gave some instructive information in regard to what had been accomplished by mutual fire insurance companies in other States. Mr. Cormick was followed by Secretary Weber, who read a paper embodying some pertinent remarks on the subject of mutual fire insurance. Irving A. Sibley of South Bend, Ind., was also invited to contribute to the discussion, and gave an interesting address on the same subject. A. H. Whitney of Merrill, being absent, T. Frank Ireland read the paper that he had prepared on "My Faults in Business As Others See Them," which was followed by a discussion.

### THURSDAY.

The Thursday morning session was marked by the presence of Congressman William Alden Smith of Grand Rapids, who gave a congratulatory address. Mr. Smith was followed by a paper on "Best Methods of Conducting a Retail Hardware Store," by R. G. Chandler of Coldwater. Another paper by B. F. Schumacher of Ann Arbor on "A Retailer's Views of a Jobber Who Retails" proved one of the most interesting of the session, and was followed by warm discussions, which would have made the ears of any offending jobber ring.

At the Thursday afternoon session President Minnie announced that as the election of officers would be held, he had appointed Messrs. Weber of Detroit and Winchester of Jackson, a Committee on Nominations. H. G. Cormick, president of the National Association, was

then invited to address the association, which he did in a most acceptable manner. Hon. B. A. Nevins of Otsego, Mich., then spoke upon the subject "Each Viewing the Other; Consumer Versus Retailer." The paper disclosed a thorough acquaintance with business affairs and the trend of the forces which are at work in the social as well as in the business world. It was a close study of the subject, fortified by statistics.

### Question Box.

The Question Box proved a particularly interesting feature of the session. Among the questions were the following:

*Is it a fact that the catalogue houses are hurting the trade of the jobbers as much as they are the retailers? Should the jobbers assist the retailers against the catalogue house competition and the people who supply them?*

It developed in the discussion that followed that the effort which has been made to prevent manufacturers from selling direct to catalogue houses has met with considerable success, and that further progress was expected in the future. The sentiment was expressed that catalogue houses should be placed in the same category as large retailers and not treated as jobbers by manufacturers.

*Should we take a decided action this coming year to control the exclusive retailing of merchandise that usually belongs to a retail Hardware store, which can be done, no doubt, by concerted action?*

This subject had been covered by action previously taken by the convention, in that a circular is to be addressed to the jobbers indicating the line of action the retailers demand.

*How can we best avoid price cutting that is usually started by a competitor?*

The answer given was "by local organization." Mr. Popp of Saginaw was here called upon to explain the methods by which the local organization at Saginaw has proven unusually effective in eliminating ruinous competition and price cutting.

*Does this Association consider the advance in stoves warranted?*

The answer was that it seemed immaterial what the opinion of the retailer may be. The advance had been made by the manufacturer, and must be paid by the retailer.

*Is there any disadvantage in early closing?*

This question brought out the fact that a majority of the dealers who formerly kept open until 9 and 10, and even later, at night, now generally close at 6 and 7 in the evening, and have discovered no falling off in trade as a consequence.

*Is it practicable for manufacturers to establish a retail price on staples or a special line of goods?*

Discussion developed that few, if any, of the retailers had any objection to the practice referred to.

### Election of Officers.

The Nominating Committee, consisting of John Popp, Saginaw; J. B. Sperry, Port Huron; J. J. Potter, Alpena; G. E. Bishop, Dowagiac, and L. Whittenack, Tecumseh, recommended the following ticket for election:

PRESIDENT, T. Frank Ireland, Belding.

VICE-PRESIDENT, John Popp, Saginaw.

SECRETARY, A. J. Scott, Marine City.

TREASURER, H. C. Weber, Detroit.

EXECUTIVE COMMITTEE FOR TWO YEARS: J. B. Sperry, Port Huron; F. A. Turner, Caro; J. G. Patterson, Detroit; F. S. Carlton, Calumet; S. E. Hunt, Detroit.

As there was no opposition it was determined, upon motion, that the secretary cast the unanimous vote of the association for the various offices to be filled. The chair appointed Messrs. Weber and Winchester a committee to escort the newly elected officers to the platform. All the officers in turn were called upon for remarks, to which they responded gracefully.

Mr. Weber of Detroit pledged himself to be present and to be one of a number to bring in one new member at the next meeting of the association.

JAS. TOBIN has lately opened a store in Fond Du Lac, Wis., for the sale of Shelf and Heavy Hardware, Stoves and Tinware. The building has been fitted up at a cost of \$6000, and its arrangement is attractive and convenient. B. C. Blancher will manage the store.

## BOSTON MASTER PLUMBERS.

The annual outing of the Master Plumbers' Association of Boston and vicinity was held at the Bass Point House, at Nahant, last week and was attended by about 300 members and their families. The principal feature of the entertainment was the baseball match between the representatives of the supply houses and the master plumbers. The score, which was 7 to 4, reflects a sharp contest and a creditable victory to the supply house men. A shore dinner was served at 2 o'clock, and in the evening the athletic programme was completed. The 100 yard dash was won by Andrew Granara and the fat men's race by Mr. Gorman. The 100 yard dash for women was won by Miss S. O'Connell, the second prize being taken by Miss Ellen O'Connell, and the third prize by Miss Emma Shanahan. The mirth provoking feature of the outing was a three legged race, which was won by Maynard and Granara, the second prize being awarded to Cummins and Duffield. There were a number of other contests, and the entertainment continued until a late hour. The committee in charge consisted of Thomas J. Tute, John P. Drury, National Executive Committeeman David Craig and Thomas Gavin.

### Thomas Devlin & Co.

Thomas Devlin & Co., Philadelphia, Pa., purchased some months ago a site for the erection of a manufacturing plant at Burlington, N. J., on the Amboy Division of the Pennsylvania Railroad, as previously reported in these columns. The property is known as the "Old Burlington Boys' College Grounds," and is 1800 x 900 feet in size, situated on the Delaware River, Reed and Pearl streets. At present a malleable iron foundry, core room, tumbling and sorting room, annealing room, boiler, engine and pump house, storage room and minor buildings are to be erected. In the near future they contemplate the erection of a gray iron foundry of the same size as the malleable iron foundry, gray and malleable iron storage buildings, two three-story machine shops, stock houses, pattern shop and vaults, brass foundry, office building, &c. The malleable iron foundry is to be 420 feet long and 56 feet inside width, three wings, 56 feet in length and extending 46 feet each, will join the main building. This foundry will be served by three air furnaces and two cupolas. Industrial railway tracks will serve all parts of this and other buildings, while jib cranes will be installed for handling the heavy work. This building will be of brick with slag roof, the side walls are to be 23 feet high and the clear height under the roof trusses at the center is 17 feet 1 inch. The core shed will adjoin the foundry on the east end, and will be a one-story iron and brick building, 79 x 100 feet, and will be equipped with modern conveniences. The annealing room will be 204 x 71 feet, and will be placed just south of the foundry; the tumbling and sorting department being situated between this and the foundry. Eight annealing ovens will be built at the present time. The boiler, engine and pump rooms will be situated at the east end of the annealing room, and will occupy a space 45 x 71 feet. Specifications have been prepared for these and minor buildings, and it is hoped that operations may be started at an early date, so that they may be completed by the end of the year, it being the intention to have iron running in the new malleable iron foundry by January 1, 1903.

### The [20 Series Standard Boilers.

Those who have a demand for a round heating boiler of exceptional heating capacity will be interested in the 20 Series Standard boiler put on the market by Giblin & Co., Utica, N. Y. The success of this boiler is assured from the fact that the same construction is followed that has proved efficient in the company's well-known Standard boilers. The ash pit is of a substantial construction and adapted to the fire pot section, and the grates are of the labor saving type. Between the feed section and the dome, a sectional casing is placed to

form the walls of the combustion chamber and the smoke outlet is provided at the rear, as shown in Fig. 1. The deflector plates are provided directly back of the flue opening to throw the heated gases to the front, and where they strike on the bottom of it and pass around to the final outlet. A plan view of the feed section containing the vertical flues is shown in Fig. 2, from which it can be seen that not only a large amount of heating surface is exposed, but that it is also subject to the di-

The 20 Series Standard Boiler.—Fig. 1.—View Showing Flue Construction.

rect radiation of an intense heat from the fire. The burning gases rise through its flues to the horizontal flues under the dome and to the final outlet. It can also be seen that this construction affords, immediately above the fire, a very effective crown sheet. The fire pot and feed sections are connected by means of extra heavy wrought iron push nipples and held in position by large bolts, preventing leakage. When the heater is used for steam a higher dome is provided at the top and through the internal construction provision is made for an unrestricted internal circulation. A steady water line is assured in the steam boilers, although they are also provided with an outside circulating pipe.

The boilers are recommended for use with soft coal

Fig. 2.—A Plan View of Feed Section.

on account of the facilities provided for removing soot from the horizontal flues and the ease with which any accumulation can be removed from the vertical flues which are made largest at the bottom. The 20 Series Standard boilers are made with fire pots 18, 20½, 24½ and 29 inches in diameter; but, by the means of additional horizontal upper sections they are made to carry 275 to 800 square feet of direct radiation for steam and from 425 to 1325 square feet of direct hot water radiation.

The company have just issued a new 40-page catalogue devoted to their steam and hot water heating apparatus.

## THE DRAKE SERIES C ACETYLENE GENERATORS.

With a view to presenting an acetylene gas generator which overcomes the various defects that have been discovered in the use of acetylene illuminating apparatus.

through the water in the generator and by the way of the pipe R escapes from the generator to the bottom of the seal chamber B. From here it passes up through the water and passes the condensation chamber D and enters the gasometer bell through the third body of water, where it is stored until consumed. Passing through these different bodies of water has the effect of

*The Drake Series "C" Acetylene Generators.—Fig. 1.—General View.*

the International Heater Company of Utica, N. Y., have recently brought out the Drake Series C acetylene gas generator, a general view of which is shown in Fig. 1. It has been found that a more satisfactory service is derived from generators which are so constructed; that a fixed charge of carbide is dropped into a certain quantity of water by arranging both the carbide and the water into units of known proportion. The possibility of dropping too much carbide into the water or too much water upon the carbide, through derangement of any part of the apparatus, is thus avoided. It has also been found that benefit attends the arrangement of every working part so that it is not only accessible, but where it can be readily seen and so that the carbide supply can be known at a glance.

The new Drake Series C generator is arranged with a gasometer tank, a condensation chamber and a sealed chamber filled with water to start the apparatus. Each of the special generators and the central sealed chamber B are filled with water through the filling lip F. Inside these generators is a trap door upon which the charge of carbide rests securely above the water compartment. After the generators are charged the clamps are adjusted to the covers of the generators and they are ready for the generation of gas. The carbide charges are designed to produce sufficient gas to fill the gasometer about three-quarters full so as to allow a wide margin for safety in case of overcharge or accident. As one of the charges is dropped into the water compartment and the gas is generated, the gasometer rises and as the gas made is consumed the bell lowers until the push arm P comes in contact with the ratchet arm O, which in turn operates the shaft Q, and the gears at the other end revolve the track Z, shown in Fig. 2, until one of the subgenerator rods is dropped, tripping a charge of carbide into the water compartment, when the generator of gas begins again and the gasometer tank rises. As the gas is generated it passes up

cooling the gas and preventing decomposition and kindred troubles.

In addition to this careful arrangement of the generators and the gasometer the Drake generator is also

*Fig. 2.—The Plan of the Subgenerators.*

equipped with the drier and screen shown in Fig. 3. The gas enters the drier through pipe 14, and any moisture that it may carry as a result of this passing through the water is here removed. From the chamber below it passes through the pipe 15 into the screen where any

fine particles of any character are separated from the gas by means of the screens, which are constructed of special material adapted for the purpose, so that when the gas enters the piping system it contains nothing that is calculated to carbonize at the burners, clog the piping or give trouble from any cause.

This new form of generator is made in ten sizes, the first six being adapted for residences and larger buildings having capacity for feeding from 50 to 250  $\frac{1}{2}$ -foot burners for a period of ten hours with charges of carbide consisting of from 50 to 250 pounds, or a capacity of feeding from 100 to 500 lights for a period of five hours. The four larger sizes have a capacity of feeding from 300 to 500  $\frac{1}{2}$ -foot burner for a period of ten hours, or from 600 to 1000 burners for a period of five hours, with charges of carbide from 300 to 500 pounds. These larger sizes are well adapted for municipal lighting, and the largest size can be located in a space 7 feet 8 inches x 21 feet 4 inches. It is also pointed out that

Fig. 3.—The Drier and Scrubber.

these generators will operate to their full capacity without recharging and without removing the residuum. It will be noticed that the generators shown in Fig. 1 are arranged with large draw off faucets for the removal of the residuum, when it is necessary to clean the apparatus and recharge it.

The company have recently issued an illustrated pamphlet dwelling at length on the various features of merit which their generators possess and the conditions they are qualified to meet.

### Brown & Wales' Plumbing Goods.

A catalogue of 95 pages, devoted to sanitary specialties and plumbing supplies, has been issued by Brown & Wales, 69-83 Purchase street, Boston, Mass., who have just increased their facilities for handling plumbing supply orders promptly. The catalogue opens with a brief statement that it presents but a few of the strictly high grade goods which the house carry and that their stock includes a full line of first-class plumbing material. The first 20 pages show views of fine bathrooms and pictures of Ideal solid porcelain Roman bathtubs and Ideal French bathtubs, followed by handsome enameled cast iron bathtubs of the French, Roman and modified French patterns, with wide and narrow roll rims, and various styles of supply and waste fixtures, with shower baths of different styles and shower bath

curtains. Enameled sitz tubs and foot tubs are shown as well as galvanized steel tubs and enameled tubs. Another section of the catalogue is devoted to compression and fuller bath cocks, and connected waste and overflow fixtures. Fifteen pages are occupied by lavatories, including the Ideal porcelain elliptical lavatory on a porcelain pedestal and various styles of porcelain roll rim lavatories. These are followed by lavatories made up of various kinds of marble in many styles and forms, supported by legs and also by brackets, with various styles of supply and waste fixtures and traps. A number of enameled iron lavatories adapted for fine residences and less pretentious buildings are also presented. Kitchen sinks of enameled iron, porcelain pantry sinks, drinking fountains and wash trays form another section and various styles of compression valve and self closing basin cocks, basin wastes, chain stays, traps, brackets and legs for lavatories occupy a number of pages. Water closets with high and low down flushing tanks and with the Volumeter flushing valve are awarded special notice. These closets are of the siphon jet and siphon wash down character. Siphon eduction range closets are followed by shower bath equipments, closet valves, bathroom mirrors and a variety of combination bathroom fixtures, such as cup holders, soap holders, sponge baskets, towel rods, bath seats, &c., and the catalogue closes with a variety of standard brass goods, hopper closets, closet tanks, closet seats and flushing pipes.

### Will It Increase the Sale of Heating Apparatus?

The last number of the *Official Bulletin* of the National Association of Master Steam and Hot Water Fitters says that the National Executive Committee of the association has been devoting considerable time and attention to the matters placed in their hands by the members at the last convention, and that among the items requiring attention is the one concerning boiler manufacturers making plans and specifications for heating work. Commenting on this subject the following statement is made:

Considerable dissatisfaction has been expressed by various members over the action of certain manufacturers who are charged with following the practice which is such a detriment to the legitimate master steam fitters. Complaints are now being investigated, and we request all members to place in our possession any facts that they possess which will throw light upon this question.

The resolutions upon this subject passed at the last convention mean exactly what they say, and we expect our members to follow the example of certain loyal members who recently placed orders for boilers with manufacturers who do their best to live up to the spirit as well as the letter of the resolutions.

The resolutions are as follows:

"Whereas, Certain boiler and radiator manufacturers canvass our prospective customers and make plans, specifications and estimates for them to our injury, and,

"Whereas, These boiler manufacturers endeavor to have tinsmiths do the work under the boiler manufacturers' supervising; therefore be it

"Resolved, That it is detrimental to our interests to purchase goods of boiler or radiator manufacturers who make plans, specifications or estimates on heating work."

The above resolutions contain no uncertain or ambiguous language.

### Equation of Pipes.

I wonder how many of my brother engineers, asks a writer in the *Engineer*, know that the diameter of a circle, or a pipe, with an area equal to that of any two other ones, may be found without any calculation by means of nothing but the square corner of a board and a rule. The process is simply to lay off the two diameters on the two edges of the board and measure diagonally from one to the other. If you have a carpenter's square the process is reduced to the simple diagonal measurement.

Where three or more pipes are to be led into one, convert two into an equivalent and work as with only two pipes. I find this simple method of great assistance in the engine room, as you can see at a glance, almost, what size pipe is required without any calculation.

## PIPING MATERIALS FOR STEAM PLANTS.\*

### IN TWO PARTS. PART II.

#### FLANGES.

There are two recognized standards for cast iron flanges at present in use. It has taken some time to bring about uniformity, but all the large manufacturers have now agreed to adopt the tables. We attach to this paper dimension sheets covering all details.† Table No. 1 is for steam pressures up to 125 pounds. This table was adopted by a joint committee of the Society of Mechanical Engineers, the Master Steam Fitters' Association, and the manufacturers. Table No. 2, for pressures up to 250 pounds, was adopted at a meeting of manufacturers held in New York on June 28, 1901. It is generally referred to as the "Manufacturers' Standard." It would be a great convenience to all manufacturers of piping material and their customers if the Association of Steam Engine Builders would adopt these standards for all piping connections. The diversity in diameters and drilling of flanges on engines, pumps and condensers is the cause of much trouble and delay.

#### FLANGED FITTINGS.

We manufacture these fittings in three weights, the lightest for very low pressures, such as exhaust or condenser connections; the second for standard pressures up to 125 pounds, and the heaviest for high pressure lines up to 250 pounds per square inch. The thickness of body metal in the three styles is as follows:

|              | Light.<br>Inch. | Standard.<br>Inches. | Extra heavy.<br>Inches. |
|--------------|-----------------|----------------------|-------------------------|
| 6-inch.....  | ..              | 9-16                 | ¾                       |
| 10-inch..... | ..              | ¾                    | 1 5-16                  |
| 12-inch..... | ½               | 1 13-16              | 1                       |
| 16-inch..... | ¾               | 1                    | 1 3-16                  |
| 20-inch..... | 1 1-16          | 1 1-18               | 1 5-16                  |
| 24-inch..... | ¾               | 1 ¼                  | 1 ¼                     |
| 30-inch..... | ¾               | 1 ½                  | ..                      |
| 36-inch..... | 1               | 1 ¾                  | ..                      |

Applying to these fittings the well-known formula for cast iron pipe,  $P \frac{2T}{D} \times \frac{S}{5}$  in which  $P$  = pressure,  $T$  = thickness of metal,  $D$  = diameter,  $S$  = tensile strength and 5 = factor of safety, it will be seen that we have largely increased the factor of safety to cover possible defects in the metal, core shifts, or other imperfections.

For example, solving the factor of safety  $F = \frac{2TS}{PD}$  and in the case of a 16-inch extra heavy fitting to carry 250 pounds working pressure we have 1 3-16 inches of metal with a tensile strength of 20,000 pounds, then  $F = \frac{2 \times 1.18 \times 20,000}{250 \times 16} = 11.80$ . In a 12-inch extra heavy fitting  $F = 13.33$ , and in a 24-inch extra heavy fitting  $F = 10$ .

An excess of strength is desirable, as the fittings have to stand the strains incident to changes in temperature, vibration and settling of the pipe line. These conditions make it necessary to use rather heavy flanges and of necessity body metal thick enough to carry the flanges without shrinkage strain. We have also demonstrated by a large number of tests that a formula which may be fairly accurate for cylinders is subject to some modification when applied to tees, elbows and crosses. In fact, the majority of the fittings burst at pressures considerably below that indicated by theory. In all cases, however, we have a safety factor high enough, and the thickness of metal may be considered well adapted to the purpose for which the fittings are used.

#### VALVES.

In valves the call is now for the straightway type. A number of angle valves are still used on boiler or engine leads, but a globe valve on a plant of any magnitude is very exceptional. They are still used freely on small lines and wherever it is necessary to throttle the steam. Beyond this the gate valve has so many advantages that it has practically secured the market. To

cover the range of power plant work we have had to build four lines as follows:

1. Low pressure for exhaust and condensing lines.
2. Standard for pressure not exceeding 125 pounds.
3. Medium for pressure not exceeding 150 pounds.
4. Extra heavy for pressure not exceeding 250 pounds.

Upon the low pressure line we have not made very exhaustive tests, further than to ascertain that the valves are tight at 50 pounds per square inch. The other lines have been thoroughly exploited on all except the very largest sizes. Boiling down the results and striking general averages we arrive at the following: Standard valves, 4 to 8 inches, will burst at about 700 pounds; standard valves, 10 to 16 inches, will burst at about 600 pounds. The larger sizes we have not burst, but have tested the 18-inch to 450 pounds and 20 to 30 inch to 300 pounds pressure without injury. The medium valves will withstand a pressure of about 500 pounds in excess of the standard. Extra heavy valves, 4 to 8 inches, burst at 1600 to 1900 pounds; extra heavy valves, 10 to 16 inches, burst at 1200 to 1500 pounds.

The larger sizes have not been destroyed, but the 18-inch has been subjected to 850 pounds and the 20 and 24 inch to 600 pounds without injury. The same thickness of body metal is used in the valves as given for flanged fittings, except that all gate valves have the metal increased at the top of the body to carry any settling strains.

The next point to ascertain was the maximum load which could be applied to the disks without causing a leak. This load was found to be in nearly all cases 80 per cent. of the ultimate strength of the body.

It must be borne in mind that all pressure valves mentioned were of the solid wedge type. It is not possible to obtain equivalent results from parallel seated double disk valves, for the reason that the latter have two comparatively light faces set out by an internal wedging mechanism, and the face exposed to pressure will spring under a load very much less than can be sustained by a solid wedge.

It has been the custom for many years to rib the bodies of high pressure valves. The ribs give a massive appearance, and are desirable on that account from the standpoint of the selling department, but they serve no good purpose mechanically and are a detriment instead of an advantage. The distribution of metal is so uneven that shrinkage strains are set up all along the corners where the ribs join the body, making the metal porous. A ribbed valve will not stand any more pressure than one with a plain body, and the only point which might be argued in favor of the ribs would be that they stiffen the valve against strains due to settling in the line. It is not, however, very logical to guard against a remote possibility by setting up a number of internal strains, especially where a plain bodied valve can be designed which will take care of all strains reasonably to be anticipated. We have concluded to abandon the ribs altogether, and shall hereafter only make valves of that style on special orders.

For high pressure work we always recommend valves having outside screw and yoke, stationary wheel and rising spindle; in fact, for any service this type is preferable, except on the very large sizes where the great height from top of spindle when open to the bottom of the valve is a serious objection. The advantages over the internal screw valves are as follows:

1. The stem is an indicator showing at all times the position of the disk.
2. The thread on the stem is never in contact with the steam and can be properly lubricated.
3. There is no thread in the wedge.

Bypasses should be used on valves 8 inches and larger when high steam pressure is used. The load on the wedge of an 8-inch valve at 180 pounds pressure is 9047 pounds, and on a 16-inch valve 36,190 pounds. It is obvious that under such loading the pressure must be partially equalized on each side of the wedge before the valve can be opened with facility.

#### PIPE BENDS.

Bends are being used very freely. By their use all expansion strain can be taken up and the number of joints materially reduced. In the process of bending the

\* Paper read by John B. Berryman, manager engineering department Crane Company, Chicago, before the Engine Builders' Association of the United States, at Pittsburgh, May 22, 1902.

† We have omitted these sheets.

outer circumferential wall of the pipe is stretched, as the inner wall will not compress to any extent without buckling. There is also an appreciable loss of metal through scaling. Unless the bends are of very short radius they are generally made of standard pipe for pressure of 125 pounds or less, full weight pipe up to 175 pounds, and extra heavy pipe for higher pressures. If the bends are used to take up expansion it is well to make them of pipe as light as is consistent with safety. The shape of the bends will determine generally the material which ought to be employed, as in those with large radius the stretching of the metal may be almost disregarded.

In conclusion we strongly advocate the use of staple, catalogued goods wherever possible. Such a variety of fittings and valves may be obtained now from stock that there does not seem to be any necessity for the enormous number of specials which we, in common with other establishments in our line, are daily called upon to make. Many times these specials serve no other purpose than to put into concrete form some whim or fad of the engineer in charge of the installation.

Specials are often the product of theory only. Staples result from theory and experience. A purchaser who buys a staple article from a reputable house has the assurance that such an article has been thoroughly tried out, possibly hundreds or thousands of them, under conditions similar to his own. In addition he can get reasonably prompt shipment and the benefit of a lower price due to special machinery and the elimination of pattern labor.

[THE END.]

### CANADIAN MASTER PLUMBERS.

The annual convention of the National Association of Master Plumbers of Canada was held at Halifax, N. S., last week. It was largely attended and was devoted to a discussion of matters pertaining to the plumbing trade, with a view to protecting the interests of the trade. At the close of the meeting the following officers were elected for the ensuing year:

*President*, Frank Powers, Lunenburg.

*Vice-President*, P. C. Ogilvie, Montreal.

*Secretary*, Geo. A. Perrier, Halifax.

*Treasurer*, Ald. Lamarche, Montreal.

*Provincial Vice-Presidents*, Ontario: W. H. Meredith, Toronto; Quebec, E. Lesperance, Montreal; Nova Scotia, Jas. Farquhar, Halifax; New Brunswick, Wm. Watson, Moncton; British Columbia, H. Mahoney, Guelph; Manitoba, A. J. Hammond, Winnipeg.

It was decided to hold the convention at Montreal next year. The delegates were entertained by an excursion on the harbor and in the evening were given a pleasant surprise at the Bedford.

### Canadian Sanitary Committee Report.

Through the courtesy of J. W. Hughes, Montreal, Canada, chairman of the Sanitary Committee of the National Association of Master Plumbers of Canada, we are enabled to present the following report read at the annual convention in Halifax, N. S., on August 16:

Your Sanitary Committee have the honor to report that during the past year there has been no falling off in the interest taken by the public in sanitary matters. The educational campaign, begun some years ago by the doctors, the press and the pulpit, has been kept up, and is from year to year producing an increased interest in this important matter. Statistics show that the average duration of life has been considerably prolonged, the great gain being along the line in which we are more particularly interested—namely, domestic sanitation. While some diseases continue to carry off their unfortunate victims at the former rate, those diseases known to be the result of filth, impure food and foul air, in other words, diseases produced by controllable causes, are yearly becoming less fatal and frequent.

As good plumbing is now acknowledged to be a most, if not the most, important feature in bringing about this satisfactory state of affairs, your committee feel that our master plumbers are reaping the reward of the time, energy and means they have employed during the past, and can honestly be congratulated on the fact that their labors have not been in vain. While this is the case our vigilance must not be relaxed. We are only

on the threshold, and at the very beginning of our work, which must not cease until certain diseases, now so prevalent, are as rare as the once so deadly typhus fever.

The old simple form of plumbing has no longer a *raison d'être*. New methods, improved apparatus and materials are being constantly brought into the market and, under keen business pressure, pushed in a manner formerly unknown. The plumber of to-day must be in a position to distinguish the good from the bad, and protect the public and himself from imposition, for the old adage "that all is not gold that glitters" is constantly to be borne in mind in this connection.

While the many changes may to a certain extent have reduced the necessity of knowing "how to do," the reasons for knowing the "why" have increased tenfold. Education in the sciences forming the basic principals of our art is to-day more than ever necessary. The great question, in the opinion of your committee, is how are young men, the plumbers of the future, to be trained? A knowledge of the skill of hand it is already difficult to attain in the shops. Where are they to attain the scientific knowledge so indispensable, if they are to rank as more than skilled laborers and be competent to undertake work on the correctness of which, to a large extent, depends the safety of our people's most valuable and important asset, good health?

Can it be had in the colleges? Yes; but plumbers do not attend these important seats of learning. The common school? No. Such training forms no part of the common school course. The technical school? Perhaps; in a modified form. Then there seems to be no other alternative than that of establishing in all large centers first-class plumbing schools, such as that founded by the late Colonel Auchmuty of New York.

In conclusion, your committee earnestly commend the question of the education and training of the plumber of the future to the serious consideration of our association.

### THE PLUMBING AND STEAM SUPPLY BOWLING LEAGUE.

The following letter sent out by Martin Behrer, president of the Plumbing and Steam Supply League of New York, will be received with pleasure by the bowlers in the local supply trade, who still have a keen appreciation of the enjoyment derived from the tournament run last winter. Benefit always attends the relaxation from the cares of business when those who participate in it not only get good exercise but also broaden their acquaintance. They establish relations with their competitors which avoid the friction that accompanies estrangement. Such association as was brought about by this bowling league last winter is a good thing for the trade and we hope that success will again attend the effort to bring competitors together in a friendly contest. President Behrer's letter is as follows:

In order to make arrangements for the alleys on which the coming tournament of the Plumbing and Steam Supply League will be held, it is necessary to ascertain at an early date how many members will take part, in order to determine the number of nights in each week required to complete the schedule, and also as to what nights, exclusive of Saturday, would be most convenient on which to roll.

I would therefore thank you to advise me as soon as you possibly can regarding same. If you should know of other jobbing houses who did not roll with us last year and who would like to enter a team, would you kindly have them forward their application to me at once, explaining to them that teams are wanted composed of representative men of our trade?

All teams intending to contest must send their entrance fee, \$10, and names of team and substitutes to the treasurer, Fred. Lowe, 90 Beekman street, on or before September 1, 1902.

SECRETARY H. A. SMITH of the Eastern Trade Golf Association, 1123 Broadway, New York, has issued, under date of August 11, a letter giving the names of the new members added to the Association since his last letter was issued, and inviting those in the heating and plumbing goods manufacturing trades to take membership in the association and enjoy the social side of business life, which is the principal object of the association. The benefit derived from previous efforts in this direction have demonstrated their value and tradesmen will do well to arrange their business so as to meet their competitors when the strenuous side of trade has been relegated to the rear for a season.

## FUEL OIL APPARATUS.

Those who are called upon to equip power plants and manufacturing establishments with fuel oil burning furnaces and apparatus will find valuable information in the catalogues issued by the Rockwell Engineering Company, 26 Cortlandt street, New York. Boiler makers will be specially interested in a portable oil burning rivet forge which by means of a hose connection enables the forge to be moved within a wide radius for the convenience of the operator and which has a large capacity in rivet heating for either indoor or outdoor use wherever boiler work is being done. The catalogue contains a sheet printed in red stating that the company have been manufacturing and installing fuel burning appliances for 15 years and guarantee every installation. They design and complete furnaces for every purpose, using oil as fuel, and are prepared to install a complete equipment, including tankage of any capacity, and give instructions for the operation so that any first-class mechanic can either erect or operate.

Catalogue B consists of 16 pages and is devoted to fuel oil burning apparatus for boilers, whether in manufacturing establishments or on steamships. The Rockwell fuel oil pumping system is so arranged that it will automatically supply oil from storage tanks to burners by means of exhaust steam to a high temperature, carrying the oil in under a uniform and high pressure under the best condition for rapid and complete combustion, whether the oils be light or heavy. It is positive in operation, not depending upon gravity, and has no oil above the burners. The burner is made of the best steam metal, nickel plated and the nozzles are of durable bronze. They are fitted with valves and brass unions for receiving the oil from the tanks and the steam or compressed air for feeding the jets at the nozzle, the supply being governed by a very powerful needle valve. The construction is such that the working is simple and it can be operated readily by the engineer or fireman. This catalogue also shows oil hose for unloading tank cars, oil meters, storage tanks, tell tale and ventilator pipes and burner tiles. It also gives views of boilers equipped with the Rockwell fuel oil burners, one engraving showing a tank car discharging into the storage tank from which, by means of the company's duplex system, the oil is fed to the burners under the battery of boilers.

Catalogue C consists of some 50 plate pages showing a great variety of furnaces which have been designed and constructed by the concern for various customers. Annealing and hardening furnaces of various sizes, from a small to a very large capacity, are shown. The wide adaptability of oil fuel is indicated by the apparatus shown which includes brass and copper scrap melting furnaces, rivet heaters, revolving cylinder annealing furnaces, double deck hardening furnaces, double and single and annealing furnaces such as are used in large sheet mills, pot annealing furnaces, crucible brass melting furnaces in a long series, wire baking and wire brazing furnaces, enameling furnaces, five-plate cloth singeing furnaces, automatic billet heating furnaces, steel casting annealing furnaces and liquid boiling furnaces. Plates are also given containing views in manufacturing establishments equipped by the company, including forge furnaces, lead and sand tempering furnaces and regenerative welding furnaces.

## A Large Plumbing Contract.

The sanitary appointments in the entire plumbing system of the new Ansonia apartment building, New York City, have been constructed by Milton Schnaier & Co., 347 Columbus avenue. It is said to be the largest plumbing contract ever executed in the United States, amounting to \$350,000. Among the features of unusual interest is a swimming pool with a capacity of over 300,000 gallons, which is supplied with water from the Hudson River. Hot and cold salt water baths will be furnished as well as fresh water baths and all the water is filtered to insure its being perfectly clean. The system for supplying water to the plumbing system is a departure from the beaten track. Some two

years have been expended in completing the work. The building contains over 400 bath rooms, each of which is equipped with a solid porcelain bathtub, wash basin and water closet. Aside from these bathrooms there are 600 additional toilet rooms and 800 additional wash basins. The establishment is equipped with ice water plants and the kitchen has a complete dish washing apparatus. The house drainage system has received the greatest attention, five separate sewer connections being made. All of the sanitary piping is made of galvanized iron pipes with screw joints into special recessed fittings, and care has been taken to arrange them so that there will be no traps or pockets, but so that the waste will flow through the pipes readily. The piping system is arranged to be thoroughly ventilated by means of fresh air inlets that cannot be obstructed and vent pipes that are carried through the roof and have the tops protected with guards.

## New York City Notes.

Richmond Branch will give their annual outing and clam bake at Silver Lake on Tuesday, August 26. The Committee of Arrangements are: C. W. Alexander, W. J. Barry, W. T. Warren, T. F. Santry, Robert Crossen, Jr., T. E. O'Halloran and D. S. Melville. Tickets can be obtained from any member of the committee.

\*\*\*

Many plumbers have said that there was no money in school work. Messrs. Kirchhof & Brown are going to disprove this statement and have taken the plumbing contract for the Commercial High School on Sixty-fifth street, between Broadway and Amsterdam avenue.

\*\*\*

John Smith of Third avenue is plumbing two private houses on Fifth avenue, between Eighty-third and Eighty-fourth streets. There are 11 bathrooms in each house. All fixtures to be Meyer-Sniffen specialties. T. J. Tuomey also has a mansion for Harry Payne Whitney at Fifth avenue and Seventy-ninth street. T. J. Byrne has two nice jobs well in hand, the Corn Exchange Bank, at 15-17 William street, and the mansion which C. M. Schwab, president of the United States Steel Corporation, is erecting at Riverside Drive and Seventy-third street.

\*\*\*

W. Y. Jack & Co. have considerable work on hand, among the good jobs being the residence of Paul G. Thebaud, at White Plains, and the alterations to the Reynal house, at the same place; the Francis G. Lloyd residence at 36 East Sixty-first street, the Speyer's School, at Lawrence street and Amsterdam avenue, and the United States Savings Bank, at Madison avenue and Fifty-eighth street.

\*\*\*

M. J. O'Brien of Sixth avenue, will be missed at the Manhattan plumbers' outing next week, as he is making an extended tour through the West. He was last heard from at the Elks' convention in Salt Lake City.

\*\*\*

Owen Costello, of Lyman & Costello, and his wife are making a visit to the "Old Country." They are expected back about October 1.

\*\*\*

Noble and Gauss, after some years of retirement as plumbers, have again entered the field and are plumbing two private houses on Riverside Drive, between Eighty-seventh and Eighty-eighth streets.

\*\*\*

W. G. Comell has the plumbing in the new banking house of Kuhn, Loeb & Co., at the corner of William and Pine streets.

THE NATIONAL TUBE COMPANY, from their McKeesport plant, exported through Eastern seaboard points 2121 tons of Iron Pipe last month. Europe was the largest purchaser, nearly 1500 tons having been forwarded to various ports in the United Kingdom and Continental Europe. Chinese and Japanese ports took 325 tons. Other shipments were made to Egypt, Cuba, Australia, Mexico and Brazil.

## Heating and Plumbing Notes.

THROUGH an error we stated in *The Metal Worker* of August 16 that the L. J. Mueller Furnace Company of Milwaukee were the contractors for the heating and ventilating of the State Capitol. We are informed by them that this is a mistake, as they do no contracting work, and confine themselves to the manufacture of goods.

THE SMITH & THAYER COMPANY, 234 Congress street, Boston, Mass., manufacturers of the Winchester Heaters, announce that they have purchased the business of George Tyler & Co., Boston, dealers in Water Supplies and Gas Engines, and will add these lines to their business. A sample room will be fitted up in which will be shown a large line of Gas Engines varying in size from 2½ horse-power to 60 horse-power. These engines are made by the Columbus Machine Company, Columbus, Ohio, for whom Smith & Thayer are sole New England agents.

THE KREIN ACETYLENE GAS COMPANY of Wapakoneta, Ohio, have placed contracts for two large factory buildings and work will start as soon as material can be obtained. The company will manufacture Krein Acetylene Gas Generators, Field Filters, Adjustable Elbows and other articles connected with the production of Acetylene Gas.

THE PHILIP CAREY MFG. COMPANY, Lockland, Ohio, manufacturers of Carey's Magnesite Flexible Cement Roofing, Asbestos Sectional Steam Pipe and Boiler Coverings, &c., after several months of scientific tests of various materials, have been awarded the contract to furnish and supply their 85 per cent. carbonate of magnesite covering at the power station of the Manhattan Railway Company, Seventy-fourth street and East River. The contract amounts to approximately \$25,000, and is said to be one of the largest closed by any Pipe company manufacturer in recent years. Among other large contracts recently closed are 21 large cotton mills; the Colorado plant of E. H. Dyer & Co. of Cleveland; 18 lake vessels built by the American Shipbuilding Company; Adams, Stokes, Astor and Macy buildings in New York.

THE McNAB & HARLIN MFG. COMPANY, 56-60 John street, New York, makers of Brass and Iron Fittings for steam, water and gas plants, will materially enlarge their plant at Paterson, N. J. They will erect two additions consisting of a brick storehouse, 50 x 100 feet, and two stories in height, and a brick machine shop, 34 x 200 feet, and three stories. This will be placed between the present shop and foundry, and have a frontage of 34 feet on Straight street and run back 200 feet to the Erie Railroad tracks.

THOMAS W. SPARKS, manufacturer of Shot and Bar Lead, 121 Walnut street, Philadelphia, Pa., has decided to engage in the manufacture of Lead Pipe, Traps, Sheet Lead, Car Seals, Lead Wire, &c., is now asking proposals for the equipment of the plant, which will be located at the present works, 131 Carpenter street, Philadelphia, where new building, &c., will be erected if necessary. Presses, mills and a full equipment will be required, as we are advised that the manufacture is to be conducted on an extensive scale.

THE RED JACKET MFG. COMPANY, Davenport, Iowa, are sending out a catchy mailing card describing the new quick repair Lift Pump for drive wells, cisterns, shallow wells, &c., which they are placing on the market.

THE C. M. KEMP MFG. COMPANY, Baltimore, Md., are erecting a three-story building as an addition to their Plumbers' Supply plant.

THE PITTSBURGH WARMING & HEATING COMPANY will, it is reported, erect a plant for the manufacture of Heating Appliances at Elm Grove, W. Va.

THE ASSOCIATION OF MASTER PLUMBERS of St. Louis, Mo., have arranged to enjoy their annual outing by means of an excursion on the Mississippi River on Wednesday, August 27. They will embark on the elegant river steamer "Hill City" for Riverside Park. A programme has been arranged that will afford entertainment for all who attend.

LANGDON & DALEY of Hartford, Conn., have a contract for plumbing and heating a fine new residence at Amagansett, N. Y., for C. A. Ensign of Tariffville, Conn. They are also plumbing the residence of Frank B. Griffin at the same place.

F. I. LESSARD & Co., Springfield, Mass., are busy with a number of heating and plumbing contracts.

THE ANDREWS HEATING COMPANY, 803 Globe Building, Minneapolis, Minn., who make a specialty of heating residences, are sending to prospective purchasers blue prints showing the floors of a building with the heating system laid out upon it, accompanied by a circular explaining their method of canvassing for the heating of buildings in the vicinity of Minneapolis. One page contains a testimonial letter from a customer, who speaks highly in favor of the company's work, and on another are cuts of the various fittings used and a *fac-simile* of their method of enumerating the parts needed to facilitate the placing of orders. Those who make a specialty of house heating will find much in this advertising matter that is of interest.

FRED. C. DUVAL of Los Angeles has purchased an interest in the plumbing business of J. H. Linkletter & Co., Whittier, Cal.

THE BURKE-BOLLMMEYER OILER COMPANY, Wauseon, Ohio, manufacturers of Oilers for windmills, have incorporated under the name of the Burke-Bollmeyer Mfg. Company for the manufacture of Windmills and Windmill and Tubular Well Supplies, in addition to their Oiler business. They have just moved into new quarters with a floor space of 6000 square feet, which they expect will suffice for present needs. The officers are S. W. Burke, president, and Fred. J. Bollmeyer, secretary and treasurer.

THE Master Plumbers of Revere, Mass., held a meeting on August 13 at the shop of W. J. Wills, when Secretary Brown of the State Association of Master Plumbers organized a branch of that association. The following officers were elected: President, Frank H. Hussey; vice-president, George A. Glover; secretary, Alex. Frazer; treasurer, W. J. Wills.

BARTLETT BROS. of Cleveland, Ohio, have secured the contract for heating the new High School Building at Warren, Ohio.

THE GOLD CAR HEATING & LIGHTING COMPANY of New York City have filed a certificate at Albany, N. Y., showing that their capital of \$1,000,000 has been paid, \$700 in cash and \$999,300 in property. The certificate is signed by Edward E. Gold, Charles W. Osborne, William E. Banks and Frank J. Menzies.

THE JEFFREY MFG. COMPANY, Columbus, Ohio, are distributing a pamphlet devoted to their Water Elevators for hand, horse-power or steam power use, designed for raising water for irrigating or drainage purposes.

NEEMES BROS., 206-214 First street, Troy, N. Y., are sending to the trade a six-page folder devoted to the Neemes Grate, which is adapted for square fire chambers of any size, and is also made in a variety of sizes for round fire boxes. The construction provides for the Grate to be divided into two parts, either part of which can be agitated by means of a lever attached to the front. There are shear bars placed between the shaking bars and in operating the lever clinkers are cut so that they will pass through to the ash pit, leaving the bottom of the fire clean, aiding the air which enters through the ample air space, and promoting a combustion which will generate an intense heat with an economy of fuel. The construction provides for expansion, and also gives the Grate a long lasting power.

THE PENNINGTON FOUNDRY & HEATER COMPANY, Pennington, N. J., and their New York agents, Phelps Brothers of 284 Pearl street, are sending out a six-page folder devoted to the Pennington N. B. M. Steam and Hot Water Heaters. These Heaters are made with 20 and 30 inch grates, and are of the vertical sectional return flue types. The folder shows general and broken views, so that the water and fire travel can be readily seen. Views are also presented of the grates, the check draft and the front, back and intermediate sections.

THE controversy over the heating system for the Lafayette High School at Buffalo, N. Y., is about to end, concessions having been made by Professor Woodbridge, Architect Hesswin, the Commissioner of Public Works and a representative of the Buffalo Forge Company. The modified specifications provide for dividing the school building into two sections for heating and ventilating purposes, an east and a west section. This will necessitate the provision of two air chambers, two fans and two engines. It is expected that the modified system will increase the cost of the work about 15 per cent.

THE F. O. RAY COMPANY, Nashua, N. H., have the contract for plumbing and heating the St. Joseph Orphanage in that city. They will install two large size Gurney Hot Water Heaters and 5000 feet of Wrought Iron Pipe.

EMMETT MARTIN, Fort Wayne, Ind., bid \$3195 and secured the contract for installing the steam heating system, to be equipped with the Paul system of air exhaust from the radiators, and piping system for the Indiana State School for Feeble-minded Youth.

THE PITTSBURGH SUPPLY COMPANY, 226 First avenue, Pittsburgh, Pa., announce that they are about to issue a new fall catalogue devoted entirely to Gas Burner Apparatus.

THE UTICA HEATER COMPANY, Utica, N. Y., are sending to the trade a portfolio of views illustrating their line of Steam and Hot Water Boilers, which will be found a great convenience to those who are canvassing for the sale of heating systems. The portfolio contains a set of 6 x 9 inch finely finished cards bearing general and sectional views of the Imperial Vertical Sectional, the Auburn Horizontal Sectional and the Keystone Combination Steel and Cast Iron Steam and Hot Water Heaters. With the aid of this portfolio a steam fitter can bring to the attention of his customers the Boiler best adapted for their use in a very convenient form. The portfolio is accompanied with price-lists of the goods.

LEHRBACH & NALY, Wlnona, Minn., have the contract for installing the heating system in the new Roman Catholic Church at Arcadia, Minn.

THE SMITH & THAYER COMPANY of Boston, Mass., will supply the heating apparatus and O'Toole Bros. of Clinton, Mass., have the contract for the plumbing in St. Mary's Hospital at Clinton.

HENRY TINKLEBAUGH of Litchfield, Ill., bid \$1475 and secured the contract for heating the Fifth Ward School Building in that town.

THE HENDERSON PLUMBING COMPANY, Henderson, Ky., have the contract for installing the heating apparatus in the Henderson Sanitarium at their bid of \$1164.

THE Board of Selectmen of Webster, Mass., have appointed Nelson B. Johnson and James E. Crowley Plumbing Inspectors.

HOFFMAN, BROWN & WILSON of Circleville, Ohio, have secured the contract for plumbing the fine residence of Senator T. W. Marchant at Washington and for heating and ventilating the Presbyterian Church at Greenfield at their bid of \$3000, and they will do the plumbing in the Methodist Church in the same town, to cost \$1600.

JOHN M. BRUCE, secretary of the Engineering Review Company, will resign that position on August 25 to accept the treasurership of the Judson A. Goodrich Company, manufacturers and jobbers of high grade Steam Specialties at 105 Beekman street, New York. Prior to his connection with the Engineering Review Company Mr. Bruce was for eight years New York salesman for Bruce & Cook.

THE AMERICAN RADIATOR COMPANY, Chicago, are calling attention to their Zenith Flue Radiators with box base for direct-indirect heating, which have been used in some of the largest buildings of all the principal cities.

FRANK J. HEARNE, president of the National Tube Company, has retired from that position. Vice-President William B. Schiller has been selected to succeed

Mr. Hearne, whose resignation, it is stated, is caused solely by a desire to resign active business cares, in which he has been engaged for the past 36 years. Mr. Schiller has long been identified with the Tube business and is known as an expert therein. His place as first vice-president will be filled by W. H. Latshaw, now second vice-president. Mr. Latshaw is succeeded by John D. Culbertson, who has been treasurer of the company, and A. S. Matheson has been elected third vice-president.

#### New Firms and Changes.

W. BARGAMIN, formerly of the plumbing and heating firm of G. & A. Bargamin, 504 West Main street, Richmond, Va., has taken charge of the old stand, and will continue business as in the past.

B. F. THOMPSON has disposed of his interest in the tin and plumbing business of Thompson & Wood, Malone, N. Y., to his partner, E. J. Wood, who will continue under his own name.

PUTNAM & LA FOUNTAIN of Springfield, Vt., have purchased the plumbing business and hardware stock of J. T. Robbins at Charleston, N. H., and will open in the Dodds Building on Main street.

ENOS W. THAYER of Meredith, N. H., and B. W. Cooley are interested in the organizing of a company to manufacture Faucets and similar goods at Antrim, N. H.

THE S. C. LOWE SUPPLY COMPANY, New Bedford, Mass., have been incorporated under the laws of New Jersey, with a capital stock of \$100,000, of which \$1000 has been paid in. The incorporators are Stephen C. Lowe, Thomas C. Lowe and Charles A. Bowen. The company will deal in Plumbing Materials.

#### Three-Way Valves.

The Clayton & Lambert Mfg. Company, Detroit, Mich., observe that there are many ways of doing things,

Fig. 1.—Valve without Dial. Fig. 2.—Valve with Dial.

#### Three-Way Valves.

but that they themselves have adopted one way which they believe to be the best. The company, however, make valves for devious ways and the illustrations given herewith show their new three-way valves, with and without dials. These valves are adapted for use by gas and gasoline engine makers, automobile manufacturers and others. They are made out of the best quality of close grained red valve metal, and the reputation of the manufacturers assures the workmanship being of the best. The company issue a circular and price-list giving full description of these valves.

#### Whipple Gives Children an Outing.

It has been the custom of William L. Whipple, one of the stove dealers and plumbers of Providence, R. I., to kindly remember the little folks of the Grace Memorial Home with a sleigh ride in the winter season and an outing in the summer. On August 14, through his kindness, the children of the Home, 35 in number, accompanied by Miss Mary Todd, matron, were given an outing in Roger Williams Park. The children were taken in two large wagons, and alighting in the fine grove on the border of the lake, a visit was made to the menagerie and the merry-go-round. Luncheon was served later in the afternoon under the trees. The party returned from the park about six o'clock in the evening. The Grace Memorial Home is a day nursery where children are cared for while their parents are employed, the children being left in the morning and called for at night.

## The Tin Plate Situation.

Conflicting accounts have appeared in the daily press concerning the attitude of the tin plate workers to the proposition of the American Tin Plate Company, which contemplated co-operation between the mills and the men to secure a part, at least, of the drawback tin plate business. As we understand it the situation is this:

As early as three years since conferences took place between the tin plate manufacturers and the officials of the Amalgamated Association looking to the development of some plan by which there could be secured to American mills the work of manufacturing those tin plates which are imported by canners, oil refiners and others and are re-exported under the drawback clauses. Finally this year the officers of the association unanimously assented to a proposition that the men accept a reduction of 25 per cent. from the scale of wages which is in force for domestic tin plate, to be applied exclusively to the drawback plate production. These negotiations were kept quiet, and when the proposition was finally submitted to the lodges for a vote the local officials of the American Tin Plate Company and the officers of the Amalgamated Association were relied upon to fully explain the scope and aims of the movement. It appears that in this they were not generally successful since many of the members of the labor union believed that there was behind the proposition some ulterior motive inimical to their interests. As we understand it, a two-thirds vote of the lodges was necessary to carry the measure. This was not secured. Some of the reasons for this failure should be stated in order to reach an understanding of subsequent events.

Many of the men being Welshmen have been influenced by the pleadings of their fellow workmen in Wales with whom they appear to carry on an active correspondence. They were induced to vote adversely on the ground that they would be taking the bread out of the mouths of their fellows in the old home.

It appears, too, that the impression got abroad that if these propositions were rejected it would affect principally the smaller mills, since they would be the ones to close down from a scarcity of work. The men of the larger mills concluded that the matter therefore did not interest them directly and on general principles voted against the proposals of the American Tin Plate Company.

Finally the independent mills were a factor in the situation. The owners and managers of the majority of them, under the impression that in some way the new arrangement would work adversely to them, did all within their power to secure a negative vote in the lodges connected with their plants.

There is no evidence to show that there has been a change of heart among the Welshmen, but it is quite clear that the men of the larger mills now view the situation differently. One of the mills belonging to this class has reconsidered the adverse action taken and has voted in favor of acceptance.

While the managers of one of the most important independent plants have from the first given the movement their cordial support, the officers of at least one mill who worked against it have now changed their attitude after a frank discussion of the matter.

At the present time the lodges are reconsidering the vote taken and it is possible that the necessary majority may yet be secured.

It may be well to note that the workmen have not alone been called upon to bear the burden of what sacrifices are necessary to secure the work of producing the drawback plates required in this country. The sellers of raw materials and of supplies have also agreed to make prices which will contribute to bring about a favorable result. Nor is the drawback tin plate business alone at stake, amounting, as it does, from 1,250,000 to 1,500,000 boxes annually. It is believed that a good share, notably of the Canadian tin plate business, estimated at about 400,000 boxes annually, may be secured and the hold be strengthened on the Pacific Coast and Alaska business.

The American Tin Plate Company have in the past secured a certain amount of the drawback plate con-

sumption, but at sacrifices which were impossible to bear any longer, and which would have been utterly out of the question when dealing with the whole trade.

If the final vote should be adverse the American Tin Plate Company will be under the necessity of keeping a part of their capacity idle. Since there has been a considerable growth of the capacity of the independent mills, the possible output of all the works of the country is considerably in excess of the domestic requirements. It is not to be supposed that the dominant consolidation will, in the long run, look with indifference upon the growth of the outside works and there is thus a possibly distant prospect of close competition for the domestic market which may be reflected in a declining tendency in wages. The acquisition of the drawback plate business would put eventualities of this kind at rest for the future and would secure not alone to the tin plate workers but to the makers of the raw materials an important amount of work at wages adequate under the circumstances.

The exact methods by which the drawback business would be segregated from the domestic business and the wages be determined have not been discussed, but we understand that assurances satisfactory to the officers of the Amalgamated Association on this point have been given.

## The Sykes Steel Window.

The Sykes Steel Roofing Company, sheet metal contractors, of Chicago, are making a fire proof window, composed of galvanized iron or sheet copper and wired glass. The frame is hollow, so as to provide for an air

*The Sykes Steel Window.*

chamber. The company make either a window with a pivoted sash, as illustrated herewith, or a sliding window. The underwriters' associations are accepting these windows in place of the ordinary wood window with the fire shutter, which makes a great economy in the construction of the building. Besides this the window has a great many advantages over the ordinary wood window and fire shutter, inasmuch as the window is always in position, while fire shutters have to be closed. Frequently, when a fire happens in the day time there is not the time, or the employees or those who have charge of the matter forget to close the shutters. Consequently, fire in an adjoining building often enters and does great damage. The labor saved in the opening and closing of the shutters alone is considerable.

The fire will crack the wired glass, but it will stay in position. In numerous instances, it is claimed, fires have been confined to one building through the use of these fire proof windows, where otherwise a great deal of damage would have been done. This was particularly illustrated when the Armour glue factory burned down at the Union Stock Yards in Chicago, when the curled hair building stood within 20 feet of it and the fire was confined to the glue works on account of these fire proof windows. The Sykes Steel Roofing Company, 611 South Morgan street, Chicago, Ill., will be glad to furnish information to any who are interested in these windows.

## PATTERN FOR VENTILATOR BREAST.

**PROBLEM.** Where a fluted, flared breast, whose outline is a true circle, intersects a cylinder, to find the pattern for the fluted breast.

A correspondent at Hazleton City, Pa., asks that the method of obtaining a correct pattern for a flared breast for a ventilator, such as is shown in Fig. 1, be given in *The Metal Worker*.

The first step necessary is to correctly draw a plan and elevation, as is shown in Fig. 2. Draw any center

Pattern for Ventilator Breast.—Fig. 1.—Perspective View of Ventilator Breast.

line, as R B; and, using any center point, as C on that line, with a radius equal to the half diameter of the ventilator, describe the semicircle D E F. Place the horizontal width of the breast in plan, as shown by F G, and with C as center and G C as radius describe the semicircle G H I, which divide into as many parts as this sort of breast is to have flutes—in this case, eight.

Fig. 2.—Plan, Elevation and True Curve.

From these eight divisions draw lines toward the center C intersecting the inner semicircle D E F, as shown.

Directly above the half plan construct the half elevation. Draw J K O R, which shows the ventilator pipe. Locate the point P on R J so that R P will be the vertical height of the breast. At right angles to R J draw P M, making it equal to the diameter of the larger semicircle in plan. Parallel to the center line R B and

from the intersections H a b c and I erect lines intersecting M P at M a' b' c' and P respectively. In similar manner from the intersections E, j, i, h and D in the plan erect perpendicular lines, intersecting the top of the breast at O, j', i', h' and R respectively. Draw lines from O to M, j' to a', i' to b' and h' to c'. Establish at pleasure the depth of the flute in elevation, measuring downward from the point M, as at e, and draw the line parallel to M P, as shown by e f. This line will represent the depths of the flutes at their center points between the lines H a, a b, b c and c I in plan, as at 4, o, n and m. From 4, o, n and m, and parallel to R B erect lines intersecting the line e f at 4v, o', n' and m' respectively. Trace free hand curves through the points M, 4v a', a' o' b', b' n' c' and c' m' P. This represents

Fig. 3.—Diagram of Triangles.

the true half elevation of the breast at the bottom of the flutes.

The next step is to obtain the true curve on 2 4 6 in plan. Extend the lines P M and f e in elevation, as shown by P S and f T. On M S place the stretchout of 2 4 6 in plan, as shown by 2' 4' 6'. At right angles to 2' 6' and from 4' drop a line intersecting the line f T at 4". Then trace a free hand curve through 2' 4' 6', as shown, which is the true curve on 2 4 6 in plan. In this case the curve 2 6 in plan is divided into two parts, but in practice more spaces must be used. From the point 4 draw a line toward C intersecting the ventilator pipe at 3.

As the pattern will be developed by triangulation a set of triangles will be constructed, as shown in Fig. 3, in which draw any horizontal line, as A B, upon which place the stretchout of 1 2, 2 3, 3 4, 4 5 and 5 6 in plan in Fig. 2, as shown by similar numbers on the line A B in Fig. 3. At right angles to A D and from the points 1 and 3 erect lines equal in height to N O in elevation in Fig. 2, as shown by 1' 5' and 3' in Fig. 3. Draw lines from 1' to 2 or 5' to 6 and 3' to 2, which will represent respectively the true lengths on 1 2, 5 6 and 3 2 in plan

Fig. 4.—One-quarter of Full Pattern.

in Fig. 2. In similar manner at right angles to A B in Fig. 3, and from the point 4 draw the line 4 4' equal in height to 4' 4" in true curve in Fig. 2. Draw lines in Fig. 3 from 3' to 4' and 4' to 5', which will represent respectively the true lengths on 3 4 and 4 5 in plan in Fig. 2.

For the pattern proceed as follows: Draw any vertical line, 1 2, in Fig. 4 equal in length to 1' 2 in Fig. 3 or O M in elevation in Fig. 2. With 1 3 in plan as radius, and 1 in Fig. 4 as center, describe the arc 3, which intersect by an arc struck from 2 as center and 2 3' in Fig. 3 as radius. Now with 2' 4' in the true curve in Fig. 2 as radius, and 2 in Fig. 4 as center describe the arc 4, which intersect by an arc struck from 3 as center and 3' 4' in Fig. 3 as radius. Now, with 3 5 in plan as radius in Fig. 2 and 3 in Fig. 4 as center draw the arc 5, which intersect by an arc struck from 4 as center and 4' 5' in Fig. 3 as radius. Then using 4' 6' in the true curve in Fig. 2 as radius and 4 in Fig. 4 as center, describe the arc 6, which intersect by an arc struck from 5 as center and 5' 6 in Fig. 3 as radius. Trace a line through the intersections thus obtained in Fig. 4; then

will 1 5 6 2 be the pattern for one flute. As many flutes can be joined together as desired. In Fig. 4 four are shown, thus making A B C D one-quarter of the full pattern. Slight bends are required along the lines shown by the small dots, so that A B will form to the shape of the ventilation pipe F E D in plan in Fig. 2, and each of the flutes, as 2 6 in Fig. 4, will take the shape of the true curve in Fig. 2.

### The Quality of Galvanized Sheets.

In assigning a cause for the oxidation of galvanized iron sheets, it is necessary, says the London *Ironmonger*, to look a little further than the bars which form the basis of manufacture. It is sometimes assumed, all too hastily, that oxidation is due to the use of acid steel bars in the production of the black sheets. That, however, is not necessarily the case. Acid bars are used in several works where sheets rarely, if ever, go wrong. The cause of the trouble, generally speaking, is defective drying. Unless the sheets are dried thoroughly before they are packed they are apt to sweat considerably on the voyage, especially in tropical seas, and the moisture thus produced sets up the chemical reaction which produces oxidation. The trouble is sometimes accentuated by inefficient pickling. Unless the black sheets are pickled until they are clean almost to whiteness it is next to impossible to give them a satisfactory coating of spelter. The sheet may become covered well enough to pass superficial inspection, but on being subjected to fluctuations of temperature the unequal expansion of the iron and the spelter causes the latter to blister and eventually to peel off. The susceptibility of the sheets to corrosion is thereby much increased. Yet another contributory cause is defective annealing. If properly annealed the sheets when galvanized will stand any amount of handling without the slightest risk of damaging the spelter. If they are not so annealed the spelter is apt to crack and chip on being subjected to the rough usage of the warehouse and the quay. It will thus be seen that the primary cause of oxidation in galvanized sheets is scamping in the workshop. This in turn may be due to the employment of unskilled men, or—as is more often the case—to the cutting of prices.

The paradox that cheap things are dearest holds good especially in the case of galvanized iron sheets. If they are to be good and of durable quality they cannot be made "cheaply." If the price is to be cut, some process in their manufacture must necessarily be slurred over or omitted. Some makers leave out the annealing and thereby save about 10 shillings per ton, without affecting the appearance of the sheets. Sheets which have not been annealed look very much the same, when galvanized, as those which have. The spelter on such sheets, however, suffers considerably during the corrugating process, the pressure required being almost enough to cause it to disintegrate. Sheets produced in this way are difficult to fix. They are apt to warp, and even when quite flat they cannot be easily adapted to uneven supports. A more serious trouble, however, is that they are not durable, and are rapidly affected by exposure to the air. Another false economy is to stint the spelter. Here, again, a few shillings can easily be "economized" in the cost of manufacture, but the consumer pays dearly in the long run for the accommodation. Even when such "scamping" manufacturers have done their worst there is only a difference of a few pence per sheet between the price of their stuff and that of the highest qualities of galvanized sheets produced in the trade. Yet it is just those few pence which often determine where an order shall be placed.

A perfect sheet must be annealed, pickled, dipped and dried. Each process must be carried out thoroughly and the best available materials must be employed. If all this has been properly done the crystallization appears as a beautiful white pattern on a deep blue ground. Such a sheet will remain bright and fresh for an almost indefinite period, and it will outlive three or four inferior sheets.

THE NATIONAL FIRE PROOFING COMPANY suffered a \$25,000 loss by fire last week at their plant at Niles, Ohio. Much valuable machinery was destroyed.

### PERFECTED GRANITE ROOFING.

A very attractive catalogue which has recently been issued by the Eastern Granite Roofing Company, with offices in the Gerken Building, Chambers street and West Broadway, New York City, describes in admirable style the variety of uses to which their products are adapted. The company make the important claim that they have the original stone surfaced roofing, which is scientifically made by skilled workmen on especially constructed machinery. Every roll of roofing is rigidly inspected before leaving the works, so as to meet in every respect the claims made for it. The company point out that the material which they are furnishing is well adapted for covering old shingle roofs, its pliability permitting it to so conform to the shingles as to render it practically impossible to notice the old roof underneath. The claim is also made that where their perfected Granite Roofing is used water which may collect on the roof is not tainted in any way and can therefore be used for household purposes. Reference is also made to the fire resisting qualities; and it is stated that trimmings covered with the roofing are rated by insurance companies the same as those covered with tin or gravel roofing. The company have enjoyed a large business the present year and a short time ago found it necessary to add new equipment and otherwise improve their manufacturing facilities. They now have a very large capacity for making granite roofing and are in a position to promptly fill all orders with which they may be intrusted. The catalogue above referred to is illustrated by means of full page half-tone engravings, while the text sets forth the merits of the company's productions.

### A Humanitarian Suggestion.

A manufacturer who employs a great many presses reports a curious accident. A pile of blanks ready to be drawn, standing alongside of the press, fell over while the operator happened to have his hand under the die, and these blanks fell on the treadle, releasing the clutch, causing the punch to descend on his hand. This occurrence suggests the desirability of putting a wooden box around the treadle or a shelf over it, in such a way that if anything falls it will not hit the treadle, leaving room, of course, between the treadle and the top of the box for the foot. This idea, suggested by the occurrence, may be worth the consideration of those of our readers who are operating similar machinery.

### FLASHINGS.

JAMES A. MATHEWS, formerly manager of the Crescent Tin Plate Company of Cleveland, Ohio, has become the manager of the real estate department of the Guardian Trust Company of that city.

JOHN HENRY of Carnegie, Pa., who was the general manager of the Chartiers Iron & Steel Company, before their absorption by the American Sheet Steel Company, was killed on August 16 by a train at the Fourth avenue station of the Pan Handle Railroad in Pittsburgh. Mr. Henry was struck by the train while attempting to cross the tracks and died at the Mercy Hospital as a result of his injuries. Mr. Henry was on his way to start for a vacation trip to Michigan and was trying to catch his train at the time the fatal accident occurred.

To keep pace with their rapidly increasing business, Knisely Brothers, 99 Bunker street, Chicago, manufacturers of Sheet Metal Windows, are building a two-story structure, 226 x 126 feet, at Twenty-eighth street and Fifth avenue, to cost \$40,000. The company expect to move into their new quarters about September 15.

GROUND has been broken at Canton, Ohio, for the plant of the United Steel Company, mention of which enterprise has already been made in this paper. The plant will include three open hearth furnaces and a rolling mill. The latter will be a 34-inch mill and its output will be Universal Plate, Skelp and Tin Bars. The main building will be 100 x 400, and a second building will be 55 x 100. The company have secured 5 acres of ground and the plant is designed so that it can be duplicated at any time. Contracts have been placed with the

Fort Pitt Bridge Company of Pittsburgh for the structural material and erection.

THE plant of the International Metal Lath Company, Niles, Ohio, was last week destroyed by fire. The loss will reach \$25,000.

THE DOUBLE TRUSS CORNICE BRAKE COMPANY, 1453 Niagara street, Buffalo, N. Y., are sending out an eight-page circular illustrating and describing their Double Truss Cornice Brake for bending and forming sheet metal, also their Electric City Gutter Former, both of which machines have been illustrated and described in our columns. A long list is presented of concerns all over the country who are using these machines.

THE FRED. J. SWAINE COMPANY, St. Louis, Mo., report their factory well filled up with enough orders for Presses, Dies and other special Machinery to keep them busy for some time to come. The company's new factory at Seventh and O'Fallon streets is well under way, and they expect to have it ready for occupancy about September 1. The plant will be thoroughly up to date in every respect, and equipped with all the latest and most modern appliances.

THE CLARK NOVELTY COMPANY, Rochester, N. Y., are sending out their 1902 catalogue devoted to the Clark kerosene oil system of heating tools and furnaces for different kinds of mechanical work. The apparatus consists of an air compressor, a compressed air tank, an oil tank and piping to bring a jet of air and oil to a mixing chamber, where it is heated to burn with a flame of intense heat in a furnace constructed to suit the work in hand. This system has been used by canned goods packers, tinware manufacturers and cornice makers, where a large number of workmen are using hot soldering coppers. The catalogue gives full description of the various apparatus and the burners. It also shows forges for the use of steel workers or braziers.

J. H. FULMER, Nazareth, Pa., is distributing a neat little booklet illustrating and describing some of his specialties. These include the Eagle and Eureka Snow Guards, also the Fulmer Wire Snow Guard, which is his latest production. Mr. Fulmer makes a line of Slaters' Tools, including Hammers, Rippers and Stakes; also the Universal Slate Puncher and Shaper, which is equipped with sets of knives for cutting Slates into any shape desired, and the Star Slate Puncher.

MESKER BROS. of St. Louis, Mo., who are the contractors for the Galvanized Iron Cornice, Ceiling and the Tin Roofing of the new Opera House in Durango, Mexico, have the work well started, a good deal of the Cornice being in place and the roofing ready to lay. The work is in charge of Charles Carle. The job is a large one, and the class of work a pleasing innovation in building in that locality, both in the matter of decoration and utility. About 300 squares of Tin will be used in the roof. When completed the Opera House will cost \$500,000, Mexican.

THOSE in Galveston, Texas, who have roofing and sheet metal work to do, or are in need of Ventilators and Skylights, are likely to place their orders with H. C. Opperman, 1811 Market street, who is attracting attention to his facilities by sending out a very appropriately illustrated desk blotter that will be a continual reminder.

CHARLES MCSHERRY, manufacturer of Sheet Metal Working and Special Machinery, Pittsburgh, Pa., has been awarded the contract for nine Enameling Ovens for the plant of the General Fire Proofing Company, Youngstown, Ohio.

IT is reported that H. Adler & Co. of Pittsburgh, Pa., have concluded the purchase of 3 acres of land at Carnegie, Pa., from the John Dunlap Company, and will erect thereon a large Sheet Iron plant.

WAITE, RANLETT & Co., 80 Broad street, Boston, Mass., who are jobbers and dealers in Sheet Iron, Tin Plates, Sheet Copper and Metals, report an excellent seasonable demand in that territory.

A conference of the malleable iron founders was held at the Auditorium Hotel, Chicago, last Wednesday. Arrangements are being made for a combination of interests with a capital supposed to be between \$15,000,000 and \$20,000,000. Nothing tangible, however, has been accomplished.

## The Taylor Quick Adjusting Self Locking Clamps.

James L. Taylor, 30 Lawrence street, Newark, N. J., is offering the clamps shown herewith. In Fig. 2 a portion of the sliding head is cut away, showing the hardened oil tempered serrated steel gripping blocks, one of which is at the bottom of the bar and the other at the

Fig. 1.—The Taylor Clamp No. 10.

top of the bar in the rear part of the head. In a corresponding position, in the front part of the sliding head, is a V-shaped steel spring. The gripping principle is the same in all the clamps. The steel blocks are file tested and the serrated faces are milled in. The screws are of steel, and the seats on the stationary jaws are finished square and true with the bars, so that the clamps will grip the work true. The malleable portions of the clamps are made of air furnace refined malleable iron. The point is made that as there are no serrations

Fig. 2.—The Taylor Steel Bar Screw Clamp No. 20.

on the bars a much finer adjustment is obtained, and that the bars are not weakened. Clamp No. 10 is all of malleable iron, and is made in six sizes, to open from 3 to 12 inches. Clamp No. 20 has a steel bar, and is designed for use by cabinet, carriage, piano and pattern makers; also for furniture makers and repairers, &c. Clamp No. 25 is a steel bar carpenter's clamp, with a stationary head, in which the screw works. It is explained that the sliding heads can be instantly opened or closed the full length of the bars and yet are locked for clamping purposes wherever they are left. In operation the sliding head is opened wider than the work to

Fig. 3.—The Taylor Carpenter Clamp No. 25.

be clamped, the clamp is then placed in position; the pressure of one finger slides the head against the work when two or three turns on the thumb screw applies the power. The point is made that owing to the fact that the screws are not used in adjusting a much finer and more powerful thread can be used, and that the clamping action is positive, as the greater the strain the tighter the grip. All clamps are tested to over 1400 pounds clamping strain, it is stated, before leaving the factory.

The compilers of this year's city directory claim a population for Cleveland, Ohio, of 453,537, an increase of 23,400 over last year. Cleveland is rapidly becoming one of the great cities of this country.

Seventy-eight profit sharing enterprises, affecting 53,526 workpeople, were in operation in Great Britain last year.

It is claimed that an experimental balloon recently attained an altitude of 12 miles, recording a temperature of 80 degrees F. below zero, at Berlin.

## THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

### WHO MAKES FUEL OIL BURNERS?

Owing to the development of new oil fields and the higher prices of coal, due to the coal strikes, we are constantly receiving the inquiry, who makes burners suitable for use for crude and refined oils in hot air furnaces and steam and hot water boilers, and also for heating stoves for domestic use and kitchen stoves? We should esteem it a favor if any of our readers who have used such apparatus that has proved satisfactory would give us the address of the manufacturers or send us circulars showing these devices. If any special method of piping, placing or arranging these devices, has been discovered of special advantage we shall be glad to have these facts brought to our attention.

### A ROOF AROUND A TREE.

From J. N., Washington, D. C.—I am sorry you have not been able to evoke an answer from some one to my inquiry in *The Metal Worker* of August 2 as to the best way of making a roof tight around a tree. While I am still open for suggestions, I will admit that I do not like my original plan as well as an idea I got a few days ago. I propose to make a casing of galvanized iron from the floor of the room to 6 inches above the roof and give the tree 3 inches play all around at the top. The casing will be made in halves, bolted together, covered with expanded metal and plastered and papered like the rest of the room. This will be an improvement in many ways over my old plan, and the extra room it takes up will be more than offset by the appearance, while promoting the health of the tree. This is such an unusual job that I should like to hear from others on the subject.

### BURSTING SEAMS IN GUTTER.

From J. P. F., Hartford, Conn.—I have noticed the article in the Letter Box of August 9 regarding the bursting of seams in gutters. My comment on the same would be that there is a great deal more construction and expansion in copper than in any other metal. Your suggestion as to soldering the seams is good. I have had an experience of 20 years in general roofing work, and have been a close observer.

### WANTS REPAIRS FOR TOBASCO GASOLINE FURNACE.

From John J. Higinson, Jr., Nyack, N. Y.—I desire to learn where I can secure repairs for the Tobasco gasoline furnace having a double burner. It was manufactured by the D. M. I. Mfg. Company of Detroit, who sold out to a concern in Rochester, N. Y., but I am unable to locate them, and shall be glad if some reader of *The Metal Worker* can give me the desired information.

### INDIVIDUAL VERSUS CENTRAL STATION HEATING SYSTEMS.

From J. H., Berlin, Ont.—Can you inform me of the approximate cost of heating a house of standard size from the central station heating system as compared with heating a house with a separate plant?

Note.—We shall be glad if those of our readers who have had experience in such problems will give their views for the benefit of this correspondent. For his information, we would say that it is a custom with companies who operate central station heating systems to charge from 15 to 25 cents per square foot of radiation per season, according to the cost of fuel in the locality where the plant is operated. In laying out steam heating plants it is the custom with some to calculate that 1 square foot of radiation will heat from 40 to 50 cubic feet of space in a building of good construction. With

this information it is probable that our correspondent can reach an approximate conclusion.

### A QUESTION FOR PLUMBERS.

From D. & E., Jackson, Miss.—We should be glad if the experienced plumbers who read *The Metal Worker* will give us their views as to the plumbing devices

A Question for Plumbers.—Fig. 1.—Specially Constructed Drum Trap with Vent and Cover.

shown herewith. Fig. 1 shows a drum trap which has a special vent connection, as shown in Fig. 2, and Fig. 3 shows the application. It is a combination cleanout cover and vent coupling adapted for use in connection

Fig. 2.—View of Vent and Cover.

with lead drum traps. As both traps and the ventilation of them have been discussed in *The Metal Worker*, doubtless some of the readers may have views as to whether this method of constructing a trap and connecting it in

Fig. 3.—Showing Application of Trap.

a plumbing system is in accordance with the latest sanitary rules.

### PATTERN FOR AN OBLIQUE FUNNEL BOTTOM.

From Subscriber, Camden, Ind.—I would like to learn how to lay out the pattern for a funnel bottom for a round can, the point of the funnel being directly under the side of the can.

Answer.—The method of making the pattern for this, which is the frustum of a scalene cone, is described in Problem 167 in "The New Metal Worker Pattern Book."

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** is very quiet, and prices are somewhat irregular.

**Copper** has declined in price, and continues very dull.

**Pig Lead** is quiet and firm.

**Spelter** continues scarce, and rules about  $\frac{1}{4}$ c. higher for spot.

**Antimony** is dull and weak.

**Nickel** is in fair demand at unchanged prices.

**Aluminum** is firm and in good demand.

**Tin Plates** are very dull, and without quotable change in price.

**Black Sheets** are dull and a shade lower.

**Galvanized Sheets** are rather firmer, but in light demand.

**Scrap Iron** is very active and considerably higher.

**Scrap Brass and Copper** are weak and dull.

**Scrap Zinc** is  $\frac{1}{4}$ c. higher.

**Foundry Iron** continues extremely scarce, with prices normal.

**Sheet Copper** is in fair demand, and firm in price.

**Sheet Zinc** is moderately active and very firm.

**Hardware** is active for the season, with prices strong in almost all lines.

**Plumbers' Supplies** are active, and prices rule firm.

**Wire Nails** are in fair demand, with prices well maintained.

**Cut Nails** are unchanged.

**Wire** is in better demand, and prices are firm.

**White Lead** is quiet, with prices unchanged.

**Linseed Oil** has declined 7c. per gallon.

**Spirits Turpentine** is more active, and  $\frac{1}{2}$ c. per gallon lower.

## METAL MARKET.

NEW YORK, August 22, 1902.

**Tin.**—At the end of last week a little better demand was developed in the Tin market here, and wholesale prices were pushed up to 28 $\frac{1}{2}$ c. for spot stock. The London market followed with a sharp upward movement. Since that time prices have again sagged, both here and there to about the figures given in our last report and the market has relapsed into dullness. At the close the market was rather irregular. Jobbers quote Straits Pig in small lots from 29c. to 29 $\frac{1}{2}$ c. per lb. The arrivals so far this month aggregate 2969 tons and will probably reach 3200 tons for the entire month.

**Copper.**—The Copper market has continued extremely dull and uninteresting throughout the week with prices seeking a lower level. Exports have fallen off considerably, amounting to about 5000 tons this month. A decidedly weak tone characterized the market for Copper at the close. Consumers have been limiting their purchase to small quantities for immediate requirements and are waiting further developments in the market. Jobbers' prices have been reduced about  $\frac{1}{2}$ c. Lake Ingot in small lots is now quoted at 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c. per lb., and Casting Copper at 12 $\frac{1}{4}$ c. to 12 $\frac{3}{4}$ c.

**Sheet Copper.**—A fairly active demand for Sheet Copper continues and the outlook is regarded as favorable for a good business in the near future. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—The market is entirely without change here. The volume of business is of moderate dimensions and prices remain firm. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices report that the Lead market at that center is showing no particular activity, prices being well maintained.

**Spelter.**—The market for this metal maintains its firm tone. Spot is still very scarce and prices have ad-

vanced. Jobbers quote good Western brands in small lots at 6 $\frac{1}{2}$ c. to 6 $\frac{3}{4}$ c. per lb. St. Louis advices indicate that all of the offerings in the Spelter market there have been well taken and a marked scarcity of any spot material is noted. Prices rule strong.

**Sheet Zinc.**—The demand for Sheet Zinc is of the usual proportions, and prices are firm and unchanged at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—No change is noted in this metal, except that prices are hardly as firm as formerly. Cookson's, in small lots, is quoted at 10c. to 10 $\frac{1}{4}$ c. per lb., Hallett's at 8 $\frac{3}{4}$ c. to 8 $\frac{1}{2}$ c. and U. S. at 8 $\frac{1}{4}$ c. to 8 $\frac{1}{2}$ c.

**Nickel.**—No change is noted in this metal, retail quotations ruling at about 55c. to 60c. per lb. for small lots.

**Aluminum.**—The demand for Aluminum continues active and prices remain at their former level, small lots of No. 1 Ingot, guaranteed 99 per cent. pure, being quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market is without any new features. The consumptive demand is tame and prices show no quotable change. The American Tin Plate Company are quoting for delivery up to December 1 on the base price ruling for the past year or more. Stocks are understood to be ample to meet all requirements, and the closing down of so many mills is likely to head off any possible surplusage of Plates. There is some irregularity in prices, but jobbers have not changed their quotations, which rule at about \$4.70 to \$4.90 per box for American Bessemer Coke Plates, I. C., 14 x 20, in moderate sized lots, delivered at New York or corresponding points.

**Sheets.**—The market for Black Sheets is extremely quiet, with almost entire absence of inquiries for large lots. Heavy Sheets are moving in better volume than the lighter gauges, which are quite a drag upon the market. Galvanized Sheets seem to be a trifle firmer, and there is not so much talk of cutting. The manufacturers claim that there is now absolutely no profit in galvanizing, as the differential between Coated and Black Sheets is less than formerly, while the price of Spelter is much higher. Stocks in jobbers' hands are ample to meet all the current requirements, and prices have not the same stiffness that characterized them a while back. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets, in small lots, at 3.60c. to 3.65c. and No. 27 Galvanized Sheets at 4.45c. to 4.60c.

Chicago advices are as follows: No new features have been developed, supplies being more than ample to meet the moderate demand. Quotations are as follows: No. 27 Black Sheets, in small lots from store, 3.45c. to 3.55c. Galvanized Sheets, in small lots from store are sold at 4.55c. to 4.65c. for No. 27.

**Old Metals.**—The market for Scrap Iron is very active. Consumers are taking about all the material that is offered, and prices have stiffened. Scrap Brass and Copper have weakened, in sympathy with the decline in raw Copper. Scrap Zinc is higher and very firm. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                                        |                            |
|----------------------------------------|----------------------------|
| Heavy Copper.....                      | per lb. 10 c.              |
| Light and Tinned Copper.....           | per lb. 9 c.               |
| Heavy Brass.....                       | per lb. 8 c.               |
| Light Brass.....                       | per lb. 6 $\frac{1}{2}$ c. |
| Lead.....                              | per lb. 3 $\frac{3}{4}$ c. |
| Tea Lead.....                          | per lb. 3 c.               |
| Zinc.....                              | per lb. 3 $\frac{1}{2}$ c. |
| Pure Aluminum Sheet.....               | per lb. 22 c.              |
| Cast Aluminum.....                     | per lb. 17 c.              |
| No. 1 Pewter.....                      | per lb. 18 c.              |
| No. 2 Pewter.....                      | per lb. 9 c.               |
| Tin Plate Scrap, per gross ton.....    | to \$5.00                  |
| Wrought Iron Scrap, per gross ton..... | \$15.00 to 15.50           |
| Heavy Cast Scrap, per gross ton.....   | 13.50 to 14.00             |
| Stove Plate Scrap, per gross ton.....  | 10.00 to 10.50             |
| Burnt Iron, per gross ton.....         | 8.00 to 8.50               |

THE INTERNATIONAL MICA MFG. COMPANY of Columbus, Ohio, will, it is reported, build a large plant at Huntington, Ark.

THE PIG IRON MARKET.

NEW YORK.—The market in this district is not particularly active so far as domestic Pig Iron is concerned. Founders generally are not buying much for extended delivery, because there is due to them a good deal of Pig Iron on old contracts of which a considerable tonnage must go over to next year. The Anthracite strike contributes to this greatly. It must also be noted that consumers close to tidewater have foreign material to fall back upon. There have been considerable sales of foreign Pig in the earlier part of the week under review. Spot Iron is difficult to quote. Small lots of No. 2 Lehigh have changed hands at \$23 to \$24, tidewater. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity, No. 1 Foundry, \$22.25 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$21 to \$21.25.

CHICAGO.—The Coke famine has assumed a most serious aspect for furnaces in this section. Several Northern furnaces are already banked and others expect to be compelled to do likewise in the course of a few days. This is the most prominent feature of the Pig Iron situation. The demand for next year's delivery continues without any perceptible decrease, many of the smaller consumers being in the market for various amounts ranging from 500 to 1000 tons, with one or two sales for larger quantities. The urgency of consumers' wants for quick shipment Iron is more than ever evident. Single car lots of Southern Iron have been sold at \$27.15 for No. 1 and \$26.65 for No. 2. With the exception of some 100-ton lots of No. 3 Foundry on the basis of \$17, Birmingham, sales of Southern Iron for next year's delivery have been inappreciable. The following are the prices current for the first half of 1903:

|                                         |                    |
|-----------------------------------------|--------------------|
| Lake Superior Charcoal.....             | \$26.00 to \$27.00 |
| Local Coke Foundry, No. 1.....          | 22.50 to 23.00     |
| Local Coke Foundry, No. 2.....          | 22.00 to 22.50     |
| Local Coke Foundry, No. 3.....          | 21.50 to 22.00     |
| Local Scotch, No. 1.....                | 23.00 to 23.50     |
| Ohio Strong Softeners, No. 1.....       | 25.00 to 26.00     |
| Southern Silvery, according to Silicon. | 22.60 to 23.00     |
| Southern Coke, No. 1.....               | 21.90 to 22.40     |
| Southern Coke, No. 2.....               | 21.15 to 21.65     |
| Southern Coke, No. 3.....               | 20.65 to 21.15     |
| Southern Coke, No. 1 Soft.....          | 21.65 to 22.15     |
| Southern Coke, No. 2 Soft.....          | 21.15 to 21.65     |

PHILADELPHIA.—The market is rather quiet, but considering that everything that is available or likely to be available until about midsummer of next year is already taken up it is not surprising that there is but little doing. Buyers are very anxious, however, and whenever the opportunity for placing an order can be found it is promptly accepted. The situation has been greatly relieved by the steady arrivals of foreign Iron, and many foundries and shops would have been shut down long ago, but for foreign Iron, and as it is there is a constant struggle to get enough of the best makes to keep things moving. For the present Middlesboro Irons may be quoted at about \$19.50 for cargo lots, or for small lots delivered in consumers' yards \$21 to \$21.50; Scotch Irons, according to brand, \$22 to \$24. American Irons as follows, for city or nearby deliveries during the first half of next year (with a premium of \$1 to \$1.50 per ton on this year's deliveries):

|                      |                    |
|----------------------|--------------------|
| No. 1 X Foundry..... | \$23.50 to \$24.50 |
| No. 2 X Foundry..... | 22.00 to 22.50     |
| No. 2 Plain.....     | 21.00 to 22.00     |

PITTSBURGH.—The situation is much complicated by the Coke famine, caused by lack of transportation, and many of the Valley furnaces have had to bank down. There is scarcely any Iron to be had for this year's delivery. Small lots of No. 2 Foundry have sold at \$24 and \$25. Many Northern and Southern furnaces are out of the market on Nos. 1 and 2 Foundry for next year, but No. 3 can readily be bought. About 10,000 tons of Southern Foundry have been sold in this market in the past week. The last No. 2 went at \$18, Birmingham, or \$22.15, Pittsburgh, while No. 3 can be bought at \$16.50, Birmingham, or \$20.65, Pittsburgh. Northern No. 2 Foundry is \$22 to \$22.25 for next year.

CINCINNATI.—There is still some Iron selling for the first half of 1903, but the total amount is not large and made up of sums of 500 tons and less. The market is a little bit stronger and the amount of Iron which is being offered on the basis of \$17.50 for No. 2 Foundry, Bir-

mingham, is much smaller than it has been. There is a stiffening tendency and \$18 and even \$19 for the same grade is being freely talked. Northern Iron is selling more freely for next year's delivery because the furnaces are not yet so well sold up as those of the South. The amount of Iron selling for delivery within the next 60 days, especially Foundry grades, is inconsequential. We quote, f.o.b. Cincinnati, for 1902 delivery, as follows:

|                                |                    |
|--------------------------------|--------------------|
| Southern Coke, No. 1.....      | \$24.25 to \$26.25 |
| Southern Coke, No. 2.....      | 23.75 to 25.75     |
| Southern Coke, No. 3.....      | 23.25 to 25.25     |
| Southern Coke, No. 4.....      | 21.25 to 22.00     |
| Southern Coke, No. 1 Soft..... | 22.75 to 26.25     |
| Southern Coke, No. 2 Soft..... | 22.25 to 25.75     |
| Southern Coke, Gray Forge..... | 20.25 to 20.75     |
| Southern Coke, Mottled.....    | 20.25 to 20.75     |
| Ohio Silvery, No. 1.....       | 26.10 to 26.60     |
| Ohio Silvery, No. 2.....       | 25.85 to 26.10     |
| Lake Superior Coke, No. 1..... | 26.10 to 26.60     |
| Lake Superior Coke, No. 2..... | 25.60 to 26.10     |
| Lake Superior Coke, No. 3..... | 25.10 to 25.60     |

CHICAGO REPORT.

Scrap Iron and Steel.—The offerings have been light, and there being a good outlet for dealers the market has gained in strength, and higher prices have been paid for Machinery Cast, Stove Plate, Grate Bars, Sheet Iron and Hoops, Plow Steel, Breaking Stock and Horseshoes. The following are the prices paid by dealers in carload lots, Chicago:

|                                                        | Per net ton.       |
|--------------------------------------------------------|--------------------|
| Country Wrought Scrap.....                             | \$15.00 to \$16.00 |
| Machinery Cast.....                                    | 14.00 to 14.50     |
| Malleable Cast.....                                    | 12.00 to 13.00     |
| Stove Plate (free from burnt).....                     | 10.50 to 11.00     |
| Burnt Iron and Grate Bars.....                         | 8.50 to 9.50       |
| Sheet Iron and Hoops.....                              | 9.00 to 10.00      |
| Plow Steel.....                                        | 13.00 to 13.50     |
| Breaking Stock.....                                    | 12.00 to 12.50     |
| Old Rollers—whole (Iron).....                          | 9.50 to 10.00      |
| Old Rollers (Iron) cut in single Sheets and Rings..... | 13.00 to 14.00     |
| Old Gas Pipe and Boiler Tubes.....                     | 13.00 to 13.50     |
| Cast Borings.....                                      | 9.00 to 9.50       |
| Turnings.....                                          | 12.50 to 13.00     |
| Horseshoes.....                                        | 15.00 to 15.50     |

Old Metals.—Further weakness has been developed in Copper and Brass, and prices have further declined from 1/8 to 1/2c. Zinc, however, has continued strong and other metals have been firm with moderate receipts. The following are the prices paid by dealers in this market:

|                            | Per lb.  |
|----------------------------|----------|
| Copper Wire and Heavy..... | 10 1/2c. |
| Copper Bottoms.....        | 9 1/4c.  |
| Copper Clips.....          | 10 c.    |
| Red Brass.....             | 10 1/4c. |
| Yellow Brass.....          | 8 c.     |
| Red Brass Borings.....     | 9 1/4c.  |
| Yellow Brass Borings.....  | 7 c.     |
| Light Brass.....           | 6 3/4c.  |
| Pipe Lead.....             | 3.70c.   |
| Tea Lead.....              | 3.35c.   |
| Zinc.....                  | 3.45c.   |
| Tin Foil.....              | 21 c.    |
| Pewter, No. 1.....         | 18 c.    |
| Pewter, No. 2.....         | 11 c.    |
| Aluminum.....              | 20 c.    |

Old Rubber.—An easy tone has prevailed under liberal offerings and no improvement in the outlet. Prices, however, are without essential change. Dealers buy at the following prices, Chicago delivery:

|                            | Per net ton. | Per lb. |
|----------------------------|--------------|---------|
| Garden Hose.....           | \$25.00      | .....   |
| Air Brake Hose.....        | 45.00        | .....   |
| Rubber Shoes.....          | .....        | 7 c.    |
| Rubber Car Springs.....    | .....        | 5 c.    |
| Inside Bicycle Tubing..... | .....        | 22 c.   |
| Outside Tubing.....        | .....        | 5 c.    |
| Black Rubber.....          | .....        | 4 c.    |
| White Rubber.....          | .....        | 8 1/2c. |

Rags.—Receipts have increased but little, if any, and dealers have been freer buyers at 75c. to 85c. per 100 lbs. for Country Mixed Rags, Chicago delivery.

Anthracite Coal.—The situation is more serious than at any time since the inauguration of the strike at the mines. Very little Coal is arriving, and dealers are offering \$7 a ton in carload lots. Local stocks are almost depleted, especially Grate and Egg sizes. No relief is expected by operators until late in the fall or early winter. Possibly, it is thought, operations may be resumed in November. In the meantime even higher prices are predicted. As no reliable quotations can be given we omit the usual table.

THE FANNER MFG. COMPANY, Cleveland, Ohio, are calling attention to their Arctic Fruit and Vegetable Presses, which are making quite a success. These Presses are furnished, packed, 1/2 gross in a case.

## THE HARDWARE TRADE.

A generally satisfactory state of affairs is reported throughout the country, and it is believed that the volume of business is running in excess of that of last year. This is most gratifying, as 1901 was a record breaker. In the West an increased demand is noted, which is regarded as indicating an early appearance of the expected heavy fall trade. In the East the quietness of midsummer is occasionally broken by spurts of activity, notwithstanding this is the vacation season and much increase in business is not anticipated before the middle of September. The outlook continues encouraging. The urgent demand for more rapid shipments of general hardware is still reported by manufacturers. As agriculturists have been favored with good crops, which they can dispose of at remunerative prices, and as mechanics and laborers are well employed at good wages, it would seem that the essential elements for a continuance of prosperous times have been bountifully supplied. The market is well maintained on nearly all classes of goods, few changes being noted in prices.

## NOTES ON PRICES.

**Plumbers' Supplies.**—The demand for Plumbers' and Steam Fitters' Supplies is reported as well up to the average volume for the season. Prices are well maintained throughout the whole line and in some directions, particularly in Iron Goods, an advancing tendency has been developed. The outlook is regarded as favorable for a very active fall and winter trade.

**Winter Goods.**—Manufacturers and dealers in all parts of the country report an unusual active demand for the various lines of fall and winter goods. Coal Hods, Stove Boards, Stove Pipe, &c., are all moving in large volume and, in some cases, buyers already find difficulty in securing prompt shipments. Prices on all these lines are well maintained.

**Wire.**—The demand for Plain Wire has improved recently and prices are very firm at \$2.20 from store. The closing down of a number of the mills has resulted in a considerable restriction of production, which has stiffened the market.

**Leather Belting.**—The demand for Leather Belting is good, but as the result of competition prices are somewhat lower than they were last fall, while Belting butts are high, with an advancing tendency. Members of the Leather Belting Manufacturers' Association adhere strictly to the Belting list adopted by the association November 13, 1901, but each member is at liberty to fix the discounts at which to sell his product. A uniform discount is not feasible as no two manufacturers make exactly the same grade of Belts. There is, however, a similarity in such discounts, as is shown below. These fairly represent the market, but may not remain in force any length of time should Hides continue to advance.

### Leather Belting.

|                                            |                          |
|--------------------------------------------|--------------------------|
| Extra heavy, short lap.....                | 60 to 60 and 5 %         |
| Regular, short lap.....                    | 60 and 10 to 60 and 10 % |
| Standard .....                             | 70 to 70 and 5 %         |
| Light standard.....                        | 70 and 10 %              |
| Cut Leather Lacing.....                    | 60 and 10 %              |
| Leather Lacing sides, per square foot..... | 18c.                     |

**Wire Nails.**—The movement of Wire Nails is about in the usual proportion for the season. Buyers, as a rule, require prompt delivery of their purchases, indicating that they are carrying light stocks. Sales are being made in New York of small lots from store at \$2.25 and \$2.30 per keg. Prices are well maintained.

**Cut Nails.**—A fair demand is reported for Cut Nails. In some sections where Iron Cut Nails are in demand buyers are willing to pay a premium for them, owing to the scarcity. Small lots from store, New York, are quoted at \$2.30 per keg.

**White Lead.**—While the use of White Lead in Oil is limited at this time of the year, there is a fair demand. The coming season is looked forward to with anticipation of good business in this field. Prices are unchanged, small lots from store, New York, being quoted at 6¼c. to 6½c. per lb.

**Linseed Oil.**—The demand for Linseed Oil has been confined to small lots. On August 19 prices were re-

duced 7c. per gallon on Oil, the price of new Flaxseed having dropped sharply. A further reduction in price is not unexpected, but may not materialize until the first part of September. City Raw in small lots is quoted at 61c. to 61½c. per gallon, Boiled Oil being 2c. per gallon advance on Raw.

**Spirits Turpentine.**—The price of Turpentine has dropped off ½c. during the week. This reduction brought large consumers and canners into the market early this week, and reduced the local supply considerably. The demand is now moderate, the retail prices being 47c. to 47½c. per gallon.

## TRADE NOTES.

**THE SEAVEY MFG. COMPANY**, 120-122 North street, Boston, Mass., manufacturers of Metal Ware, announce to the trade that they have concluded to discontinue their Boston store at the above address, but will continue the business at their factory in Cambridge, Mass. The announcement states that they have on hand a large and varied assortment of goods which they will offer at prices to attract buyers on quick sales for cash.

**FRANK WRIGHT** of Cavespring, Ga., has erected a building, and is installing machinery for the manufacture of a patented Woven Wire Fly Escape Screen of his invention.

**THE SPRAY WASHING MACHINE & MFG. COMPANY** of Baltimore, Md., have been incorporated with a capital stock of \$50,000, to deal in Washing Machines, Household Articles and Novelties. The incorporators are Henry S. Sohl, Walter H. Waddell, William W. Radcliffe, Gideon P. Hopkins and Henry S. Abenschein.

**SILVER & Co.** of Brooklyn, N. Y., manufacturers of Household Novelties, recently suffered a loss of a considerable amount of stock as a result of a fire in their New York City agency, at 18 Warren street.

**THE JOSEPH DIXON CRUCIBLE COMPANY**, Jersey City, N. J., are sending to the trade pictures of an 18-story steel frame structure ready for the wall casing, calling attention to the fact that Dixon Silica Graphite Paint was selected to protect this work from corrosion. A pamphlet explaining the economy of protective painting will be supplied by the concern to those who desire a copy.

**THE AMERICAN BLOWER COMPANY** of Detroit, Mich., and 141 Broadway, New York, are sending out their sectional catalogue, 141, devoted to the A. B. C. Pressure and Volume Blowers. These Blowers are made in a variety of sizes and styles with steel and cast iron housings. Blast Gates, Countershafts, Pulleys and the various devices required for their insulation are also shown. The last pages of the catalogue are devoted to tables of useful information to those who install fan and blower systems for exhaust or pressure work.

**THE LAURENTIAN ASBESTOS & MICA COMPANY** have been incorporated under the laws of New Jersey, with a capital stock of \$300,000, to manufacture Asbestos and Mica. The incorporators are John L. White, Francis McFarlen and Charles Hardenberg, all of Jersey City, N. J.

**THE PORTLAND ANTIMONY COMPANY** of Portland, Me., have been incorporated with a capital of \$200,000. The officers are C. H. Barker, president, and G. H. Blake, treasurer, both of Portland.

**THE CONSUMERS CAN COMPANY**, Baltimore, Md., are sending through the mails a large size folder printed on manila paper, containing cuts and descriptions of some of their specialties in Tinware and Tinnery's Trimmings. These include Covered Buckets, Pieced Tin Cups, Wax Top Cans, Surprise Egg Whips, Flour Sifters, Ever-Ready Knobs, Kettle Covers, Lamp Brackets, Scoops and a variety of materials for can makers use.

**THE GRASSELLI CHEMICAL COMPANY**, Cleveland, Ohio, have adopted the plan of sending out large size postal cards of striking designs and coloring, calling the attention of the trade to their Eureka Soldering Flux. The patterns are oriental in character and cannot fail to excite the interest of the recipient, who will inevitably read the letter press placed beneath the cut and become impressed with the fact that the Eureka Soldering Flux is worthy of his attention.

THE NATIONAL-FULTON BRASS MFG. COMPANY, Detroit, Mich., recently incorporated with a capital stock of \$400,000, are a reorganization of the Fulton Iron & Engine Works, manufacturers of Monarch Bronze in Ingots, Bronze and Brass Castings, Journal Bearings, Babbitt Metals, &c. The new company, besides largely increasing the capacity of the present plant, will erect new works at St. Louis, plans for which are under way. The officers are George H. Russell, president; M. T. Conklin, first vice-president; J. F. Harrigan, second vice-president; and F. E. Beal, secretary.

THE MANHATTAN BRASS COMPANY, New York, have issued their Catalogue No. 21, illustrating Lamp Burners, Lamps, Candlesticks and Candelabra, Chafing Dishes, Incandescent Gas Burners, Gasoline Fixtures, Cuspidors, Bicycle Lamps, &c.

JOHN MAXWELL'S SONS, 259 Pearl street, New York, are distributing an illustrated catalogue of their patented Bird Cages. The guards of these Cages are made of fine brass wire, by raising which the perches can be taken out and the bathtubs set in the cage.

THE GEORGE WORTHINGTON COMPANY of Cleveland, Ohio, have issued a catalogue showing their Electric Goods, including Telegraph and Telephone Supplies, Lamps, Fixture Supplies, Motors, Electric Fans, &c.

THE SOUTHWESTERN SLATE MFG. COMPANY of Slatington, Ark., have filed articles of incorporation increasing their capital stock to \$10,000,000. The company are developing Slate quarries at Slatington and will build a railroad from there to Hot Springs, Ark., 56 miles distant.

J. A. HARPS of Ackermanville, Pa., who purchased the patent rights, stock, tools, &c., of the Never-Fail Oil & Gasoline Can Company at Greenfield, Ohio, a few months ago, reports that since beginning operations the output has been trebled, and he is now not able to keep up with the increasing demand for the Cans which are being shipped to all parts of the country. An inquiry for a large number of the Cans has also been received from London, England. Mr. Harps has associated with himself in the manufacture of these Cans, Eugene Arnott and his brother, J. S. Arnott, the former being the inventor of the Can, and has formed the J. A. Harps Mfg. Company of Greenfield.

This is the season when the prudent dealer will lay in his stock of Coal Hods. It is already reported that the run on these goods is so heavy that in some cases manufacturers have been unable to meet the pressing requirements of their customers. In this connection it will be well to take notice of the announcement of Sidney Shepard & Co., Buffalo, N. Y., to the effect that they are able to meet all orders for Coal Hods promptly.

### A Pipe Rack for Displaying Kitchen Utensils.

In the accompanying illustration is shown a rack made of 1-inch water pipe that is placed on the back of a counter in the store of Stark Bros., Stamford, Conn.

A Pipe Rack for Displaying Kitchen Utensils.

From this are hung small kitchen and household utensils by means of copper wire bent with a hook at each end. This rack serves as a convenient way of bringing to the attention of customers a line of small articles that are frequently lost sight of in the store.

QUISH & PRATT are successors to Quish & Olsaver in the Stove, Tinware, Hardware, Farming Implement and Sporting Goods business in Dexter, Mich.

## Stove and Hardware Dealers.

REED & EDGERTON have purchased the Stove, Hardware, Farming Implement and furniture business of W. C. Sutton at St. Edwards, Neb.

HANSEN BROS. and J. C. Petheram have consolidated their stores in Kanawha, Iowa, under the style of the Petheram, Hansen Company. The stock carried embraces Stoves, Tinware, Shelf and Heavy Hardware and Sporting Goods.

J. P. STAGG is successor to Stagg & Conrad in the Stove, Hardware and Sporting Goods business in Anaconda, Mont.

STRINGFELLOW & TANNEHILL, dealers in Stoves, Shelf and Heavy Hardware, Agricultural Implements, Sporting Goods, &c., Roswell, N. M., were burned out in the large fire in that place several weeks since. Their loss above insurance was about \$2000. The firm promptly bought a new stock to replace that destroyed and are again in a position to fill the orders of their customers.

GELSER & GILCHRIST, in the Stove, Hardware and Farm Implement business in Vinton, Iowa, have been succeeded by Gilchrist & Smeltzer.

WILMOT CASTLE & Co., Rochester, N. Y., are calling attention to the special inducements for stove dealers to handle their New Era Stove Pipe Radiator. This device can be presented with special effect now that the effect of the coal strike is brought home to every one.

**THE CHANCE OF A LIFETIME.**

A first-class Plumbing and Heating Business for sale in an up-to-date Southern city of twelve thousand inhabitants.

The city has water and sewer mains on almost every street, also gas mains.

Plenty of building going on and plenty of work on hand.

This is a chance for some one to step into a safe and paying business, without any extra expense.

There is only one other shop in town, and they are members of the Master Plumbers' Association.

The proprietor has other business out of town, and is obliged to give up one or the other.

Inventory of stock about three thousand or a little over.

Climate unsurpassed.

Address

**SOUTH,**

Care The Metal Worker, New York.

**Partner Wanted.**

To join me in either buying the entire plant or controlling interest of the Lexington Stove Works, Incorporated. The present stockholders are all engaged in other business. Established business. Carload customers. Jobbing and odd plate work. Pays handsome profits. ## ROOFING, CORNICE & SKYLIGHT MANUAL

describes and illustrates accurately the laying of flat and standing seam roofing, country cornice shop practice, including shop equipment and cornice making, and the design and construction of skylights. The following are some of the subjects treated upon:

### TIN ROOFING

An article prepared specially for this book.

#### Equipment and Methods

THE ROOFING BENCH.  
PUTTING THE TIN TOGETHER.  
SOLDERING.  
FLAT SEAM ROOFING IN STRIPS.

#### Flat Seam Roofing

NOTCHING AND EDGING.  
HAND TOOLS, FIRE POT'S AND SUPPLIES.  
THE USE OF CLEATS.  
ROSINING SEAMS, SOLDERING AND COPPERS.  
VALLEYS AND GUTTERS.  
CONNECTING ROOF TO WALL FLASHING.  
FINISHING AROUND SKYLIGHTS AND SCUTTLES.  
COVERING THE SIDES AND TOPS OF BULKHEAD.  
FLASHING PARAPET WALL.  
SOLDERING UPRIGHT SEAMS.

#### Standing Seam Roofing

EDGING THE STRIPS.  
CLEATS FOR HOLDING THE STRIPS.  
FINISHING STANDING SEAMS AT GUTTER.  
CONNECTING FLASHING WITH ROOF.  
MAKING A MITERED STANDING RIDGE SEAM.  
STEP FLASHING.

#### Flashings for Slate or Shingle Roofs

WALL FLASHING.  
SHINGLE FLASHING.  
PUTTING IN A VALLEY.  
FLASHING AROUND A CHIMNEY.

#### Table of Quantity of Tin for Roofs

### "THE COUNTRY CORNICE SHOP."

Reproduced from *The Metal Worker*.

FITTING UP SHOP.  
RIDGE AND GUTTER FORMER AND BENCH TOOLS.  
DRAWING INSTRUMENTS.  
LEADER ELBOWS.  
SQUARE RETURN EAVE TROUGH MITER.  
GUTTER SPOUTS.  
MAKING EAVE TROUGHS.  
OPERATING THE CORNICE BRAKE.  
PATTERN OF MOLDED EAVE TROUGH.  
EAVE OR SNOW GUARD GUTTERS.  
CONNECTING GUTTER TO LEADER.  
OBTAINING THE DIFFERENT LENGTHS OF BRACES.  
SHORT RULES.  
MOLDED GUTTERS ON BRICK WALLS.  
FULL SIZE PATTERNS.  
PUTTING UP THE GUTTER.  
TAKING MEASUREMENTS AND MAKING PATTERNS.  
LEADER PIPES AND FASTENINGS.  
BENDING SQUARE LEADER.  
A HOME-MADE HATCHET STAKE.  
LEADER HOOKS AND COVERINGS.  
CONCEALED HANGERS.  
PATTERNS FOR COVERINGS.  
PATTERNS FOR BRANCHES AND JOINTS.  
PATTERNS FOR T-JOINTS.  
FLARING COLLARS FOR ROUND, SQUARE AND OCTAGON PIPES.

### SKYLIGHT CONSTRUCTION.

Consisting of two Competition Prize Essays reproduced from *The Metal Worker*.

#### First-Prize Essay

GROUND PLAN AND ELEVATION OF SKYLIGHT.  
SECTIONAL VIEWS, FULL SIZE, OF THE CURB AND BARS USED.  
PLAN OF TOP MITERS.  
DEVELOPMENT OF CURB AND RIDGE MITERS.  
PATTERN OF SIDE BAR C.  
DEVELOPMENT OF HIP BAR AND MITERS.  
PATTERN OF HIP BAR.  
TOP MITERS FOR D AND F BARS.  
TOP MITER FOR THE E BAR.  
DEVELOPMENT OF CAP MITERS.

#### Second-Prize Essay

MAKING A SKYLIGHT.  
FINDING LENGTH OF BARS.  
LAYING OUT PATTERN FOR CURB.  
PATTERN FOR COMMON BAR.  
PATTERN FOR VENTILATOR.  
PROFILE OF HIP BAR.  
PATTERN FOR HIP BAR.  
PATTERN FOR JACK BARS.

175 Pages, 170 Illustrations, 13 Plates.

Price \$1.50, postpaid.

### The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

**M F**  
**Roofing Tin**

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This **MF** mark stamped on every sheet. Ask your roofer, or

# Shears and Punches for Range Makers.

Drop Throat Shears.

On account of the deep throat these machines can be used for cutting and punching holes in large sheets. The knives *are arranged to swivel*, which permits of cutting from front to back, right to left, or at any desired angle, according to the nature of the work. The position of the knives can be changed quickly. The knives are 4 in. long, and each of them has two cutting edges, which can be used alternately.

For punching work, a die holder with die, punch and stripper takes the place of the knives.

Will cut iron up to  $\frac{1}{8}$  in. thick.

Will punch  $\frac{1}{4}$  inch hole in No. 14 iron.

MADE BY

Niagara Machine & Tool Works, Buffalo, N. Y.

## THE PECK, STOW & WILCOX CO.

Highest Grade.

HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, **IT IS THE BEST IN THE WORLD.**

96 inches long.

Our Improved Eureka  
Cornice Brake. Will bend  
No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.  
With Lever Arc, Automatic Gauge. Will cut No. 2 iron  
97 inches long.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel  $\frac{1}{8}$  inch thick, cut off and mitre angle iron  $\frac{1}{8}$  inch thick, and do it perfectly.

NOT long ago a Philadelphia dealer installed a Paragon Furnace and the "next best" furnace in two houses under exactly the same conditions of installation and management. Then he pasted strips of paper over all the registers and found that the volume of heated air from the other furnace blew the strips of paper out to an angle of about 45 degrees, while the greater volume of heated air from the Paragon forced the paper to about 90 degrees.

He wanted to find out whether we were exaggerating when we said the Paragon would give more heat than any other furnace made. He voluntarily told us we told the truth.

"Art is the expression of man's joy in his work."—ELBERT HUBBARD

WE MAKE  
The Columbian and Peerless Grates  
FOR COAL AND WOOD  
and Gas Log Fires,  
"THE BISELL LINE"

THEY ARE MADE IN DESIGNS TO SUIT EVERY TASTE—TO PLEASE EVERY FANCY  
—TO MEET EVERY REQUIREMENT.

Portraying that which is beautiful in nature, appealing to that which is noble in man. In them the works of the artist and of the artisan blend so beautifully that neither may be praised without complimenting the other.

PERHAPS CAST IRON HAS NEVER FURNISHED SUCH ELEGANT AND DESIRABLE ENRICHMENTS FOR THE HABITATION OF MAN.

Special designs for the home—the club or the public building—finished in all the varied colorings of the rich and baser metals.

In construction they are scientifically accurate—that their setting is simple—the perfect operation sure, and

THEIR DURABILITY IS A MATTER OF HISTORY.

MADE ONLY BY

## A Business ...Fact...

Many articles of merchandise are sought after by consumers and profitably sold because they have what is known as REPUTATION. Similar articles, to be had for less money, do not sell easily, and the efforts of the merchants to dispose of them as "substitutes" are not only unprofitable but entail actual loss.

First Prize, Paris, 1900.

The only safe way is to get control of goods that are

### Acknowledged the Standard

keep a good stock well displayed, arranging in the most presentable manner, become familiar with and explain the merits of the goods and their special features.

Thousands of dealers have been doing this with "GARLANDS." and have met with great success. If you are not of the number, it would pay you to test the selling popularity of "GARLANDS."

# Monarch Ventilator No. 164

## A CALORIFIC WONDER

Improved for 1902 by the substitution of *cast iron* fire-box section in place of sheet steel, the intense heat generated making this necessary.

Two 15-inch burners, with four rows of gas orifices in each, produce a terrific fire which quickly sets the incandescent brick clinkers to glowing, and the MONARCH Ventilating and Radiating System of pipes combine to make this the equal of a *hard coal base burner*.

DIMENSIONS:—Height, 33 inches. Width, 20 inches. Depth, 13 inches.

## Artistic Enameled Steel Ranges. . .

The only Enameled Ranges on the market to-day. Are not to be confused with the Black Japan and so-called baked enameled ranges which will burn off and rust. Our Enamel being fused with the iron is guaranteed rust and fire proof.

The Highest Grade of materials only are used in the construction of our ranges and our Enameling Process is the only successful one.

An ornament to the kitchen and a delight to the housekeeper because so easily kept BRIGHT and CLEAN by use of soap and water, doing away with the objectionable stove polish.

An attractive line and ready sellers. Send now for Illustrated Catalogue.

THE ST. LOUIS ENAMELING COMPANY,

S. E. Cor. Ninth and Monroe Streets, ST. LOUIS, MISSOURI.

We do enameling of Specialties and our line of Enameled Steel Signs cannot be excelled.

The miners' strike continues. Its black blight is felt everywhere. Misery, bloodshed and disaster are in its track; and the future is dark. It should end, even if both sides must fail. The cost of fuel will be damaging to every business and will cause untold distress to the poor. It were better for men that millstones were hanged about their necks and they cast into the sea than for them to be guilty of further prolonging this iniquitous strike.

We manufacture a complete line of heating and cooking stoves constructed especially for bituminous coal—also wood burners. Fuel savers, perfect in operation. Our trade name, "Sunshine," is famous everywhere and stands for the best among stoves.

Our catalogue is worth having.

This is the second season for the

### Mystic Sunshine Range,

and its popularity is still increasing. Made in all sizes. For bituminous coal, anthracite coal, or wood. A specialty. Selling faster than any range ever made. Send for circular.

### IF YOU ARE NOT SELLING THE Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,  
CINCINNATI, OHIO.

# The New WALKER BOILER for Steam: for Water

Our boilers for either Steam or Water Heating will extract more heat from a shovelful of coal and keep the radiation warmer and at a more even temperature than any other boiler. Why? Because every part of its highly effective heating surface in the fire box, or over the fire, is exposed to direct heat. Boilers are fitted with all best and latest improvements, easy to clean flues and to operate. We want you to become acquainted with our productions. It will pay you. Burn any kind of fuel.

**M. H. SULLIVAN & SON,**  
High-Glass Painting and Decorating.

FALL RIVER, MASS., January 10, 1902.

DIGHTON FURNACE CO.,  
Taunton, Mass.

*Dear Sirs:* The Dighton Furnace with Hot Water Combination attachment, which was installed in my residence a couple of years ago, is very satisfactory in every way.

It requires very little care and uses less fuel than any furnace I have ever had any experience with.

Several of my friends now use the "DIGHTON," having bought through my recommendation, and they speak as highly of it as I do, and recommend it, especially for its economy of fuel.

Yours truly,

M. H. SULLIVAN.

# GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

## The YANKEE Hot Air DAMPER (IMPROVED.)

HOT AIR.

THE YANKEE EXCELS.

SMOKE PIPE.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market.

It is impossible for this rod when in position to move either way.

ROD POINTS: Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of 1/4 in. cold-rolled steel and slips into damper very smoothly. Sample sent to any Dealer without charge.

The S. M. HOWES CO., Manufacturers, 40-46 Union St., Boston, Mass.

## The Climax RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads 1/4 to 1 in. pipe, takes 2 or 2 1/2 in. die, \$10.00.

No. 2 threads 1 to 2 in. pipe, takes 2 1/2, 3 and 4 in. die, \$17.00.

For sale by leading jobbers.

Manufactured Solely by  
C. M. Kemp Mfg. Co.,  
Baltimore.

# Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ Inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. Hot water circulation and hot water supply in buildings are treated at considerable length.

## PART OF CONTENTS:

### DANGEROUS BLUNDERS IN PLUMBING.

Running Vent-Pipe in Improper Places — Connecting Soil-Pipes with Chimney-Flues—By-Passes in Trap-Ventilation, etc.  
▲ Case of Reckless Botching.  
▲ Stupid Multiplication of Traps.  
▲ Trap Made Useless by Improper Adjustment of Inlet and Outlet Pipes.  
Unreliability of Heated Flue as a Substitute for Proper Trapping.  
Need of Plans in Doing Plumbing-Work.

### HOUSE-DRAINAGE.

City and Country House-Drainage—Removal of Ground-Water from Houses — Trap-Ventilation — Fresh-Air Inlets—Drain-Ventilation by Heated Flues—Laying of Stoneware Drains.  
Requirements for the Drainage of Every House.  
Ground-Water Drainage of a Country House.  
Ground-Water Drainage of a City House.  
Fresh-Air Inlets.  
The Location of Fresh-Air Inlets in Cities.  
Air-Inlets on Drains.  
The Proper Way to Lay Stoneware Drains.  
The Tightness of Tile-Drains.  
Danger of Soil-Pipe Terminals Freezing unless Ends are without Hoods or Cows.  
Objection to Connecting Bath-Waste with Water-Closet Trap.

How to Adjust the Inlets and Outlets of Traps.  
How to Protect Trap when Soil-Pipe is used as a Leader.  
Size of Ventilating-Pipes for Traps.  
How to Prevent Condensation Filling Vent-Pipes.  
How to Prevent Accidental Discharge into Trap Vent-Pipe.  
Why Traps should be Vented.

### MISCELLANEOUS.

Syphoning Water through a Bath-Supply.  
Emptying a Trap by Capillary Attraction.  
As to Safety of Stop-Cocks on Hot Water Pipes.  
How to Burnish Wiped Joints.  
Admission to the New York Trade Schools.  
Irregular Water Supply.  
Hot Water from the Cold Faucet, and how to Prevent it.  
Disposal of Bath and Basin Waste Water.  
To Prevent Corrosion of Tank Lining.  
Number of Water Closets Required in a Factory.  
Size of Basin Wastes and Outlets.  
Tar Coated Water Pipe Affect Taste of Water.  
How to Heat a Bathing-Pool.  
Objections to Galvanized Sheet Iron Soil-Pipe.  
To Prevent Rust in a Suction Pipe.  
Automatic Shut-Off for Gas Pumping Engines, when Tank is Full.  
Paint to Protect Tank Linings.

Size of Water-Pipes in a House.  
How to Make Rust Joints.  
Covering for Water-Pipes.  
Size of Soil-Pipe for an ordinary City House.  
Where to Place Burners to Ventilate Flues by Gas Jets.  
How to Prevent Water Hammer.  
Why a Hydraulic Ram does not Work.  
Proper Size of Water-Closet Outlets.  
Is a Cement Floor Impervious to Air?  
Two Traps to a Water Closet Objectionable.  
Connecting Bath-Wastes to Water-Closet Traps.  
Objections to Leaching Cesspool and Need of Fresh Air Inlet.  
The Theory of the Action of Field's Syphon.  
How to Disinfect a Cesspool.  
Slabs for Pantry Sinks—Wood vs. Marble.  
Test for Well Pollution.  
Corrosion of Lead Lining.  
Size of Flush Tank to Deal with Sewage of a Small Hospital.  
Details of the Construction of a House-Tank.  
The Construction of a Cistern under a House.  
To Protect Lead Lining of a Tank, and Cause of Sweating.  
Stains on Marble.  
Lightning Strikes Soil-Pipes.  
How to Fit Sheet Lead in a Large Tank.  
Why Water is "Milky" When First Drawn.  
Carving-Tables.

Is Galvanized Pipe Dangerous for Soft Spring Water?  
How to Arrange Hush Pipes in Cisterns to Prevent Syphoning Water Through Ball Cock.  
Depth of Foundations to Prevent Dampness of Site.  
Self-Acting Water Closets.  
Wind Disturbing Seal of Trap.  
How to Draw Water from a Deep Well.  
Cause of Smell of Well Water.  
Absorption of Light by Gas Globes.  
Fitting Basins to Marble Slabs.  
Intermediate Tanks for the Water Supply of High Buildings.  
How to Construct a Filtering Cistern.  
Objections to Running Ventilating Pipe into Chimney-Flue.  
Size of Water Supply Pipe for Dwelling House.  
Faulty Plan of a Cesspool.  
Disposing of Refrigerator Wastes.  
Pumping Air from Water Closet into Tea Kettle as Result of Direct Supply to Water Closets.  
Danger in Connecting Tank Overflows with Soil-Pipes.  
Arrangement of Safe Wastes.  
What is Reasonable Plumbers' Profit?

### HOT WATER CIRCULATION IN BUILDINGS.

### HOT WATER SUPPLY IN VARIOUS BUILDINGS.

# Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 Inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

### BOILERS.

On blowing off and filling boilers.  
Where a test-gauge should be applied to a boiler.  
Domes on boilers; whether they are necessary or not.  
Expansion of water in boilers.  
Cast vs. wrought iron for nozzles and magazines of house-heating boilers.  
Pipe-connections to boilers.  
Passing boiler-pipes through walls; how to prevent breakage by settlement.  
Heating-boilers. (A problem.)  
Isolating-valve for steam-main of boilers.  
On the effect of oil in boilers.  
Proportions for rivets for boiler-plates.  
Iron rivets and steel boiler-plates.  
Is there any danger in using water continuously in boilers?  
A supposed case of charring wood by steam-pipes.  
Domestic boilers warmed by steam.

### VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.  
Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.  
Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.  
Calculating the amount of radiating-surface for a given room.  
How much heating-surface will a steam-pipe of given size supply?  
Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.  
Computing the cost of steam for warming.

### RADIATORS AND HEATERS.

Improper position of radiator-valves.  
Hot-water radiator for private houses.  
Remedying air-binding of box-coils.  
How to use a stove as a hot water heater.  
"Plane" vs. "Plain" as a term as applied to outside surface of radiators.  
Relative value of pipe on cast-iron heating surface.  
Relative value of pipe on steam-coils.  
Warming churches (plan of placing a coil in each pew).  
Warming churches.

### PIPE AND FITTING.

Steam-heating work—good and indifferent.  
Piping adjacent buildings: pumps vs. steam-traps.  
True diameters and weights of standard pipes.  
Expansion of pipes of various metals.  
Expansion of steam-pipes.  
Advantages claimed for overhead piping.  
Position of valves on steam-riser connection.  
Cause of noise in steam-pipes.  
One-pipe system of steam-heating.  
Air-binding in return steam-pipes.

How to heat several adjacent buildings with a single apparatus.  
Air-binding in return steam-pipes, and methods to overcome it.

### VENTILATION.

Size of registers to heat certain rooms.  
Determining the size of hot-air flues.  
Window ventilation.  
Removing vapor from dye-house.  
Calculating sizes of flues and registers.  
On methods of removing air from between ceiling and roof of a church.

### STEAM.

Economy of using exhaust steam for heating.  
Heat of steam for different conditions.  
Superheating steam by the use of coils.  
Effect of using a small pipe for exhaust steam-heating.  
Explosion of a steam-table.

### CUTTING NIPPLES AND BENDING PIPES.

### RAISING WATER AUTOMATICALLY.

### MOISTURE ON WALLS, ETC.

### MISCELLANEOUS.

Heating water in large tanks.  
Heating water for large institutions and high city buildings.

Questions relating to water-tanks.  
On heating several buildings from one source.  
Coal-tar coating for water-pipe.  
Filters for feeding house boilers.  
Other means of clarifying water.  
Testing gas-pipes for leaks, and making pipe-joints.  
Differential rams for testing fittings and valves.  
Percentage of ashes in coal.  
Automatic pump-governor.  
Cast-iron safe for steam-radiators.  
Preventing fall of spray from steam-exhaust pipes.  
Heating and ventilation of a prison.  
Amount of heat due to condensation of water.  
Expansion-joints.  
Resetting of house-heating boilers—a possible saving of fuel.  
How to find the water-line of boilers and position of try-cocks.

### MISCELLANEOUS QUESTIONS.

Applying traps to gravity steam-apparatus.  
Connecting steam and return risers at their tops.  
Power used in running hydraulic elevators.  
On melting snow in the streets by steam.  
Arrangement of steam-coils for heating oil-stills.  
Converting a steam-apparatus into a hot-water apparatus and back again.  
Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

Fire Pot

## A Good Fire Pot

should be in the hands of every up-to-date mechanic, and, while the first cost is more, you will surely save its cost.

1st. In the saving of gasoline (you buy it all the while), as less is needed.

2nd. In the saving of time (for which you are paying), as more and better work can be done.

3rd. The No. 5 possesses many advantages, making it valuable to you. Our catalog is free. Remember, our name on a Fire Pot means your money back if you are not pleased.

Jobbers sell at factory price.

## The Losses Through the Anthracite Coal Strike.

From week to week there are published estimates of the cost of the anthracite strike which make a brave showing and look decidedly complete and fair. The loss of wages to the men is figured out, which we suppose may be done pretty closely. We are told how many millions of dollars the coal companies and the railroads lose in profits, which may or may not be wide of the mark. Quite a display of millions is made over the loss of business of local merchants and other incidental matters. Now all these statistics are based on the assumption that every ton of anthracite coal not mined during the strike represents just so much total loss, and this, in the face of the fact, only too well known, that the one serious feature of the anthracite coal mining industry is that the men are employed less than 200 days in the year, and that the capacity for production of the collieries is greatly in excess of the demand. In other words, the strike is causing idleness which would have occurred in any case, and when the mines do start up they can and probably will produce a good deal of the coal on which our statisticians figure such great losses. The anthracite coal industry has had serious losses during the struggle. Every ton of bituminous coal burned by consumers who ordinarily use anthracite is business lost, with the chance that some customers may have been taken away forever. But the great mass of the requirements is simply in suspense, and this is particularly true of the domestic demand, which will not be seriously felt for some time to come. Instead of entering the winter with enormous stocks, as usual, the anthracite trade will have many months of work at maximum pressure, and will have then to fill the yards and storage plants so utterly depleted. The sacrifices which the manufacturing industries, and notably the Eastern iron trade, have been forced to make are serious enough and the anthracite mining industry must suffer keenly, but it is ridiculous to parade the huge figures which the amateur statisticians are putting forward. They absurdly exaggerate the situation and contribute to the feeling, only too prevalent, that a great industry and all those connected with it have been seriously crippled.

## Popularity of Metal Ceilings.

The use of sheet metal for covering ceilings and side walls is rapidly growing throughout the United States. The advantages of stamped metal for interior decoration are so many and the attractive and artistic effects produced by the creations of modern steel ceiling makers

are so striking that the popularity of this material is growing by leaps and bounds. At first metal ceilings and side walls were almost exclusively used in offices, hotels, stores, public halls or business buildings. Of late, however, architects have come to favor the use of sheet metal for interior decoration in private houses, while many modern churches are also making use of this material. The number of manufacturers who turn out this product has increased materially within the last decade, and most of them have been forced to extend their facilities from year to year in order to keep pace with the growing demand for their goods. It is to the credit of the manufacturers in this line that they are educating the public taste by the exceptionally handsome and artistic designs in which they are offering their products. Some of the manufacturers engage the exclusive service of artists to make their designs, much in the same way as do the makers of wall paper, dress goods and upholstery materials. A glance through the recent catalogues of the metal ceiling manufacturers will show what an immense advance in the direction of art has been made by them of late. So important has become this industry that a distinct class of workmen has sprung up under the name of metal ceiling hangers, who are experts in the erection of metal ceilings and side walls, and who are paid a high rate of wages. Most of the metal ceiling manufacturers maintain their own staff of erectors and are accustomed to contract not only to supply the material, but to put it in place in the best possible manner. When in place the metal ceiling further requires the services of the painter and decorator to finish it. This work calls for no small amount of skill and taste in order to bring out the best effects obtainable from the stamped metal designs, and to produce the proper harmony in the color scheme to correspond with the furnishings of the room or hall. A special class of workmen, called metal ceiling painters, are therefore employed by the manufacturers in conjunction with the metal ceiling hangers. Already the foreign markets are beginning to show an interest in American metal ceilings and stamped ware for interior decoration, and an increasing amount of these goods is being exported. In some cases expert American workmen have even been sent abroad to erect the metal ceilings or to teach the foreign workmen how to put them in place in a proper manner. There is no doubt that, in the course of time, American manufacturers will be called upon to supply a large volume of products in this line to foreign buyers. The field would seem to be almost unlimited.

## Sizes of Catalogues.

A persistent demand exists for the standardization of catalogues. This demand comes not only from merchants but from purchasing agents of railroad companies and other large corporations consuming a great variety of goods. They find it exceedingly inconvenient to arrange their catalogues systematically so as to permit ready reference. It is true that a great many catalogues now show some approach to uniformity, as a result of the continued agitation of this question, but there are very many others of motley size. Some are tall and thin. Others are short and very stout. Some are of such small size that they can be conveniently carried in the

pocket. Others are so huge that a dictionary stand is required to handle them conveniently. The variety in size causes great difficulty in the arrangement of a collection of catalogues on shelving or in a bookcase. Some cabinets have been constructed with a special view to holding catalogues, but these are not available for every catalogue that comes to hand. The suggestion is made that manufacturers and jobbers endeavor to conform to what they observe is the most popular size among houses in their particular line. It may not be practicable to have all trade catalogues of precisely the same size. What is advantageous or especially convenient for one line of business may not be strictly appropriate for another line. Nevertheless, taking one particular branch of trade, those engaged in that line can adopt a size suited specially to their requirements. This is an era of standardization, and the principle has been applied to so many things in so many different lines that it is absurd to say that catalogues are an exception. If they were more nearly uniform it is safe to say that many catalogues would be preserved for reference which now speedily find their way to the waste basket, despite their embellishments. It would certainly seem possible to have only three or four sizes instead of the great variety now in use.

### Editorial Notes.

In a recent article in the *Forum* Henry Gannett points out that of all the manufactured goods produced in the world the United States contributes more than one-third, or 34 per cent. Its production of manufactured goods is nearly seven times as great as its proportion of population. Of the other leading industrial nations Great Britain contributes 15 per cent. of the manufactured goods of the world, Germany 12 per cent. and France 11 per cent. These figures suggest the remarkable efficiency of the American artisan, which is borne out by an examination of the figures of production and of competition. Thus it is shown that the average value of manufactured product per hand in the United States is \$1900 per annum, while the French artisan, under the same rule, produces \$650, the English artisan \$485 and the German \$405. In other words, the product per hand of the United States artisan is nearly three times as great as that of his closest competitor.

Metallic construction appears to have had not the least power of resistance during the volcanic eruption at St. Pierre. Not only was it incapable of withstanding the weight of the burning matter, but some chemical action is likely to have taken place which transformed the particles. M. Amadée Knight, a senator of Martinique, was on the island at the time of the disaster, and describes the effects as corresponding with those which might be expected if some colossal Nasmyth's hammer had been employed in operation on the town. Most things have been reduced to a fine powder. One of the cases mentioned is the market of St. Pierre. After the cyclone of 1891 the authorities decided to reconstruct it in the most solid manner. Cast iron was adopted. It is said to have been impossible to find the slightest trace of construction which had an area of 2000 meters square.

W. H. Anderson & Sons, a well-known firm of manufacturers of stone and marble working tools in Detroit, Mich., recently gave a dinner to celebrate the thirtieth anniversary of continued service with them of one of their foremen. Eleven other foremen were also present at the banquet, one of whom had been with the firm for 22 years, two others for 12 years, and another for ten

years. The firm in question evidently recognize the desirability of considerate and kindly treatment of their employees and of a proper recognition of their aid in building up their business. It would foster a better understanding between employers and employees if considerate actions of this kind were more common. One of the first essentials in the successful building up of a manufacturing business is the maintenance of mutually cordial relations between employers and their workmen, and their occasional coming together in a social way would tend more than anything else to stimulate such desirable relations.

### Can Panics Be Prevented?

A highly interesting address was delivered by S. R. Flynn, president of the National Live Stock Bank of Chicago, before the convention of the Minnesota Bankers' Association, in which he discussed the subject "Can Panics be Prevented?" He studies the causes of bank panics and takes the ground that they are not unmixed evils, and says:

I have no intention to ascribe panics to the will of God; yet I may say without hesitation that panics cannot be prevented by human legislation. Legislation cannot remove or even reach the great first cause of all financial and business disasters—overconfidence. All other causes I have given, all other causes that others give, are not causes; they are effects or aggravations. It is the fashion to attribute financial crises and panics to bad banking or bad monetary laws. Bad banking and bad financial laws aggravate crises, intensify panics and prolong periods of depression, but they do not cause panics. I do not intend to go into the causes and history of all the financial troubles of this and other countries. It suffices to say that they invariably follow periods of overconfidence. Whenever there have been great progressive impulses in this country, or in any country, even those countries with banking and currency systems having the high approval of our financiers, there have been sharp reactions. And so it will ever be. In the years of overconfidence prices set a pace too fast for legitimate growth and soon leave development far to the rear. There can be but one result. There comes a time when market prices and actual values must get closer together, and when that time comes the necessary process of readjustment hurts. Then comes the crisis, the panic, the depression—one or the other or all three in the order given. You cannot name a country that has enjoyed any great commercial development that has not had its panics, its crises, its periods of depression. And there never will be such a country, no matter what banking or currency scheme may be in use.

### Trade in the Northwest.

A correspondent sends us the following advices in regard to business in the Northwest, which is evidently of a very satisfactory character:

Business in the Northwest is in an exceedingly prosperous condition—good crops with fair prices—fine cattle and big prices for beef and wool, and even the copper mining is not in as bad a state as many Wall Street folks seem to want the public to believe. There is much new building being done in Minnesota and the Dakotas, and no small amount in the towns of Montana. All this is, of course, making good trade, and in my line there seems to be an increasing demand.

The threatened strike of molders in Cleveland, Ohio, has been averted. Representatives of the National Foundrymen's Association and the Iron Molders' International Union held a conference and reached an understanding which was ratified at a mass meeting of the molders. Under the scale which expired August 1 bench molders received a minimum wage of \$2.65 a day and floor or machinery molders \$2.85. The demands of the men were for a flat advance to \$3.10 all around. Under the new agreement the bench men will be paid \$2.85 and the floor men \$3 a day. The agreement is for one year from August 1. Ten hours will constitute a day's work.

## CONDITION OF THE STOVE TRADE.

The stove trade in the East is enjoying what some characterize as a doubtful blessing. The number of stoves sold this year as compared with last shows a substantial increase, and shipments are now being made to meet the demands which are coming in rapidly from the dealers. This would seem to be cause for rejoicing, but the manufacturers claim that the business is being done without the profit that it should bring. This is more particularly true of cooking stoves, which make up the bulk of the business of the year. The prices on heating stoves are said to be satisfactory, some general advances having been made and independent advances being received by the trade without opposition. Some annoying influences have developed in the Eastern stove trade that have changed their base whenever the opposition to them has become sufficiently strong. It is unfortunate that the whole stove trade is not willing to profit by the experience and to act in concert to prevent these influences from reducing their profits. The larger proportion of the production of a stove foundry is cooking stoves, and when these stoves are sold at so narrow a margin of profit as to be generally spoken of as satisfactory it should not be difficult to secure concerted action that will change the conditions. There are not wanting those who believe that the price of stoves must advance still further owing to the increase in cost without any probability of an early cheapening in pig iron, labor or supplies. With these facts confronting them it would be well for stove manufacturers, particularly those in the East, to revive the old custom of meeting for the purpose of discussing conditions and adopting measures to conserve their interests.

The distribution of stoves from Chicago during the month has been very satisfactory to manufacturers and agents alike. In the aggregate the volume of business has been not only equal to the average of August but most manufacturers have experienced a slight increase. In one instance, at least, transactions have been one-third more in volume than at the corresponding time last year. However, the bright outlook of several weeks ago, which promised unusual activity in the stove trade at this time, pointing to a record breaker in the history of some concerns, owing to the excellent condition of crops throughout the country and the consequent anticipated large rural demand, has been somewhat dimmed by the scarcity and rise in the price of coal, due to the anthracite coal miners' strike. More especially have the ill results of this strike been felt by dealers making a specialty of and doing a large business in base burners and other stoves for heating purposes. But notwithstanding the fact that some large orders have been cancelled for this kind of stoves, general surprise is expressed that matters have not assumed a more serious aspect than they have, and common approval is uttered at the present satisfactory condition of the stove trade. The opinion is prevalent among large dealers that a fair volume of business may be expected during the coming fall and winter. The radiator trade has been active during the past month, and a good fall and winter business is expected, unless the scarcity of building material used in structures requiring such heating apparatus or unlooked for labor troubles should interfere with the present condition of affairs.

### Mott's Caldrons.

Catalogue No. 4, issued by the J. L. Mott Iron Works, 84-90 Beekman street, New York, consisting of 54 pages, is devoted to caldrons. The first article shown is a jacketed steam kettle, which is made with a cast iron body, and a copper kettle furnished with either a tinned or white enameled lining and designed to carry a steam pressure as high as 80 pounds. The kettles are made in a variety of sizes, the largest having a capacity of 3000 gallons. The portable caldron which follows consists of a cast iron furnace with cast iron or tinned copper caldrons. The furnaces are designed to use either coal or wood and the caldrons are made in from 10 to 200 gallons' capacity. White enameled caldrons are also furnished for these furnaces. Furnaces and caldrons

for melting lead and for various purposes are shown in different styles and in capacities varying from 10 to 20 gallons. Large crucible furnaces for melting brass are also shown.

Another line consists of portable wrought iron furnaces, mounted on wheels, for use in melting lead for calking the joints of cast iron pipes used for gas and water mains. Round and square caldrons and tanks coated with white enamel are presented and also wrought iron wagons for hauling varnish kettles, as well as steam tanks and covering plates, heavy fire doors and frames, solid dampers and grate bars, and cast iron flue linings for equipping furnaces for any kind of work. A furnace and pot for melting type metal, made by the company in three sizes having capacities for 250, 500 and 1000 pounds, is designed for using gas as a fuel. The last pages of the catalogue are devoted to large copper caldrons, copper jacketed steam kettles, varnish kettles and kettles for special work.

## NOMINATIONS FOR STOVE CAPTAINS.

In connection with the subject of "stove captains" we are glad to note the generous spirit shown among the members of the trade by the expressions of admiration which have reached us for those men who have achieved a notable success in this branch of industry. We present the following letters, received during the week, nominating other men who are estimated as worthy and capable of filling so important a position. One valued correspondent writes as follows:

Having seen in the last issue of *The Metal Worker* the nominations of some prominent Western men for "Stove Captain," I feel that Ohio has at least one man who is well qualified for a leader and who has already enjoyed the confidence of his *confrères* in a leading position—namely, Lazard Kahn, who has been the president of the National Association of Stove Manufacturers. Mr. Kahn has devoted some time to a study of what would be necessary to make a practical combination among the stove manufacturers and at different times has given interesting information on the subject, which is evidence of the conservative manner in which he would act should he be elected to head so important an enterprise.

Another letter, which is given below, comes from a Pennsylvania manufacturing company who are fully alive to the qualifications of the different men in their State for bringing large enterprises to a successful issue:

It is not uncommon to hear the statement made that Philadelphia is slow; but, unfortunately for the credit of those who make this statement, they fail to add that it is also sure. I make this preface to the nomination I would make for a stove captain. The city of Philadelphia has two men who are amply qualified to plan and carry out all that would be necessary should the stove manufacturers combine. One of these men is Franklin L. Sheppard. He has now had many years of experience in the stove trade, and those who are well acquainted with him know that he is a factor in the management of several other enterprises equally as important as the stove manufacturing business of which he is the head. Another man in Philadelphia has a record of increasing the sale of his productions until large plants have been recently extended and are now needed to supply the demands which come to his house. This man is Abram C. Mott.

In order to meet the rapidly increasing demands of their Stove Repair business, Green & Sons of Des Moines, Iowa, have found it necessary to add to their warehouse facilities. Extensive improvements have been made during the past year, but these have not been sufficient to keep up with the growing volume of their trade. The concern already have patterns for over 50,000 Stoves from which Repairs are made, and this number is constantly being increased.

### White's Stoves, Ranges and Heaters.

The fortieth annual catalogue and price-list of the Thomas White Stove Company, Fifth and York streets, Quincy, Ill., is a neatly printed volume of 112 pages, profusely illustrated and bound in flexible board covers, with gilt side title, the design consisting of a *fac-simile* of the company's trade-mark. In the arrangement of the matter steel ranges are first considered, the leading place being occupied by White's Maxim, a six-hole construction designed for using coal or wood as a fuel. It is fitted with Duplex grate, cast back flue, spring balanced oven door, sheet iron shield below the steel bottom to equalize the heat in the oven, pouch feed for coal, planished steel body lined with asbestos and steel and white enameled reservoir. Following this is White's Model steel range, also intended for using coal or wood and offered in a great variety of styles and sizes. Under the same name is presented an extensive assortment of steel cook stoves, all embodying features which cannot fail to command the attention of an intelligent trade.

Other lines of goods which the company have brought out are White's Peerless steel cooks and ranges, intended for using wood only as a fuel. These goods are said to be built strictly as a wood line and to have important advantages in the use of this fuel not to be found in combination patterns. Many varieties of cast goods are shown covering cook stoves and ranges, some being intended for using coal exclusively, while others are intended for burning wood. More than half of the catalogue is taken up with these goods, the remaining portion being devoted to heating stoves, of which White's Royal Princess is presented as a leader. This is a handsome Todd, made in two sizes and having reversible collar and automatic damper. White's Oak for coal and also for wood is shown, together with a varied assortment of air tight, laundry and box stoves. The catalogue concludes with a list of stove hollow ware, miscellaneous goods and a list of stoves not shown in the catalogue for which the company can furnish repairs.

### Gold Coin Stoves and Ranges.

We have received from the Chicago Stove Works, Blue Island avenue and Twenty-second street, Chicago, Ill., a copy of their thirty-first annual catalogue of Gold Coin stoves, ranges and heaters, which are manufactured in extensive variety. The matter consists of 72 pages of letter press, bound in colored paper covers, carrying, in addition to the name and address of the company, a *fac-simile* of the Gold Coin trade-mark. The frontispiece consists of a view of the company's works and among the early pages is a notice to the trade relative to ordering stoves, together with a statement of terms and a *fac-simile* of the warrant or guarantee which the manufacturers give with their goods. The leading place in the catalogue is given to the Domestic Gold Coin polished steel range, made in several series and adapted to meet varying requirements. The goods have stood the test for several years and embody features which render them popular with the trade. The Merit Gold Coin and Active Gold Coin, which are members of this general class, are designed for burning coal and wood and also for using wood exclusively as a fuel. The Gold Coin hotel steel range is made with double ovens and double fire box and has 12 boiler holes in the top surface. Following these goods attention is invited to the National and Champion Gold Coin polished steel cook stoves, the former being intended for burning coal and wood and the latter for using wood only. These are up to date constructions and are offered in a variety of sizes. Under the generic name Gold Coin is shown an extensive assortment of cast ranges and cook stoves embodying the modern improvements and offered in the usual modifications.

Among the heaters the Gold Coin Ventiduct base burner occupies the place of honor. This is offered in a new twentieth century dress and is so constructed that it can be used as a single or double heater, according to requirements. The Ideal Gold Coin Ventiduct base

burner for hard coal is a member of the same general class, while the Marvel Gold Coin is a medium priced base burner embodying all the essential features of the higher class goods. The closing pages of the catalogue are given up to sheet iron surface burners, oak, globe, cannon, cottage parlor, laundry, box and air tight stoves. Reference is also made to the Royal Gold Coin gas range, which has been brought out to meet the demand for a first-class construction at a moderate price.

### The Reineke, Wilson Company's Gas Stove Catalogue.

A very handsome catalogue, consisting of 68 pages, has just been issued by the Reineke, Wilson Company, Pittsburgh, Pa., illustrating the gas heating appliances made for the company by their manufacturing department operated at Johnstown, Pa., under the name of the Century Stove & Mfg. Company. This catalogue is No. 31. The contents comprise illustrations and descriptions of a great variety of gas stoves and of appliances to be used in connection with such stoves. The company call special attention to several new lines of heating stoves which they have brought out for this season, but more particularly the Franklin, Century and Orient, which are alluded to as goods of the highest merit, which they believe will meet with a ready sale. The Century line consists of reflector stoves, asbestos stoves and fuel stoves, the last named having the appearance of a coal fire and fire place heaters. The Orient stove is a construction strongly suggestive of a coal or wood stove, having a full square cast iron and sheet metal body, with a large mica door and an ornamental stamped steel top. The Franklin line comprises an asbestos open front and portable gas grates, consisting of a fire box surrounded by a frame.

Other stoves shown are the Keystone, with an asbestos fire back; the Mystic, which combines the important features of the atmospheric or blue flame burner with a reflecting surface; the Keystone Reflex, which has a planished copper sloping reflector; the Crescent, which has an asbestos flame plate and burns with a blue flame; the Iron City, which is a natural gas base burner; the Sunbeam copper reflector stoves; the Senate, which has an asbestos flame plate; the Bonnie, Star and Don cylinder stoves; the Majestic gas radiators; the Omega gas stove, which consists essentially of a special Bunsen burner inclosed in a cast iron dome; the Royal Queen, Empress, Corona, Regina, Crown and Regent fire place heaters, and the Keystone gas log fire. The catalogue further presents the Keystone gas furnace, which is designed for heating dwellings, stores and churches with warm air, and the Midget hall heater, which is a smaller warm air furnace. The appliances illustrated consist of gas logs, andirons, air moisteners, iron fronts, portable baskets, grate fillings for gas fires, natural gas burners, cook stove gas burners, furnace and boiler burners, wire guards, fire screens, stove pipe, &c. Illustrations are given of the company's Pittsburgh warehouse and of the factory at Johnstown.

### The History of Doe-Wah-Jack.

We trust the readers of *The Metal Worker* are following from week to week the history of Doe-Wah-Jack given in the advertisement of the Estate of P. D. Beckwith, Dowagiac, Mich. For many weeks an installment of the history has appeared in this advertisement. Undoubtedly our readers have been deeply interested in Doe-Wah-Jack and have been desirous of knowing something about this remarkable Indian. The Estate of P. D. Beckwith, therefore, undertook to meet this desire and engaged the services of a competent historian as well as most capable artists, and they have together evolved an exceedingly interesting biography. It is a question whether any other Indian ever secured so much attention and had his history so minutely portrayed as the redoubtable Doe-Wah-Jack, who now gives the luster of his name and achievements to spreading the glory of Round Oak stoves, ranges and furnaces.

### Some Hints About Advertising.

We have received from Jos. Leon Gobeille, president of the Gobeille Pattern Company, Cleveland, Ohio, a most interesting brochure of eight pages in an attractive paper cover, which is entitled "Some Hints About Advertising." This little publication is of a most suggestive character. It will undoubtedly stir up many of those who receive it to renewed efforts in advertising their business. Allusion is made to various methods of advertising, the trade paper coming in for its share of commendation. Stove manufacturers will be interested in the statement that probably the best advertiser ever known to the stove trade was Frederick W. Gardner. We quote from the circular: "Stove men knew what he had to sell and they wept as 'Fred.' made the universe believe that his brand was the only simon-pure blown-in-the-bottle sort in existence." An interesting letter to the Gobeille Pattern Company is reproduced verbatim. Our facilities in this office are not adequate to its reproduction, so we refrain. The concluding paragraph of the brochure is as follows: "The stove business is in general very inadequately advertised. Fred. Gardner, Fred. E. Lee and W. N. Moore have given examples of what may be accomplished by judicious advertising, and, in my opinion, any one of about 50 concerns could easily come to the top place by following their methods. This circular is *not* an advertisement."

### An Important Stove Suit.

At Pittsburgh this week the Pittsburgh Stove & Range Company filed a bill in equity against the Pennsylvania Stove Company, Lyman W. DeHaven, Addison C. DeHaven and John C. Roe, asking that the defendants be restrained from the manufacture and sale of stoves, ranges, furnaces, heating appliances and kindred manufactures for a period of five years, dating from September 1, 1899. It is alleged that on September 8, 1899, DeHaven & Co., Limited, made to the plaintiff a bill of sale whereby they sold to the plaintiff all the personal property of the company wheresoever situated, including the good will, cash, book accounts, &c. It is set forth that as a part of the agreement entered into by the contracting parties the defendants were not to engage directly or indirectly in the manufacture of stoves, ranges, &c., in Pennsylvania, Ohio and West Virginia for five years from the time of the signing of the agreement. The plaintiff avers that the defendants, contrary to this agreement, have erected a plant at Ellwood City, Pa., and are advertising the product as "DeHaven stoves and ranges." A preliminary injunction is asked for and afterward that it be made permanent."

### ODD PLATES.

THE plant of the Alabama Stove Company, Florence, Ala., is being rebuilt.

THE PHILADELPHIA STOVE COMPANY, with principal office at 419 Market street, Camden, N. J., have just been incorporated with a capital stock of \$250,000, for the purpose of manufacturing Stoves, &c. The incorporators are George H. B. Martin, William F. Erdell and F. H. Hansell.

THE SPENCE-BAGGS STOVE COMPANY, Martin's Ferry, Ohio, contemplate adding the manufacture of Gas Stoves to their line.

THE PHILLIPS & BUTTORFF MFG. COMPANY, Nashville, Tenn., have received from the Mississippi Industrial Institute and College of Columbus, Miss., a contract for a National Steel Range with a capacity of cooking food for 500 persons at a meal. There was considerable competition for the contract.

THE LENNOX MFG. COMPANY, Marshalltown, Iowa, have introduced some improvements in their Torrid Zone Coal Furnace and are offering the various sizes under the designation Series E. The Furnace is constructed with a sectional fire pot, made either of fire brick or cast iron, but has no connection with the hot air chamber, being inclosed with a solid steel body, thus preventing all danger of leakage of gas or dust by rea-

son of packed joints or cracked fire pot. The indirect radiator is made with a hanging partition in the center and extends from the top to 8 inches from the bottom. Near the top of this partition is a chamber which, when closed, causes the hot gases to pass down the inner side to the bottom and return to the top on the other side. In this way it is claimed that much of the heat that would otherwise pass to the chimney is retained in the Furnace. The company issued for distribution at the Iowa State Fair some interesting circulars relating to these Furnaces and to the Lennox Wood Furnace, which they also manufacture. They mention the fact that their trade is far ahead of last year and fully up to expectations.

THE PENINSULAR STOVE COMPANY, Detroit, Mich., are sending out a four-page folder describing the principal features of the Diamond Peninsular Steel Oven Cook Stove, which is made with four boiler holes in the top surface. Among the features to which especial attention is invited are square oven with asbestos covered top, which, it is claimed, equalizes the heat; nickel steel oven shelf; Never-Break steel oven rack, which is always clean and when placed on the oven bottom allows circulation of air under the pan; Never-Break steel base; nested griddle cover, which is furnished with every Peninsular Cook Stove or Range; large reservoir and a fire box fitted with heavy sectional linings and duplex grate. Reference is also made in the folder to the Economy Peninsular Steel Oven Cook Stove, using duplex or flat shaking grate. The claim is made that the steel oven gives 50 per cent. more capacity by baking on the oven rack and the oven bottom at the same time.

THE WESTERN STOVE COMPANY, LIMITED, with a capital of \$50,000, have applied for a charter in Ontario, Canada. The promoters of the new company are Frank J. Taylor, who for some years has been buyer for the Gurney Foundry Company of Toronto, and J. J. Cunningham, formerly superintendent of the company. The new concern have purchased the plant of the National Iron Works at Wingham, Ont., and expect to have Stoves and Ranges on the market this fall.

THE DETROIT VAPOR STOVE COMPANY, Detroit, Mich., have just acquired title to 95 feet of ground between Dequindre and Franklin streets, extending through to Woodbridge street. On this site the company intend to proceed at once with the erection of a large factory, the main building covering an area of 50 x 100 feet, with an addition of lesser size. The plans are being prepared by Architect Harry W. Chamberlain. The new building has been found necessary in order to give the company increased manufacturing facilities. Heretofore much of their product has been made to order, but we understand that it is the intention of the concern to make their own goods hereafter. Julien D. Dickinson is the president of the company, George H. Harris is treasurer, Paul D. Dulitz is secretary and John S. Sherman is manager.

It is stated that large numbers of Stoves made by the inmates of the Oregon Penitentiary are being shipped to San Francisco, and that members of the Iron Trades' Council are making a strong fight against the sale of the goods in that city. It is stated that Lowenberg, Going & Co., who handle the products of the Oregon State Prison, have changed the firm name to the Acme Steel Range Company of Boston.

AMONG the many advertising novelties sent out by the Michigan Stove Company is a wall match safe made of decorated tin, which they are furnishing their agents for distribution to housewives. It is ornamented with a *fac-simile* of the Garland trade-mark, and upon the receptacle for the matches is the inscription, "Compliments of the Garland Agency."

THE GREAT WESTERN STOVE WORKS, Leavenworth, Kan., have just received an order for two Banquet Cooking Ranges to be shipped to Norway. The order is from two Norwegians, who formerly lived in America and who have recently returned to their native country. The Stoves will be shipped to Akatieselskabet Skyerva, Aalesand, Norway.

THE CANTON PERFECT BLAST FURNACE is the subject discussed in a 32-page pamphlet which is being sent out

by the manufacturers, the Bonnot Company of Canton, Ohio. The Furnace is described at considerable length, special attention being given to the principal features of construction. A sectional view is shown, clearly indicating the passage of the products of combustion and hot gases through what is known as the secondary radiator, which is designed to retain the unused results of combustion until they give off their heat and thus utilize a large percentage that would otherwise escape to the chimney. Some hints on Furnace setting and management are presented, together with brief remarks on ventilation. Fully half of the pamphlet is given up to testimonial letters from some of those who have used the Furnace, the letters coming from widely scattered sections of the country.

It is stated that the Enterprise Stove Works, Vincennes, Ind., which were destroyed by fire in May last, will not be rebuilt, but everything available will be sold.

THE BORN STEEL RANGE COMPANY, Cleveland, Ohio, have commenced work on an addition to their plant, which will greatly increase their capacity.

WALTER A. CLARK of the Phillips & Clark Stove Company, and Joseph A. Quay of the Summit Foundry Company, Geneva, N. Y., attended the monthly meeting of the Stove manufacturers of New York State, which was held at Rochester on August 21.

CHARLES C. HEATH & Co., 136 and 138 North Second street, Philadelphia, Pa., send us a *fac-simile* of the premium tag which they are using on orders for Stove Repairs. To the dealer saving 200 of these premium shipping tags the company offer, free of charge, a 1000 mile mileage book on any railroad. The company state that they carry in stock Repairs for 20,000 different kinds of Stoves, Ranges and Heaters and that they also manufacture Asbestos Wick Rings for All-Blue Flame Oil Stoves. They are also sales agents for Aluminum and Electric Oil Heaters.

THE LINCOLN STOVE & RANGE COMPANY, with factories in Detroit, Mich., and Toledo, Ohio, have decided to locate another plant in Fremont, Ohio, where work has already been begun on the foundry and machine shops. It is expected that the concern will be in active operation early in the winter, turning out all kinds of Steel Ranges and Stoves. It is stated that 50 hands will be employed at the start.

THE NOYES & NUTTER MFG. COMPANY, 23-27 Central street, Bangor, Maine, have brought out a new Furnace in two sizes, having 22 and 26 inch fire pots and designed for burning wood or coal as a fuel. It is known as the Kineo Oak and has large radiator and dock ash grate, which can be readily removed for the purpose of making repairs. All parts are made of extra heavy castings, the fire pot is large and the radiator is made of heavy sheet steel.

THE MONARCH VENTILATOR No. 164 is referred to by the Monarch Stove Mfg. Company of Mansfield, Ohio, as a "calorific wonder." It has been improved for 1902 by substituting a cast iron fire box section in place of sheet steel, this step having been found advisable by reason of the intense heat generated. There are two 15-inch burners, with four rows of gas orifices in each, producing a fire which quickly sets the incandescent brick clinkers to glowing. The Heater stands 33 inches high, is 20 inches wide and has a depth of 13 inches.

THE READING STOVE WORKS, Orr, Painter & Co., proprietors, Reading, Pa., make a rather interesting announcement regarding the continuance of the hard coal miners' strike and call attention to the fact that they manufacture a complete line of Heating and Cooking Stoves constructed especially for using soft coal; also a line of wood burners. Special reference is made to their Mystic Sunshine Range, which is offered in the usual styles and sizes. This is the second season for this Range, and its popularity is said to be constantly growing.

THE BORN STEEL RANGE COMPANY, Cleveland, Ohio, refer to their Born Steel Plate Ranges as combining all the features necessary to make them high grade constructions. They have balanced oven doors, with tough malleable iron frames, double steel plate bodles inter-

lined with asbestos, reversible duplex grates, which can be used for coal or for wood, patent removable oven bottoms that do not warp and cast shields at the sides of the top flue to retain the heat and protect the joints between the walls and oven.

CHARLES C. HEATH & Co. of Philadelphia and Baltimore, manufacturers and jobbers of Stoves, Ranges, Furnaces and Stove Supplies, advise us that they will mail an attractive souvenir on the first of the year to all dealers whose names are on their books during 1902.

WILLIAM G. WILLARD, 619 North Fourth street, St. Louis, Mo., is offering last year's pattern of his 400-pound Willard Steel Range at a figure which cannot fail to command the attention of dealers generally. The low figure is named in order to close out this pattern, as the patterns for his 1902 line have now been completed. The Willard Steel Range referred to has six 8-inch covers, a top cooking surface measuring 30 x 36 inches, duplex grate and large oven. Descriptive circulars have been issued by Mr. Willard calling attention to the essential features of construction.

THE WALKER & PRATT MFG. COMPANY, Boston, Mass., state that the unusual demand for Crawford Ranges and other goods made in their factory has rendered it necessary for them to double their melting capacity. They have therefore added a second cupola to their equipment. With both cupolas in operation they can now melt 50 tons of Pig Iron a day. The shipments of Crawford Ranges for the months of June and July are said to have shown an increase of more than 80 per cent. as compared with a year ago. The above and much other interesting information relative to the Crawford goods is contained in the "Two Cupola number" of the *Crawford News*, a four-page folder which the company occasionally issue for circulation among the trade.

WE have received from Henry Gleason, 258 Broadway, New York City, a heavy cardboard poster illustrating some of the many specialties for which he is agent. The list includes the Standard Oven Indicator made by the Helios-Upton Company of Peabody, Mass.; Stove Trimmings, turned out by the Matthews Mfg. Company of Worcester, Mass., and the Swedoh Cold Rolled Steel Nickel Plated Stove and Range Trimmings made by the American Tube & Stamping Company, Bridgeport, Conn., successors to the Wilmot & Hobbs Mfg. Company. The specialties of this concern include Oil and Gas Stove Domes, Feet, Rings and Sections, Angle Irons for corners of steel ranges, Brackets used for warming closets, Range or Edge Bands of every description and Nickel Plated Tubing for Towel Rods. The card is printed in two colors with a red cord for hanging it in a conspicuous place.

A FOUR-PAGE folder, which is being sent out by the Simpson Stove & Mfg. Company, Pittsburgh, Pa., makes the announcement that "the time to get ready for business is when business is getting ready for you—or for your competitor. Now is the time to be ready to get more than your share of the season's Gas Heating Stove business." The folder also refers to the fact that the Simpson line, taken as a whole, is an excellent seller by reason of its efficiency and economy and because it possesses unique points of merit which, it is claimed, places it far beyond the reach of competition. Special attention is directed to the Simpson Multiple Action Stove, which is fitted with a one-piece corrugated fire pot, affording a great amount of heating surface and positively preventing the gases from mixing with the hot air and escaping into the room. The folder is intended for sending through the mail. The part to which the postage stamp is attached carries the picture of a district messenger boy seated on a box on the sidewalk puffing a cigarette and reading a yellow covered novel entitled "Wild Dick." At his side on the walk is a telegram marked in large letters "Rush." With this picture on its face it is not surprising that the circular should bear the suggestive title, "You Had Better Hurry." It refers, of course, not so much to the district messenger boy as it does to the dealer who has not made proper preparations to handle a large Stove business.

### Imperial Roller Towel Rack.

The Franklin Specialty Company, 627-631 Franklin street, Reading, Pa., are the manufacturers of the Imperial roller towel rack shown in the accompanying cut. It consists of brackets, rod and screws, all finely nickel plated, and is adapted for use in bathrooms, kitchens, closets or any desirable place. The rack presents a neat appearance and sells at a moderate price. The Franklin Specialty Company, who have recently

*Imperial Roller Towel Rack.*

moved into their present plant, are manufacturing a line of high grade nickel plated hardware and household specialties.

### The New England Food Chopper.

Illustrated herewith is a food chopper put on the market by the Smlth & Hemenway Company, 296 Broadway, N. Y. Referring to the chopper, the company state that all cutting surfaces are ground, insuring perfect accuracy at the most essential points, and that all parts are made to gauge, are interchangeable and that duplicate parts can be furnished at any time. The three self sharpening knives shown at the side of the chopper vary in degree of fineness, allowing coarse, medium or fine chopping, as desired. The use of the lid does away with the necessity of pressing the food to be cut against the screw with the fingers. Among the points of excellence the following are mentioned: That the chopper is simple in construction, easily cleaned and easy to

*The New England Food Chopper.*

operate; that all of its cutting edges are sharp and its knives self sharpening; that it is heavily coated with pure tin, preventing corrosion; that the machine cuts and does not bruise, mash or tear the food; that the food is carried forward by the screw from the hopper to the front end of the case, where it is cut by the sharp edges on the inner side of the discharge openings, and is then severed into pieces of the desired size by the final cutting of the outside steel knives. The chopper can be used, it is explained, to chop raw or cooked meat, chicken, turkey, game, lobster, oysters, clams, tongue, giblets, suet, figs, citron, raisins, apples, nuts, spices, potatoes, cabbage, onions, carrots, celery, parsley, horseradish, slaw, &c.; also in preparing beef tea, sausages, puddings, soups,

mincemeat, hash, stuffings, sandwiches, relishes, salads, fruit and nut cake, chow chow, gravies, veal or chicken loaf, Welsh rabbit, croquettes, potted meats, fish cakes, cracker dust, bread crumbs, patties, fruit sauces, &c.

### Keeping Dampers.

Instead of hanging dampers on wires, as is the custom in so many shops, G. H. Wheeler, Seymour, Conn., uses

a little stand in which there are four bins. This is made of rough lumber, but serves its purpose admirably. In the top compartment are kept 4½ and 5 inch dampers; in the next are 5½-inch, in the next 6-inch and in the bottom space 7-inch dampers. The sizes are plainly

*Keeping Dampers.*

marked on the front of the bins, as shown in the accompanying illustration.

### Cream City Ware.

An illustrated catalogue and price-list of 264 pages has just been issued by Geuder & Paeschke Mfg. Company, St. Paul Avenue and Fifteenth street, Milwaukee, Wis. The publication covers their products under the generic name of Cream City ware. Following the introductory pages, views are presented of the company's establishment at different stages of their existence, from the year 1880, when it is shown in a small two-story store building, up to the present year, when it occupies two city blocks. A complete alphabetical index of the goods included in the catalogue occupies six pages at the beginning of the catalogue. The catalogue is divided into seven departments covering respectively pieced tinware, to which about 90 pages are devoted; anti-rust tinware, sheet iron ware, stamped ware, japanned ware, miscellaneous goods and enameled ware. The illustrations in the last named department are in the natural colors of blue and gray in which the ware is manufactured. The catalogue is profusely illustrated with good engravings and covers all the various lines of goods known on the market in the various qualities of finish indicated above.

Among the specialties made by the company are Cream City cream cans and railroad milk cans; also the

Badger railroad milk cans with all kinds of dairy supplies. The Cream City Anti-rust tinware covers, dish pans, tea kettles, wash boilers, bowls, drinking cups, cream cans, dairy pails, &c. A fine line of black and galvanized sheet iron ware embraces wash boilers, Cream City baskets, garbage and ash cans, well buckets, oil cans, gasoline cans, stove pipe, roof top caps, chimney thimbles, stove drums, four-piece adjustable and corrugated elbows, oilers, coal hods and grain measures, water pails, roasting pans, wash tubs, fire shovels, &c. The stamped ware, of which the company make a long line, occupies over 40 pages, which are followed by a line of japanned ware, including wash bowls and pitchers, minnow buckets, fishing tackle boxes, flour boxes, bread, cake and spice boxes, folding lunch boxes, cuspidors, trays, chamber pails, dust pans, bathtubs and many other goods. Some handsome decorated toilet sets are also included. The company's line of blue and gray enamel ware completes the book.

### Stove and Hardware Dealers.

AMONG the concerns recently incorporated are the Winn Mfg. Company of Kansas City, Mo., with a capital of \$50,000. The new company will deal in Stoves, Furnaces and Hardware and the incorporators are D. F. Winn, E. Etzenhauser and John Seaford.

THE Stove and Tinware store of Spiro & Long, at 1920 Third avenue, Birmingham, Ala., was recently visited by a disastrous fire which damaged their stock and building to the extent of about \$15,000.

S. A. FOOTE & SON have succeeded S. A. Foote in the Stove, Hardware, Agricultural Implement, Wind Mill, plumbing and furniture business in Parkersburg, Iowa. The new firm have remodeled their furniture department and have made additions to their entire stock.

BUTLER & HAGAMAN have succeeded Wm. Butler in the retail Stove, Tinware, Hardware, Agricultural Implement and Sporting Goods business in North Branch, Mich.

THE second annual picnic of the employees of F. E. Myers & Bro., Ashland, Ohio, was held on Saturday, 16th inst., at Silver Lake. More than 2600 excursionists participated, and the occasion was a most successful one in every respect. The company refer to the attitude of their employees and friends as exceedingly complimentary, and the interest manifested in the picnic as showing a state of affairs that is highly appreciated by the concern, demonstrating, as it does, that the relations between employers and employees are exceptionally cordial. On Monday evening, 18th inst., at the residence of F. E. Myers, a reception was tendered to P. A. Myers, who had just returned home after an absence of over two months, during which time he visited England and the principal European countries.

MOORE & HAWKINS is the name of a new firm who will do business at the former stand of Orton, Smith & Moore, Elgin, Ill. Messrs. Orton and Smith have withdrawn from the firm, and Leo Hawkins has entered into partnership with Mr. Moore under the above style. Mr. Hawkins studied civil engineering at the University of Michigan, leaving there about a year ago to accept a position in the bridge department of the Chicago, Milwaukee & St. Paul Railway. The firm expect to put in a new store front, new fixtures and to largely increase the stock, which comprises Shelf Hardware, Stoves and Tinware, with heating, plumbing, furnace work and gas machine department.

W. J. VANPETTEN has bought the Stove, Tinware, Hardware and Sporting Goods stock of John Stanley at Elmwood, Ill., and will continue this long established business at the old stand. Mr. Van Petten has been identified with the lumber business of Elmwood for the past ten years.

E. L. RASBERRY has succeeded Hamilton & Rasberry in the retail Stove, Tinware, Hardware, Agricultural Implement and Wagon and Buggy business in Rockdale, Texas.

KUTSCHBACK, HOLMAN & HOCH, in the wholesale and retail Stove, Hardware and Implement business in Tay-

lor, Texas, have been succeeded by the Holman & Hoch Hardware Company.

THE HUGHES HARDWARE COMPANY have engaged in business at Cushing, O. T., handling Stoves, Tinware, Shelf and Heavy Hardware, Paints, Harness and Sporting Goods.

D. J. BOND has opened a new store in Prague, O. T. Mr. Bond's stock comprises both Tinware, Stoves, Shelf and Heavy Hardware and Agricultural Implements.

M. M. TULLIS & Co., Driftwood, O. T., have opened a general store, handling Stoves, Hardware, Farming Implements, groceries, &c.

W. A. ROACH has purchased the Stove, Hardware and Agricultural Implement business of J. M. Summer & Son, Paris, Texas.

WEIGHT HARDWARE COMPANY, Rosebud, Texas, have been incorporated with a capital stock of \$20,000. The company are dealers in Stoves, Tinware, Shelf and Heavy Hardware, Agricultural Implements, Sporting Goods, Buggies, Wagons, Wind Mills, &c.

HENRY & ROBERTS BROS., a stock company with a capital of \$12,000, have succeeded J. L. Henry in the Stove, Hardware and furniture business in Centralla, Mo. They are erecting a new brick building, 50 feet wide and 100 feet long, two stories high.

THE Stove, Tinware and Roofing establishment of S. Spiro, Birmingham, Ala., was destroyed by fire last week. The loss is estimated at \$10,000, partially covered by insurance.

### Soldering Aluminum.

Much has been written about the soldering of aluminum and a number of aluminum solders have appeared on the market, but as a matter of fact a perfect solder, which not only will do the work of joining the white metal but will withstand the test of time and use, is yet to be found. An apparently well-soldered joint will frequently corrode after a few months' exposure to the atmosphere. Moreover, none of the existing solders will flow into the joint by capillary action, but must be placed upon the surface of the metal. The following directions for soldering aluminum given by the *American Blacksmith* furnish, however, some useful hints that may prove of interest and value to some of our readers:

Small surfaces of aluminum can be soldered by the use of zinc and Venetian turpentine. Place the solder upon the metal together with the turpentine and heat very gently with a blow-pipe until the solder is entirely melted. The trouble with this as with other solders is that it will not flow gently on the metal. Therefore large surfaces cannot be easily soldered.

J. S. Sellon patents the following method: Clean the aluminum surfaces by scraping, and then cover with a layer of paraffine wax as a flux. Then coat the surfaces by fusion with a layer of an alloy of zinc, tin and lead, preferably in the following proportions: Zinc, 5; tin, 2; lead, 1. The metallic surfaces thus prepared can be soldered together either by means of zinc or cadmium, or alloys of aluminum with these metals. In fact, any good soldering preparation will answer the purpose.

A good solder for low grade work is the following: Tin, 95; bismuth, 5. A good flux in all cases is either stearin, vaseline, paraffine, copaiba balsam, or benzine.

In the operation of soldering small tools made of aluminum are used, which facilitate at the same time the fusion of the solder and its adhesion to the previously prepared surfaces. Tools made of copper or brass must be strictly avoided as they would form colored alloys with the aluminum and the solder.

United States Consul Frank D. Hill of Amsterdam, Holland, states that he is prepared to receive from American manufacturers and exporters copies of their catalogues, as he intends to devote a room in the Consulate exclusively to circulars and catalogues of American firms, folders of American railways and steamship lines, &c. The Consul states that he has received many visits lately from people interested in the import trade who desire data in regard to United States industries.

### The Slocomb Sheet Metal or Rubber Gauge.

The gauge designed by J. T. Slocomb & Co. of Providence, R. I., differs from other micrometers in several important points. The thimble makes but one revolution in measuring the full extent of its range— $\frac{1}{4}$  inch—

The Slocomb Sheet Metal or Rubber Gauge.

and there is but one scale of graduations, which are all on a dial in plain sight. The lead of the measuring screw is so great that there is not much chance of measuring differently on account of different degrees of pressure on soft material. The instrument is held and

Fig. 2.—Details of the Slocomb Gauge.

operated entirely by one hand, leaving the other free to hold the work. Neither of the measuring points revolves, which is an advantage when gauging soft or sticky material.

The construction is plainly shown in the drawings, Fig. 2. The thimble D has an internal thread  $\frac{1}{4}$  inch long. The enlarged end of the sleeve E has an external thread to fit the thimble, but  $\frac{1}{2}$  inch long, thereby allowing the range of travel to come on the external thread, which

is accurately cut. The thimble has also a plain bore at F which fits loosely an enlarged part of the sleeve E, excluding all dirt from the screw threads. This screw thread is multiple cut 32 P., but  $\frac{1}{4}$ -inch lead. The plunger G has two bearings in the sleeve E, one in enlarged bore in the thimble end and one in the bushing near the measuring cap, and slides freely through these bearings, but is prevented from turning by a small key working in a keyway in the sleeve E. The pointer H is clamped to the end of the plunger and does not revolve, but the dial revolves under it. The dial is attached rigidly to the thimble. Surrounding the plunger and inside of the sleeve there is a spring, J. This spring is under compression and torsion and takes up backlash in the screw threads, also on the thrust of the plunger inside of the thimble, and by its torsion keeps the key bearing on one side of its keyway and thereby preventing the pointer from shifting its position on account of some looseness in the key fit. The gauge is held with the handle K resting in the palm of the hand, with the thumb and forefinger on the thimble and the other fingers on the sleeve E, in which position the thimble is quickly and easily operated by thumb and forefinger. The adjustment for wear, except what is taken care of by the spring, is made by shifting the pointer.

These gauges are made with small points adapted for measuring metal, and also with differently graduated dials, some in thousandths of an inch and others to correspond with the different wire gauges.

### Keystone Crocodile Wrenches.

The Keystone Drop Forge Company, Philadelphia, Pa., are placing on the market a new line of steel drop forged wrenches, known as the Keystone Crocodile wrenches, which we illustrate herewith. These wrenches, they advise us, are drop forged from the same grade of pipe wrench steel as is used in other patented wrenches, and which permits of the jaws being tempered and hardened without danger of the teeth either flaking or crushing, as would be the case if such goods were made

Keystone Crocodile Wrenches.

from a grade of steel in which the carbon was unevenly distributed. The handles are designed with a flute on each side, thereby giving a better grip to the fingers of the user as well as a broader edge for the resistance against the hand. Another feature of these goods is that they are made solid throughout and not built up by welding a handle to the head and welding an inserted tool steel jaw to a soft steel head. The wrenches are being made in three styles, as shown by the cuts. No. 1  $\frac{1}{2}$  is 5  $\frac{3}{4}$  inches long; Nos. 2, 3, 4, 4  $\frac{1}{2}$  and 5 range from 9 to 27 inches long and are made with a solid handle. The twin wrench is made only in 10-inch length.

Professor A. G. Bell is quoted as predicting that wireless telegraphy will never supplant wires in land service on account of the interference of the various stations. He considers the supremacy of the wireless method much more probable for transoceanic systems. Marconi reports having received messages on the Italian flagship "Carlo Alberto" which were sent from Cornwall across England and a portion of Denmark. The distances were from 850 to 1400 miles. It is reported that a submarine torpedo boat at Cherbourg, France, fitted with a mast and wireless telegraph receiver, received distinct signals from a central station. The distance is not stated.

## JOURNEYMEN PLUMBERS' ANNUAL MEETING.

The annual convention of the United Association of Plumbers', Gas Fitters' and Steam Fitters' Helpers, held last week in Omaha, Neb., adjourned on Saturday, after having elected the following officers to serve for the ensuing year:

*President*, William M. Merrick, Beverly, Mass.

*Secretary-Treasurer*, I. W. Tilden, Chicago.

*Grand Organizer*, William J. Spencer, Sioux City, Iowa.

*Auxiliary Secretary*, W. Burke, Chicago.

Birmingham, Ala., was chosen as the place for meeting next year. The convention was attended by more than 100 delegates. The salaries of the president, secretary-treasurer and grand organizer were readjusted, and each official in future will receive a salary of \$1500 a year. The revised constitution and by-laws presented by the committee appointed at the last annual convention will go before the local lodges for a referendum vote on October 27.

The report of Secretary Tilden showed that on June 30 the end of the association's fiscal year, the membership was 14,789, an increase of 2987 members over last year. In the interval the number of local unions had grown from 280 to 339, an increase of 59 unions. Among the changes recommended in the constitution was one to the effect that no local lodges can go out on strike without the consent of the National Association, any lodge doing so forfeiting all strike benefits. This is expected to minimize the number of strikes. As authorized by the association, strikers will be paid \$5 a week for the first 16 weeks and \$3 a week after that. The sick members of the association can draw to the extent of \$5 a week for 13 weeks. The superannuation benefit will pay those who have been members for 20 consecutive years, \$300; 25 years, \$400, and 30 years, \$500. In order to pay these benefits the committee propose a weekly tax of 30 cents upon each member.

## Richmond, N. Y., Plumbers' Outing.

Richmond Branch of the Association of Master Plumbers of New York City outdid itself last Tuesday in the way it entertained its friends and members at the clam bake given at Silver Lake Park. The bake, although a little late in being served, was all right when it got there. Business Manager D. S. Melville was in charge of the service and soon had everything "coming his way." A novel feature was the naval battle on the lake between Admirals Brown and Macdonald, two of the distinguished guests.

The various New York City branches were represented by A. H. Brown, B. F. Donohue, I. J. Brown, Philip Brady and W. M. Lockwood of Manhattan; Ed. Macdonald of Brooklyn and J. V. McEvily of the Bronx. Messrs. Macdonald and Jones represented the Examining Board. Park Commissioner Kohlmann, Inspectors Silles and Lantry and other officials were present.

The following houses in the supply trade were represented: F. N. Du Bois & Co., John Simmons Company, Behrer & Co., J. L. Mott Iron Works, Cleveland Faucet Company, Boynton Furnace Company, A. L. Perkins of Jersey City, Gorton & Lidgerwood, Henry McShane & Co. and Hull, Camp & Co. Among the Richmond plumbers attending were W. J. Barry, E. D. Clark, T. E. Halloran, Fred. Rauscher, E. Savenhaur, Daniel Barnes, W. T. Warren, M. Lewis, John Duff, T. F. Santry and C. R. Heap.

A MOVEMENT is reported to be on foot among the journeymen plumbers throughout the State of Massachusetts toward allowing the journeymen to make their own lead traps and to line tanks for closets, instead of using the goods in this line furnished by the wholesale dealers. Formerly the work of lining tanks and making traps was done by the journeymen. This afforded the men considerable employment. It is claimed, in support of the demand of the men, that the lead traps and tank linings furnished by the dealers are often of such flimsy char-

acter that they last but a few months, while the work done by the journeymen was of a more substantial character. It is said that a convention of the journeymen's unions in Massachusetts will be called for the purpose of taking action on this matter.

## Pathfinder Portable Acetylene Generator.

A new type of portable acetylene generator has been placed on the market by Henry Giessel & Co., Chicago, as herewith illustrated. The apparatus, in which lump carbide is used, it is explained, is a departure from other types of generators, inasmuch as it has no gas bell and maintains an even pressure without any mechanical regulators. When the generator is charged its action is governed entirely by the gas tips or burners throughout the premises. Turning on one burner, then turning on two burners, it will generate proportionately for the two as for one, three, five or as many lights as are required, under the same low pressure at all times whether with one light or many. The method of supplying the carbide with water to insure a positive and uniform pressure, is as follows:

Inside the generator chamber is placed the carbide

Pathfinder Portable Acetylene Generator.

cup, which has the requisite number of small tubes to conduct a sufficient quantity of water to the carbide in the cup, when the carbide will be decomposed and the gas formed. The pressure of gas at this period of the process being light and the water pressure being the strongest, water is forced into the carbide cup (through the small tube or tubes) and generates gas at once, but as the pressure of the gas becomes stronger it shuts off the flow of water, forcing it back into the water tank. When the pressure of the gas decreases, as it is consumed through the burner, the water will again flow back through the tubes. This action will be repeated automatically until the carbide is all consumed and the water will then flood the carbide bucket, thereby decomposing all carbide and leaving no odor in the generator whatever. The operation of the machine, it is pointed out, is not in the least affected by any jolting, jarring, or rolling action, or any motion short of completely overturning, and hence it is peculiarly adapted for locomotive headlights, yachts, launches, stereopticons, car lighting, tents, lunch wagons, camping parties, lawn parties, stores, night work for construction, &c.

The machine is made in five sizes for operating from one to ten lights, is built strongly and the makers claim that it will stand any use to which an apparatus of this type is subjected.

### The Columbus Gas Arc Lamp.

Since the advent of the electric arc light considerable annoyance has been experienced by its occasional failure and its periodical cessation of illumination. This has caused many to continue the use of gas for illuminating purposes, and has also been the incentive for the manufacture of gas lights of strong illuminating power. In the accompanying illustration, we present a general view of the Columbus gas arc lamp, which is adapted for burning either manufactured or natural gas. These lamps are made by the Federal Mfg. Company, 162 West Long street, Columbus, Ohio, in a variety of styles adapted for both indoor and outdoor use. They are claimed to be constructed upon scientific principles and to be unapproached in quality, appearance and brilliancy of the light. All parts are made with a view to strength and durability as well as to increase the illuminating effect of the gas burned. The lamp is provided with a patent burner and a pilot jet lighter. The burner has a special long Bunsen and needle point adjustments, with a nickel plated steel gas supply pipe and a protecting sleeve. In operation it is said to be economical in the use of the gas while having a strong arc light effect.

*The Columbus Gas Arc Lamp.*

The construction enables the globe to be lowered for cleaning when the Bunsen with mantle in position can be removed and the gauze brushed or broken mantles replaced. The outdoor lamp can be as readily attended to, and is said to stand storms of all characters without effecting its operation. A catalogue devoted to these lamps, which are specially adapted for lighting churches, halls, factories and factory grounds as well as residences, has recently been issued by the company and can be secured on application.

### The Billow System of Fuel Oil Appliances.

Since the discovery of oil in new fields, the interest in appliances for its use as fuel has increased. A 39-page catalogue devoted to the Billow system of fuel oil appliances sent out by the National Supply Company, 315 Dearborn street, Chicago, will appeal to the trade who are interested in devices for making oil available as fuel, under conditions which render its use both satisfactory and serviceable. The Billow system atomizes the oil and can be operated by steam and compressed air. It is so constructed as to require but a minimum of either air or steam to thoroughly separate the oil into small particles so that it can be readily burned with an intense heat without choking, clogging, dripping or being wasteful in either the use of steam, air or oil. The apparatus is constructed of brass by skilled workmen and is designed so that the oil supply can be governed exactly. In appearance the Billow atomizer resembles a cross fitting, one branch receiving the air or steam and another the oil, while a third receives the regulating

governor and the fourth branch is designed to be inserted into the chamber in which the heat is to be generated.

The catalogue shows, in addition to the atomizer, tuyeres, tuyere blocks and the atomizer connected with both steam and air blast; also fuel oil pumping systems, both duplex and single for bringing the fuel to the furnace chamber where it is to be burned. A feature of the publication is a partial list of customers whose plants have been equipped with this system of fuel oil burning. The catalogue also contains tables showing the comparative cost of evaporating 1000 pounds of water with both coal and oil at different costs. It is accompanied by a pamphlet entitled "Fuel Oil and Its Relative Heating Values," compiled by C. O. and E. E. Billow, consulting engineers, which gives interesting information to those who are contemplating the equipment of their boilers and power plants with fuel oil systems.

### Quincy, Mass., Master Plumbers.

The first annual meeting of the Master Plumbers' Association of Quincy and vicinity, was held at the Grand Army Hall, Quincy, Mass., on Friday, August 15, when the following officers were elected to serve during the ensuing year:

*President, M. F. Corbett.*

*First Vice-President, A. E. Damon.*

*Second Vice-President, D. J. S. McCurdy.*

*Secretary, D. H. Keniley.*

*Treasurer, J. E. Luddon.*

The association now numbers 14 members, and bids fair to prove a highly successful organization.

### Standard Boiler Catalogue.

Heating contractors throughout the country are now receiving the latest catalogue devoted to the Standard steam and hot water heating apparatus made by Giblin & Co., Utica, N. Y. The new catalogue consists of 40 pages printed in red and black. The title-page is followed by a notice as to terms, shipments and ratings. In the introductory note attention is called to the essential features of the company's apparatus—namely, vertical circulation, thin water ways, large fire surface, long fire travel and the arrangement so that the travel of the water comes in contact with a constantly higher heated surface as it passes through the boilers. Another feature is the ease with which the heating surface can be cleaned after use, thereby preventing a reduction in heating efficiency. The first portion of the publication is devoted to the Standard vertical sectional return flue steam and hot water heaters, followed by the Standard round boiler, consisting of a water leg and feed section exposing a large heating surface and surrounded by a casing, forming a flue for effecting an indirect fire travel. The 20 Series Standard is a boiler of similar construction just put on the market which the company feel assured will win for itself the popular support of the heating trade and their customers. Two pages are devoted to general directions and useful hints for designing and preparing steam and hot water heating systems. The last 20 pages are occupied by a series of testimonial letters from satisfied customers in various parts of the United States showing the adaptability of the Standard boilers for buildings of all characters and fuels of all kinds.

A CATALOGUE by the A. P. Smith Mfg. Company of Newark, N. J., deals with Pipe Fitting Machines for making valve connections and for inserting corporation cocks, and also with their Standard Compression Fire Hydrant, with sliding frost case. The Smith Tapping Machine has been pronounced a most serviceable and economic water works tool by eminent hydraulic engineers, and is made in four sizes, which embrace all cast iron pipe sizes from 2 to 48 inches inclusive. With these machines connection can be made with water, oil, gas or steam mains, without reducing the pressure of any size not exceeding the diameter of the main.

## A COMBINATION HOUSE TANK.

BY HELMAR.

A combination house tank, installed some time since by the writer in a country residence, fulfils some requirements of the house owner that may be of interest to the reader. The house is of heavy frame construction with stone cellar and foundation walls. The roof is a gambrel roof, with the greater part of it forming the flat slope next the comb, as seen in Fig. 1. This gives considerable room in the loft near the outer walls and causes the flat slope to catch most of the water that falls on the roof, which is covered with slate. The

Combination House Tank.—Fig. 1.—Broken View Showing Valley. Inlet and Outlet Pipes.

architect had no thought of the plumber when he made the plans, but these conditions are all favorable and were taken advantage of in locating the tank, as indicated in Fig. 1.

The area of roof drained by the valley of the flat slope was thought sufficient to supply the tank, except in very dry seasons, and as the tank was to take water directly from the roof it was placed so that a large oval pipe could be run straight down into the tank from the point where the valley changes into the steep slope. This opening in the valley has a hood projecting upon the lower side to make all the water from the valley go down into the tank, and the opening is fitted with a wire basket. This plan not only makes possible discharging directly into the tank, but also avoids the mass of leaves, straw, &c., that would have to be contended with if the water was led to the tank from the cornice gutter. It also permits discharging the overflow, which is one-fourth larger than the pipe leading from the roof

Fig. 2.—Arrangement of Tank and Pipes.

to the tank, directly into the cornice gutter, as indicated in Fig. 1.

The tank, the principal features of which are shown in Fig. E, is 12 x 8 feet and 3 feet deep, giving about 1800 gallons capacity below the bottom of the overflow. The tank is divided in the center to make two compartments, 4 x 12 x 3 feet. It is keyed by tie rods running both ways, the 8-foot rods passing through the casing in both divisions. The two 12-foot rods are placed just high enough for their casing pipes to lie on and be supported by the casing pipes of the 8-foot rods. The wood of the tank is clear white pine, 2 inches thick, with feather joints, and the lead lining is wiped in. As shown by Fig. 2, water enters the tank from the roof through C and overflows to the cornice gutter through D. The water in this part of the tank is termed "unfiltered."

half way up the division wall the water can flow into the other half of the tank through a rectangular opening covered with wire gauze, shown at E in Fig. 2. Water in the latter part is called "filtered." That which flows in from the roof has been merely settled and strained more or less. That which is supplied by the house force pump is from a cistern and was actually filtered as it passed to the cistern from the roof. Placing the opening in the tank division half way up from the bottom, as indicated by A, reserves half the water of the unfiltered side, at all times, for fire purposes, pipe B being run down to the basement, with automatic valve and reel of hose on each floor.

## Thatcher Steam and Hot Water Heaters.

The Thatcher Furnace Company, 240 Water street, New York, have issued an illustrated price-list of their steam and hot water heaters, radiators and specialties. It is of pocket size, which enables it to be readily carried so as to be available for instant use. A full page is given to dimensions, ratings and prices of each type of boiler manufactured by the company, comprising the Thatcher sectional steam heater, Thatcher sectional hot water heater, Comfort steam heater, Comfort hot water heater, Empire steam heater, Empire hot water heater and Sterling hot water heater. The Thatcher two column, three column and Utility radiators receive ample treatment, a full list of sizes being given. Other specialties considered are the Thatcher steam radiator valves, hot water radiator valves, air valves, expansion tanks, floor and ceiling plates, &c.

## The Fowler & Wolfe Wall Radiators.

The Fowler & Wolfe Mfg. Company, 668 and 670 Bourse Building, Philadelphia, Pa., have issued a fifth edition of their catalogue of ornamental wall radiators. The Fowler & Wolfe radiator is a special construction to be attached to a wall, so that absolutely no floor space is occupied by the radiator. These radiators are intended for either steam or hot water, are ornamental in appearance, have been ingeniously designed so that they may be easily applied to any wall space available and have now been in use for a sufficient length of time to demonstrate thoroughly their remarkable efficiency. They are made in four sizes, which have been found to cover all requirements. The catalogue is exquisitely illustrated, showing practical applications of the radiator in a great variety of locations and also giving photographic reproductions of buildings which are equipped with this class of heating apparatus. The catalogue further contains lists of buildings in many cities in which the Fowler & Wolfe radiators have been installed, comprising churches, educational institutions, hospitals and asylums, public buildings, mercantile buildings, hotels and apartment houses, as well as numerous residences and steamships.

## The Twentieth Century Gas Producing Apparatus.

The C. M. Kemp Mfg. Company, Baltimore, Md., have issued an illustrated catalogue which fully describes a gas producing system brought out by this company under the name of the Twentieth Century gas apparatus. This is designed for the production of gas from naphtha, which can be utilized for factory fuel gas, for illumination and for all other uses. It is claimed that by this system an absolutely uniform quality of gas is produced automatically, irrespective of the demand for gas, whether continuous for days, weeks and months, or for an intermittent demand for a few minutes at a time. Absolute safety and simplicity are also among the strong claims made for this system. It can be installed where there is no yard space and can be placed inside the building. A specially interesting feature of this method of manufacturing gas is the statement that it makes gas at less than one-half the cost of city gas.

## THE NETHERY HYDRAULIC FLUSH VALVE.

Many changes have been seen in water closet construction and equipment in the past decade, and one of the latest and most popular changes has been the substitution of the flushing valve for the flushing tank. In the accompanying illustration we present some features of the Nethery hydraulic flush valve, made by the Nethery Hydraulic Valve Company, 29 Broadway, New York. An important feature of this valve is that it both opens and closes under and by direct hydraulic pressure, consequently grit and deposits are flushed away and therefore have no effect on its operation. The valves are made of high grade metal and are so constructed that they can be regulated to the proper amount of water required for flushing a closet. They can also be easily regulated to work well under high or low pressure. They are operated by means of the push button at the top, are practically noiseless in operation and use water economically.

Referring to the illustrations, Fig. 1 shows a sectional view of the valve, with the parts lettered for an explanation of the operation, and Fig. 2 shows the valve connected to a side inlet closet, which is the preferred method of use, although it can as effectively be applied to a top inlet closet.

Turning again to Fig. 1, the method of operations is thus explained: The valve is opened by pushing the pushbutton M. The water contained in valve chamber B escapes through the cap O, and down by-pass H, in the valve casing into the discharge pipe X. The rate of discharge through by-pass H, regulated by the screw G regulates the rapidity of the rise of valve piston A. Upon the rising of piston A to the top of valve chamber B, the pin C closes the valve N, whereupon the upper valve chamber B begins to refill through the opening K, in piston head. The rapidity of the filling of the upper valve chamber B, therefore the rapidity of descent of piston A and the quantity of water discharged at each operation of the valve, is controlled by the disk D. By this regulating disk prac-

The Nethery Hydraulic Flush Valve.—Fig. 1.—Sectional View.

tically any desired quantity of water up to 15 or 20 gallons can be drawn at each operation of the valve. In the descent of piston A the closet flush is obtained while the piston area between piston ring P and piston ring R is passing the supply opening, and the closet seal or refill is accomplished while the piston is passing opening from piston ring R to piston ring T, at which point of its descent the base of piston has reached its seat V and flow ceases. In order to avoid waste of water by the push button being held down, the valve

operates automatically to raise the piston to such a position as to close the supply opening.

The essential working parts of this valve are cast solid, insuring their strength and durability. These valves have been used in a number of important buildings and handled with satisfaction by some prominent

Fig. 2.—Valve Connected to a Side Inlet Closet.

jobbing houses, as shown by the testimonials presented in a handsome catalogue issued by the company.

## Very Ancient Plumbing

The Rev. Dr. A. T. Clay, writing in the September *Woman's Home Companion* on "Digging Up a Bible City," presents some very interesting news relating to discoveries made in the excavation of the city of Nippur, where some finds were made which prove that some of what are commonly looked upon as modern inventions are really of very ancient origin. Dr. Clay was assistant to Professor Hilprecht of the Babylonian Exploration Expedition, sent out by the University of Pennsylvania, to excavate the ancient city of Nippur, in the land where the Garden of Eden was supposed to have been located and in the region where Abraham was born. This expedition succeeded in bringing to light some of the oldest antiquities known. Nippur is the oldest city that has ever been excavated, the foundations having been laid 4000 years before the birth of Abraham. Among the more interesting finds was a drainage pipe made of water jars, which is undoubtedly the oldest example of plumbing known. The bottom of one jar was broken, and into this break the neck of another jar was inserted and plastered with clay, the jars being thus joined one to another after a fashion apparently in common use in Nippur. This prototype of the modern sewer pipe was very crude, but appears to have answered the purpose.

WHEN the question of adaptability for the use of soft coal is brought to the steam fitter, the Gorton & Lidgerwood Company, 96 Liberty street, New York, invite an investigation to their special soft coal Boilers. These Boilers are so constructed that a large quantity of air enters the fire to aid in the consumption of the highly volatile gases which are generated in a soft coal fire. These Boilers are made in a variety of sizes adapted for all characters of work and they have been on the market for several winters, demonstrating their efficiency by satisfactory operation under test.

## ACETYLENE FOR CAR LIGHTING.\*

BY L. T. CANFIELD.

During the last few years a new kind of gas has come into the field as an illuminant—acetylene. Cars equipped with it have burners that consume  $\frac{1}{2}$  cubic foot of gas per hour, and give a light of 25 candle-power, while the Pintsch gas uses a burner that consumes about 2 cubic feet of gas per hour, and gives a light of 25 candle-power. We have several different systems of furnishing acetylene gas for car lighting, some of which generate the gas from a generator applied to each car; others have a generating plant similar to the Pintsch gas plants, where the gas is generated and compressed to as high as 300 pounds per square inch. A method of storing acetylene gas was discovered by two French inventors, who found that one volume of acetone under ordinary temperature and pressure dissolved 25 volumes of acetylene and under 12 atmospheres of pressure would dissolve 300 volumes of acetylene.

In the reservoir for storing this gas the porous bricks, or asbestos, which is sometimes used, is simply for the prevention of explosion. The acetone is for the storing of gas in large quantities in small space, and these two do not enter into the quality or efficiency of the light. The bricks are first made of a mixture of clay and powdered charcoal. The baking of them burns out the charcoal, leaving a porous brick, with which the storage reservoirs are packed. If these bricks were pressed solid, closing up the openings made by the burning out of the charcoal, the solid substance would take up 20 per cent. of the space within the reservoir; 43 per cent. of the reservoir would be filled with acetone, leaving 37 per cent. of the space for expansion. A reservoir 20 inches in diameter by 10 inches long filled as stated above, charged with acetylene gas at 165 pounds per square inch was placed upon a car on the Delaware, Laekawanna & Western Railroad, having four lamps with three burners each and one lamp with one burner. This gas burned a total of 260 consecutive hours and was in service from March 4, 1902, to May 12 of the same year without recharging. The fact of being able to run the car so long without recharging makes this a very desirable light.

Our patrons appear to be quite well pleased with acetylene light. The application of the same is very similar to the application of the Pintsch light and gives less trouble, from the fact that we do not have to fill the reservoirs as frequently. There is one thing, however, that is necessary, and that is to have a successful light, the gas must be kept cool; consequently the pipe leading to the burner, instead of coming down through the center of the lamp, must be brought down on the outside, placing the burner on the end, and above the pipe. I must say that cars equipped with this system are the best lighted we have.

I have had experience with none of the systems that have a generator on each car, and from what I can learn of it I am very much in favor of the system where the gas is generated at a stationary plant, then stored in reservoirs on the cars. There is another system used largely in the Northwest, where the porous brick and acetone is not used, but a large number of reservoirs are used. I am advised that a car with two or three reservoirs has been known to furnish light for cars in a snow blockade for as long as 12 days. To overcome the explosive feature, this system uses fusible seams in tanks and all high pressure pipes under the car are of fusible material, which will fuse at or below 500 degrees F. I have had no experience with this system.

THE BARLOW BROTHERS COMPANY, Waterbury, Conn., are installing the heating plant in the Bunker Hill Schoolhouse in that city and remodeling the ventilating system in the Ridge Street School building. The firm have also been awarded the contract for plumbing and heating a new building to be erected by the Grace Baptist Society.

\* Portion of paper read before the June meeting of the Master Car Builders' Association.

## Apron Pattern Porcelain Enameled Lavatories.

Illustrations are herewith given of new apron pattern porcelain enameled lavatories which have been brought out by the Maryland Foundry Company, A. Weiskittel & Son, proprietors, Baltimore, Md. Fig. 1 is

Apron Pattern Porcelain Enameled Lavatories.—Fig. 1.—Square Lavatory.

a square lavatory and Fig. 2 is a corner pattern. The square lavatory shows the firm's new Roberts waste, which is set with a porcelain index in the handle, making it a handsome waste fitting which can be furnished at a moderate price.

These goods closely resemble solid porcelain ware, but are, of course, much more durable, while the prices are considerably less. Being cast in one piece, they

Fig. 2.—Corner Lavatory.

have no joints to open or to collect dirt, making them of the most substantial and sanitary type of fixtures on the market. Architects are freely specifying them for use in some of the finest houses.

## New York City Notes.

Trade conditions have not materially changed. Work on the large buildings down town is booming and is using all the journeymen who want to work on wrought iron pipe. Harlem is very slow, both in new work and overhauling. The East Side is flourishing and nearly all the plumbers there are busy on tenement work. George Dellon has a tenement at Rivington and Allen streets, at 162 East Fourth street and at 211-213 Henry street. Louis Black is plumbing a tenement at 745 and 747 East Sixth street. E. W. Rod one on Thirteenth street, west

of First avenue. J. Lorde one at 345 and 347 East Third street, also at 353 and 355 on the same street, and S. Greenwald is doing one at 336 and 338 East Fourth street. All these tenements are built under the requirements of the new laws and are up to date, as far as inspection goes.

\*\*\*

Engel & McMahon are installing the plumbing and fire lines in the new Miner's Eighth Avenue Theater. J. F. Barry is to do the plumbing in the apartment hotel at the corner of Amsterdam avenue and Seventieth street; also in a row of apartments on East Broadway, from Eighty-fifth to Eighty-sixth streets.

\*\*\*

Among the down town jobs are lofts at 80 and 82 Crosby street, which are being done by T. J. Byrne; the addition to the National Park Bank, at 153-159 Fulton street, and a loft at Bleecker and Mercer streets, which Byrne & Murphy are working on.

## OUTING OF MANHATTAN BRANCH PLUMBERS.

The outing given by Manhattan Branch of the Association of Master Plumbers of New York City at Crocheton's Hotel, Bayside, was the most successful of the popular outings given by them. Although it was, as usual, a "stag" affair, over 150 plumbers and supply men attended. The breakfast was all that could be desired and most of those attending went out in time for that meal.

Following the collation came a series of games. A hard fought baseball match was won by the plumbers over the supply trade by a score of 28 to 24. The old tried and true badger fight was pulled off as usual, the unprejudiced man selected being Michael H. Feran, a friend of P. F. Kenny, on Broadway. Owing to the "high score" made by Pat Kenny the rifle shooting was interrupted by one of the neighboring residents, who complained that bullets were raining around his house. Some very good scores were made, notably 22 by President A. H. Brown; 20, D. F. Magner, G. W. Heiland, H. E. Mulliken, and 19 by A. W. Reynolds, R. F. Mochrie, T. J. Tuomey, F. C. Loeble, E. J. Smith and W. Lockwood. On the shore C. A. Walsh and J. A. Rossman played craps with scores of 11 and 7 respectively. Sam Glauber was successful in making a clean string of goose eggs.

All the houses in the supply trade were represented either in person or by salesmen. Among the guests present were R. W. Rodman, Capt. W. H. Dewar, R. F. Mochrie and J. C. Starck of the Board of Education, G. G. Stillwell of the Highway Bureau, President D. Donegan, John Bosch, W. M. Brown and Ed. Macdonald of Brooklyn, and General G. D. Scott of the Bronx; also Messrs. Heatherton and Ainsworth of the *Plumbers' Trade Journal*.

Frank Reynolds was late to breakfast, having waited an hour and a half for a Bay Shore train to start, and George Schweppenhauser does not mention being carried to the Battery by a West Side elevated express. The greatest mystery of all is, however, what became of Sam Glauber's coat.

WITHIN the covers of a daintily printed pamphlet which is being distributed by the Boynton Furnace Company of New York and Chicago, the subject of "Twentieth Century Heating" is considered in a way to attract more than passing attention. It is a well known fact that the comfort and health of the occupants of a building depend, all things considered, more intimately upon its heating and ventilating arrangements than upon all purely physical appliances, and starting out with this statement the subject matter gradually leads up to the various systems of heating best adapted for the purpose and to the merits of the Boilers manufactured by the company named. There is also presented a list of some of those who are using Boynton Boilers, this being supplemented by the pres-

entation of a few testimonial letters. The printing is in a delicate shade of green and black and the binding is in deep green paper covers with embossed side title in green and old gold.

## Heating and Plumbing Notes.

THE New York Master Plumbers' Association and the New York Local, No. 2, of the National Union of Plumbers and Gas Fitters have entered into an agreement whereby the journeymen plumbers and gas fitters are to receive \$4.25 a day for eight hours' work, with double time for overtime work. The agreement affects about 4000 plumbers and gas fitters.

THE Supervising Architect, Washington, D. C., will receive sealed proposals until September 8 for furnishing the low pressure Steam Heating Apparatus, &c., complete in place for the Hygienic Laboratory of the Marine Hospital Service, Washington, D. C. Plans and specifications may be obtained from the office of the Supervising Architect.

WILLIAM F. WILSON AND JAMES E. BRETT, representing the Master Plumbers' Association of San José, Cal., appeared recently before the local Board of Public Works to enter a protest against the existing system of estimating the expense of side sewers. The board, after a discussion of the matter, requested the master plumbers to submit some plan of procedure.

JOHN H. RUSSELL, a master plumber, of 335 Central avenue, Albany, N. Y., died on August 19, at his residence in that city, at the age of 37 years, from the effects of a dose of strychnine. Mr. Russell had been troubled with heart disease for some time and used strychnine as a relief. It is supposed that on this occasion he had administered to himself too large a dose of the medicine.

THOMAS B. PIERSON, a well-known plumber of Morristown, N. J., died on August 21 at his home at that place after a long illness. Mr. Pierson was born in Mendham in 1832 and had been engaged in the plumbing business since 1868. He served two terms in the Morristown Town Council and was a member of the Masonic fraternity.

THE Metal Polishers', Rubbers', Platers', Brass Workers' and Brass Molders' International Union, representing between 30,000 and 40,000 workmen in the United States, Canada and Mexico, met in session last week at Bridgeport, Conn., and adopted resolutions providing for an organized movement toward a nine-hour work day without decrease in wages. If this demand is not accorded by the employers before a certain day, which will be decided upon later, it is said that a strike will follow.

A. J. BATES & SON, Webster, Mass., have the contract to install new sanitary and ventilating arrangements in the police station in that town.

WELLINGTON & MILLER, Bridgeport, Conn., have been awarded the contract for steam fitting the factory of the Bradley-Smith Company in New Haven. They are also putting in Coil Water Heaters and overhauling the piping in the Atlantic Hotel at Bridgeport.

D. F. KELLY, New Haven, Conn., has the contract for plumbing the new block to be erected on Congress avenue, that city, for the Fahy Estate.

OTTO EPSTEIN is doing the plumbing in six new houses that are being built by Nevels Brothers on Deerfield avenue, Hartford, Conn.

BROWN & WALES, 69-83 Purchase street, Boston, Mass., are sending to the trade circulars of Yager's Soldering Salts, which are put up dry in small bottles to be mixed by the addition of a little water when needed for use. These Salts are said to be free from disagreeable fumes, to leave the metal bright and clean and cause the solder to flow evenly. They are recommended to lead burners, it being claimed that they prevent the clean lead surface from oxidizing in front of the flame of the blow pipe.

For the purpose of acquainting their friends and patrons with their extensive facilities for the manufacture

of Blowers the American Blower Company, Detroit, Mich., are distributing a tasteful little pamphlet containing views of the various departments of their large manufacturing plant, including the heater erecting, pipe cutting, exhaust fan, wheel, blacksmith, pattern, galvanized iron and paint shops, also their storage warehouses, engine and boiler rooms and drafting rooms, together with a bird's-eye view of the entire plant, which give an imposing impression of their magnitude.

BENNETT & DREYER, Camden, N. J., are installing a steam heating system in the Chestnut Street School-house in that city.

C. B. HODGES of Depew, N. Y., has just completed a fine plumbing job for the Railway Steel Spring Company in that town.

THE BUCKEYE STEAM FITTING COMPANY, Cleveland, Ohio, have the contract for installing a hot water heating system in the new residence of Z. D. Patterson in that city.

DAVID F. ANDERSON has begun an action against the Youngstown Heating Company of Youngstown, Ohio, for the purpose of securing from the company \$13,500 worth of stock, which he claims as compensation for services rendered in the organization of the company.

CUFF & Co., Philadelphia, Pa., have been awarded the contract to install a steam heating plant in the new school building of St. Elizabeth's Roman Catholic Church in that city. The work will cost about \$10,000.

MCCARTHY & REID have secured the contract for the heating apparatus for the new Orphan Asylum at Lawrence, Mass.

JOHN W. BUCKLEY, 69 Warren street, New York, has issued a catalogue and price-list of Rubber Goods for mechanical purposes, including Hose, Belting, Packing, Gaskets, Valves, Tubing, &c.

GIBLIN & Co., Utica, N. Y., have issued a fine 28-page catalogue descriptive of their Standard Sectional Steam and Hot Water Boilers, Standard Vertical Boilers and Standard 20 Series Boilers, together with valuable details showing the manner in which greenhouses can be fitted with their appliances to secure satisfactory results. The heating apparatus described in this catalogue has previously been described at some length in connection with other printed matter issued by this firm.

JAMES B. CLOW & SON of Chicago, Ill., have secured a large contract for furnishing Hydrants to the city of Elyria, Ohio. The Hydrant furnished will be the Eddy, on which the bid made was \$24.75 per Hydrant.

THE HERENDEEN MFG. COMPANY, Geneva, N. Y., have issued a neat 24-page pamphlet entitled "Warmth," which deals with various methods of warming houses, but pays special attention to the line of Steam and Hot Water Boilers manufactured by this company.

JUDSON A. GOODRICH, 107 Beekman street, New York, has been appointed sales agent for the Allen Automatic Air Valve manufactured by the Norwall Mfg. Company of Chicago. This Valve was illustrated in the issue of *The Metal Worker* for August 16.

THE ADAMS & JONES COMPANY, 143 High street, Boston, Mass., have issued a most artistic catalogue comprising 64 pages, which treats of the Ideal Steam and Hot Water Boilers, for which they are sales agents. This catalogue enters very thoroughly into the various types of Boilers, comprising the Ideal line, giving full details of their construction and special features.

W. F. BROOKS, plumber, of 1803 Pennsylvania avenue, Knoxville, Tenn., recently met with a serious accident by falling from the first floor to the ground floor of the new Southern Railway passenger station in that city, a distance of about 15 feet, breaking his left hip and sustaining other injuries which will confine him to his bed for some time to come.

THE master plumbers of Spokane, Wash., have asked the local Journeymen Plumbers' Union to rescind their rule regarding a half holiday on Saturday. The employers take the ground that half a day's work is worse than none, and some of them have intimated that unless the men work all day Saturday they will lay them off Fri-

day night until Monday. Committees from the association and the union are at work trying to reach an understanding on the point.

THE additions that the McNab & Harlin Mfg. Company of New York City are making to their plant at Paterson, N. J., include two large structures, a three-story brick storehouse, 50 x 100 feet, and a new three-story shop, 34 x 100 feet. These buildings will be erected between the company's present shops and their foundry. This addition will materially increase the producing capacity of the concern and also the number of their workmen.

THE ROCKMART SLATE COMPANY of Rockmart, Ga., are building a plant for the manufacture of all kinds of Finished Slate for sanitary purposes, Mantels, Stairs, &c. The company own what are known as the Hood quarries near Rockmart, the product of which is claimed to be of unusually high quality. The new plant will be ready for operation early next month.

CHARLES G. DARRACH of Ridley Park, Pa., has received a contract from the University of Pennsylvania to furnish the ventilating and heating system in the new gymnasium attached to the university, which will be erected at a cost of \$450,000.

THE master plumbers of Pittsburgh, Pa., gave an outing on Saturday last at Chester, W. Va. The plumbers and their friends went to Chester in a special train of ten coaches and enjoyed a delightful day's recreation.

THE contract for plumbing and steam heating St. Vincent's Asylum at Twentieth and Race streets, Philadelphia, has been awarded to William H. Doyle of that city.

WALTER PIPS of Austin, B. M. Childress & Co. of Terrell, and Teagarden & Shumate of Austin, were the successful bidders for the supply of plumbing and steam heating goods to the State institutions of Texas for the ensuing year.

THE STANDARD HEATING & ENGINEERING COMPANY of Lancaster, Pa., have secured the contract to install a vapor system of heating in the Court House at Chambersburg, Pa. Mott's Sun Ray Boilers and Radiators will be used in this work. The same company are installing a steam heating plant in the addition to the hospital at Pottsville, Pa., and will use Sun Ray Boilers and Radiators on this job.

It is reported that the Glauber Brass Mfg. Company, Cleveland, Ohio, have recently purchased a tract of  $3\frac{1}{2}$  acres of land, whereon they purpose erecting one of the most modern and completely equipped Brass Goods manufacturing establishments in the United States.

THE trustees of the Providence Hospital, Sandusky, Ohio, have decided to install an approved modern system of heating and ventilating in that institution.

L. S. ALDRICH, Uxbridge, Mass., is installing a steam heating plant in the Uxbridge Town Hall.

CHARLES F. FLYNN, a plumber of Marlboro, Mass., has been convicted, on the complaint of the Board of Health, of doing plumbing work without having secured a renewal of his plumbers' license, of having failed to apply for a permit to do certain work, and of not having tested the same work, according to law, when it was finished. The defendant was fined \$10 on each charge.

M. W. MANWARING, Bridgeport, Conn., has secured the contract for plumbing the new East Washington Avenue Baptist Church in that city.

J. W. CUFF & Co., Philadelphia, will install a steam heating apparatus, costing \$1490, in the East Columbia Avenue Baptist Church in that city.

FRED. ADEE & Co., 90 Beekman street, New York, are sending out a four-page circular devoted to their Cygnet Water Closet and Zenith Valve. The Closet is shown connected with the Zenith Valve for flushing direct from the service pipe. It is also shown connected with an overhead flush tank, designed to be flushed by means of a lever conveniently attached at one side. This Closet has many special features making it well worthy of investigation by the plumbing trade.

J. J. LAWLER & SON of Norfolk, Va., bid \$1300 and secured the contract for plumbing the new High School Building in that city.

FORREST E. WHITECELL of Bethlehem, Pa., is installing a heating and ventilating system in the Quin School Building of 12 rooms, in South Bethlehem, using the Sun Ray Boilers and Radiators.

THE increasing business of the Whitlock Coil Pipe Company, Hartford, Conn., manufacturers of Feed Water Heaters, Condensers, Coils and Bends, makes it necessary for them to double the capacity of their plant, which has been running more or less night and day for a greater part of the last two years. They are planning an addition, about 86 x 135 feet, to their Pipe bending shop, and later on they expect to erect a two-story addition, about 50 x 75 feet, to the Heater shop.

THE City Council of Summit, N. J., are contemplating making a complete and thorough inspection of the drainage, plumbing and other sanitary equipment of every house in the city, with a view of making Summit a perfectly healthy place. Plumbing Inspector Scott believes that the work can be done in about four months.

THE EXETER MACHINE WORKS of Exeter, N. H., have been awarded the contract to install heating plants in the new Stratham power house and car barn, and in the Pelham and Salem power houses and car barns.

ST. JOHN & BARNES, Colorado Springs, Col., have been awarded the contract for plumbing and heating the new Y. M. C. A. Building in that city, at their bid of \$10,428. The Paul system of vacuum heating will be used.

HOFFMAN, BROWN & WILSON of Circleville, Ohio, have secured the contract for the plumbing in the new \$20,000 stone residence of Senator T. W. Marchant, at Washington, Ohio. The firm also have secured the contracts for steam heating and ventilating the new Presbyterian Church at Greenfield, Ohio, and the new Methodist Church in the same town. The two last named jobs will amount to about \$4600.

W. W. LEWIS, Pittston, Pa., has been awarded the contract for the plumbing and steam heating in the new Broad Street Opera House in that city.

THE School Board of Woburn, Mass., have awarded the contract for heating and ventilating apparatus for the Plympton and Lawrence Street School Houses in that town to the Smith & Anthony Company of Boston.

THE MONITOR STEAM GENERATOR MFG. COMPANY, Philadelphia, Pa., will install a hot water heating plant, to cost about \$900, at 5431 Germantown avenue, in that city.

JNO. C. F. TRASCHER, contractor, Philadelphia, Pa., will install a vapor heating plant, to cost \$2000, in the Centenary Methodist Episcopal Church, Forty-first and Spring Garden streets. A similar apparatus costing \$836 will be installed by Mr. Trascher at 3306 Arch street, and a plant of the same kind to cost \$1300 will be placed in the Women's Southern Hospital, 724 Spruce street—all in the city of Philadelphia.

THE COLWELL LEAD COMPANY baseball team won its third successive victory on Saturday last, the Ronalds & Johnson Company team being the losers by a score of 19 to 8. The Colwell team now claims the championship of the plumbing supply trade, which claim they stand ready to defend. Any team in the trade wishing Saturday afternoon games can arrange the same by addressing W. T. Anketell, manager of the Colwell Lead Company Baseball Team, 63 Centre street, New York.

#### New Firms and Changes.

SHAW & McLAUGHLIN are a new firm in the plumbing and gas fitting business at 205 Park street, Hartford, Conn. Both the members of the firm have had many years of experience in the trade, Mr. Shaw having served with Edward Mahl and Mr. McLaughlin with J. Lyon & Sons for a number of years.

STEELE, ANDRE & Co. of West Hartford, Conn., have been succeeded by W. S. Steele in the plumbing, tin-smithing and sheet metal business.

W. J. PULTE of Grand Rapids, Mich., has purchased the plumbing business of George Soule at Billings, Mich. Mr. Soule was one of the oldest tradesmen in Billings and had been in business there ever since the town was organized. He will remove to a fine ranch, which he bought last winter, a few miles west of Billings.

THE NEWMAN MFG. COMPANY of Elizabeth, N. J., have been incorporated with a capital stock of \$5000 by J. W. Newman, Charles Brown and George W. Orphey, to manufacture Steam Specialties.

C. H. NICKEY has opened a plumbing and tinning establishment in the Schauman Block, Anaheim, Cal.

E. F. ULRICH, for many years connected with the Hasley plumbing shop at Anaconda, Mont., has purchased the business and plant of J. W. Dezell at that place, where he will in future be ready to receive and promptly execute all orders in the plumbing and gas fitting line. The business will be conducted under the title of the Ulrich Plumbing Company. Mr. Dezell is retiring from business.

SAPP HARDWARE COMPANY are successors to A. W. Lee in the Steam Fittings, Hardware and Mill Supply business in Cairo, Ga.

THE plumbing and steam fitting firm of James D. McEntee & Co. of New York City, have been incorporated with a capital stock of \$30,000. The directors are Rennie Stich, Thomas Wall and John Shay, all of New York City.

#### New Publication.

**The Municipal Year Book.** Published by the Engineering News Publishing Company, New York. Pages, 310. Price, \$3.

This publication, which is edited by M. N. Baker, associate editor of the *Engineering News*, is the first issue by the publishers of a work of this character. It is designed for the use of all persons desiring information relative to the various municipalities throughout the United States. It is, of course, particularly interesting to contractors, but will be found of value to many others. It gives the population, assessed valuation, names of principal officials, ownership of public utilities and information regarding water supply, sewerage, street cleaning, street sprinkling, garbage, fire and underground electric service in all incorporated places in the United States and in all New England towns of 3000 population and upward by the census of 1900. It is claimed that never before has so complete an exhibit of the relative extent of municipal and private ownership been presented. This information is first given alphabetically by States, together with the other facts relating to the various cities and towns. It is next presented alone in compact tabular form with the cities arranged in order of population. The book is based on special returns, made with a very few exceptions by the city officials of the several places included. The statement is made that formal reports were secured from all but five or six of the 1524 cities and towns included. This shows the great interest taken in the project.

This volume shows that the town dweller of to-day, even though he lives in a small community, has at his command a wonderful number and variety of public services. Of the 1524 places of 3000 population and upward, by the census of 1900, at least 1475 had water works, 1471 electric lights, 1466 telephones, 1096 sewers for household wastes, 981 gas works and 928 street railway systems. In other words, only some 50, or about 3 per cent. of these 1524 places, are without water works, electric lights and telephones, a little over 400 without sanitary sewers and 500 to 600 without gas works and electric railways.

Eight cities having 20,000 population and over are still without sanitary sewerage systems as follows: Baltimore, Md., 508,957; New Orleans, La., 287,104; Allentown, Pa., 35,416; Topeka, Kan., 33,608; Gloucester, Mass., 26,121; Warwick, R. I., 21,316; Columbia, S. C., 21,108; Shenandoah, Pa., 20,321.

The constant increase in the number of water purification plants in the United States is one of several indications that municipal health problems are at last beginning to receive something like adequate attention in the more progressive communities of the country. The returns show 243 cities which can be classified under some one of the various methods in vogue for improving the quality of public water supplies. In addition 68 places merely reported that their water was filtered.

## PATTERNS FOR FLOUR SIFTER.

(Without allowance for laps.)

In Fig. 1 is shown a finished view of a flour sifter, usually made from 10 bright tin plate. The handle A, which is fastened to the body, is further strengthened

THE METAL WORKER

Patterns for Flour Sifter.—Fig. 1.—Perspective View of Flour Sifter.

by the conical boss B. C shows the wire handle which operates the beaters when the flour is to be sifted through the wire cloth sack on the inside of the body, which will be explained as we proceed. Knowing the size of the sifter, first draw the elevation of the body

Fig. 2.—Plan, Elevation and Pattern for Body.

of the sifter, as shown by A B C D in Fig. 2. Directly below it, in its proper position, draw the plan, as shown by E F G H. Midway between B and C in the elevation draw the handle I J, shown in plan by K L. Now draw M N in elevation, which represents the wire handle, made from  $\frac{1}{8}$ -inch thick wire, which passes through the button on the end of the handle and through the two sides of the body, as shown. The wire handle is shown in plan by O E, and is fastened in position by the washers at a and b. A small knob fastened to the end of the wire handle is shown at f, while P shows the button double seamed to the tin handle at c, and R S the conical boss between the handle and the body.

As both halves of the body are symmetrical, then divide the half plan E F G into an equal number of spaces, as shown by the small figures 1 to 7, from which erect vertical lines intersecting the top and bottom of the body in elevation, as shown. In line with C D draw the line D T, upon which place twice the number of spaces contained in the half plan, as shown by similar figures on D T. At right angles to D T and from these small figures draw lines, which intersect with lines drawn from similar numbers on A B at right angles to A D. Trace a line through the points thus obtained. Then will U V D T be the pattern for the body of the sifter. It will be noticed that the pattern is obtained below and above the wire lines on top and bottom of the body respectively, and for that reason allowance must be made to the net pattern shown. The small dots X, W, Y represent small holes to be punched into

the pattern to admit the wire handle N M, and are obtained by projecting a line from M, intersecting the center and ends of the pattern as shown.

While the pattern for the handle K L in plan or I J in elevation presents a problem of two cylinders of unequal diameters intersecting each other at a right angle, we will assume that 7 G in plan is a plane surface and make the pattern in length equal to K 7 and in width equal to the circumference of the circle r, to which laps must be allowed for soldering. This pattern will answer for all practical purposes where the body is of large and the hand of so small a diameter.

The pattern for the button P is shown at Z, d representing the hole punched to admit the wire handle, and e the edge to the double seam on the handle K L at c. For the pattern for the conical boss, R S, joining the round body of the sifter, proceed as is shown in Fig. 3, which is an enlarged view to clearly show each step taken. First draw the center line A A', and from A as center draw a portion of the body, as shown by B C. Then draw a portion of the handle E F G H and establish at pleasure the pitch at the boss I J and I' J'. Extend these lines, intersecting the center line A A' at L. Draw a line from I to I', intersecting the center

line at a. Then, using a as center and a I as radius, describe the half section of the boss on the line I I', as shown by 1 3 1. Divide this half section into equal spaces, as shown by the small figures 1, 2, 3, 2, 1, from which points, at right angles to 1 1, draw lines inter-

THE METAL WORKER

Fig. 3.—Enlarged View of Boss.

secting the base lines 1 1, as shown. From these points draw lines to the apex L, intersecting the body of the sifter B C at 1, 2', 3', 2', 1. From these intersections, at right angles to the center line A A', draw lines intersecting the side of the boss at 1 2'' 3''. Now, with radius equal to L I, and L in Fig. 4 as center, describe

the arc  $1\ 1''$ , upon which place the stretchout of twice the number of spaces contained in the half section  $1\ 3\ 1$  in Fig. 3, as shown, by similar number on  $1\ 1''$  in Fig. 4. From these points draw radial lines to the center  $L$ , as shown. Now, with radii equal to  $L\ 2''$  and  $L\ 3''$  in Fig. 3, and with  $L$  in Fig. 4 as center, draw arcs intersecting radial lines having similar numbers, as shown by the intersections  $2^\circ, 3^\circ, 2^\circ, 2^\circ, 3^\circ, 2^\circ$ . In a similar manner, with radius equal to  $L\ J'$  in Fig. 3 and  $L$  in Fig. 4 as center, draw the arc  $J\ J'$ , intersecting the ra-

Fig. 4.—Pattern for Conical Boss.

dial lines drawn from  $1$  and  $1''$ . Trace a line through the points thus obtained; then will  $1\ 1'\ 1''\ J'\ J$  be the pattern for the conical boss.

In Fig. 5 is shown the construction of the beater and wire cloth sack.  $A\ B\ C\ D$  represents the sectional view of the body with a bead turned out at  $D$  and  $E$ . The bead  $E$  should be placed at a distance from the bottom equal to the half diameter of the body. A circle of fine wire cloth is now cut equal in diameter to the stretchout of the half circle  $b\ F\ a$ , and then formed into the shape of a half sphere with an edge turned out slightly at the top, as shown at  $a$  and  $b$ , and tacked with solder around the bead  $E$ . Two strips of tin are now edged or beaded, as shown at  $M$  or  $L$  respectively (which is full size) and equal in length to the circumference of the circle  $d\ e$  (which is slightly smaller

Fig. 5.—End and Sectional Views.

than the half sphere  $F$ , to allow it to turn easily), and rolled up and soldered. Then the two rings are joined together at right angles to each other, as shown in the end view of beater at  $h\ f$  and  $i\ j$ . A hole is punched through the center, as shown at  $s$ , to admit the wire handle. The ring beaters are now placed in the body, as shown by  $d\ e$ , and the handle  $c$  passed through the tin handle, body and rings. Then the rings are soldered firmly to the tinned wire and the washers soldered to the handle on the outside, when the beater is ready for use. If the sifter is of large size, three or four rings can be used for the beater.

THE LAUGHLIN NAIL COMPANY, Martin's Ferry, Ohio, are installing new engines to run their eight Tin mills.

## NEW YORK SHEET METAL WORKERS' WAGES.

The threatened labor troubles in the metal roofing and sheet metal working industry in New York City and vicinity appear likely to be averted. According to present indications, the demands of the Cornice, Skylight and Sheet Metal Workers' Union for a wage of \$4 a day of eight hours, after September 1, with a half holiday on Saturday all the year round, without pay, will probably be granted by the Employers' Association. Some of the employers who are not members of the association have already signed the agreement. The union requires all employees on cornice, skylight and sheet metal work to become members of their organization, with the exception of one foreman in each shop, who is allowed to be a nonunion man. The only obstacle at present in the way of a general settlement is a difference between the Cornice, Skylight and Sheet Metal Workers' Union and the Tin and Metal Roofers' Union—two separate organizations—as to which body are to apply corrugated iron siding above and below the eave lines of the roof. The cornice makers claim that the work belongs to them, while the roofers contend that it is a covering job, whether on the top or side of a building. It is regarded as probable, however, that the two unions will settle this matter between themselves, or that they will agree to leave it to the discretion of the employers to decide to whom they prefer to give this work. The sum of \$4 a day is good wages, for which employers are entitled to the services of good workmen. The advance in wages will naturally create a tendency on the part of employers to weed out the middle or poorer class of workman, and obtain in his place a first-class mechanic. As the union makes no distinction in pay between a good and a bad workman, the result in the future will be that the inferior mechanic will be the loser in the number of day's wages earned a year, while the first-class mechanic will have steady employment with everything to gain.

## Death of Charles H. Curtis

The trade will regret to learn of the death of Charles H. Curtis, vice-president of the J. M. & L. A. Osborn Company, Cleveland, Ohio, and a prominent business man of that city. Mr. Curtis' death occurred on August 25, at his residence, 58 Fourth avenue, Cleveland, as the result of an attack of smallpox of the most virulent type, which carried him off after three days' illness. Mr. Curtis was 40 years of age, and was formerly a resident of Niles, Ohio, where he did business for many years under the style of the Curtis Roofing Company. Subsequently he was connected with the Curtis Sheet Steel & Corrugating Company of Zanesville, Ohio, and removed to Cleveland about four months ago to assume the position of vice-president of the J. M. & L. A. Osborn Company. Mr. Curtis was highly esteemed by a large circle of friends, both in and out of business, and was regarded as a broad minded, upright business man of excellent judgment and capacity. He was a member of the Epworth Memorial Methodist Church of Cleveland. Mr. Curtis leaves a widow, two sons and one daughter.

## The E. W. Bliss Company.

The E. W. Bliss Company and the United States Projectile Company, both of Brooklyn, N. Y., have been consolidated, and will in the future be controlled by the same officers. Heretofore the two companies, while distinct and independent, have been owned by practically the same men. The Bliss Company are the largest manufacturers in the world of presses, dies and special machinery for working metal. They also make the Whitehead submarine torpedo for the United States Government. The Projectile Company manufacture the well-known "Projectile" brand of pressed steel gears and pinions, together with their regular line of projectiles. During the past year they have been compelled to double the capacity of their works and are even now contemplating important additions in order to enable them to keep up with the increasing demand for their

products. Hereafter this plant will be known as the E. W. Bliss Company, Projectile Department. The Bliss Company are capitalized at \$2,000,000, \$1,000,000 of which is common and \$1,000,000 preferred stock. The Projectile Company are capitalized at \$500,000, all common stock.

### A COMBINATION DIE.

While the boilermaker frequently flanges a pair of heads by hand and the tinner occasionally makes a few ends in a hand burring machine, says John D. Riggs in *Ryerson's Monthly*, the sheet metal manufacturer who

A Combination Die.—Fig. 1.—Round Blank and End Made from Blank.

makes articles in large quantities finds that such work can be done cheaper and better in dies.

In turning a flange around a head or an end the material is forced from a larger to a smaller diameter and this surplus stock must be worked in somewhere, either in making the flange thicker or in making it deeper. In making ends in dies it is common to keep the thickness nearly uniform and to draw the surplus stock to the edge, thus making the flange deeper than the width of the ring from which it is made.

In making dies it is often necessary to know how deep a flange will draw from a certain blank. In Fig. 1 the upper part represents a round blank and the lower part an end made from this blank. If we represent the diameter of the blank by  $a$  and the inside diameter of the end by  $c$ , then  $b$  will be half the difference between  $a$  and  $c$ , while  $x$  will represent the increase in the depth of the end. To find  $x$  we may solve the proportion:

$$c : b :: b : x$$

Or when we have a drawing we may use the following rule: Take  $b$  in the compasses and step off  $c$ , then divide  $b$  into the same number of steps and one of these whole steps will be  $x$ . Add  $x$  around the edge and we have the depth of the finished piece.

In Fig. 1  $b$  is contained in  $c$  about four and three-quarter times, so  $x$  is contained in  $b$  four and three-quarter times. This rule assumes that the thickness of the flange will be the same as that of the blank, but when it is from 2 to 5 per cent. thinner it will be proportionately deeper.

A die for the combined operations of cutting and forming ends 1 foot in diameter or less may be made as shown in Fig. 2. The four dimensions  $n$ ,  $h$ ,  $d$  and  $b$  will be determined by the press that the die is to be used in and by the end that is to be made, but some of the other details may be varied somewhat to suit the conditions.

The punch or upper part is often made by welding a tool steel ring onto a wrought iron or machine steel body. In small work the entire punch may be made of tool steel, or when the cutting edge of the punch does not require to be hardened the steel ring may be brazed on and a higher quality of tool steel used than when welding is resorted to. The central plate riveted onto a stem fits loosely and pushes the finished piece out of the punch, either by the end of the stem striking a stationary "knockout" in the press or by means of three or four coil springs set into pockets drilled for them, as shown.

The die proper is sometimes made by welding a tool steel ring onto a large wrought iron plate, but is more often made by carefully fitting a hardened and ground

steel ring onto a cast iron plate or base, and fastening it with screws. These screws may pass directly through the hardened steel ring, or, better, through an outside cast iron ring, as shown. The cast iron center of the die may have a hardened steel ring, as shown, when it is necessary to make a large number of ends to a standard size, or a steel face when letters or ornaments are made on the work. The drawing ring is held up by means of a rubber (or steel) spring through four or more pins, as shown, and clamps the blank against the face of the punch after it is cut out and until the forming is completed. As the punch returns on the up stroke, this drawing ring strips the work upward and off from the die center.

The rubber spring should be quite long, so that the tension on the work will be nearly uniform during the drawing operation. For flanges  $\frac{1}{4}$  inch deep a spring 5 inches long will answer, but for a flange 1 inch deep a spring 1 foot long or more will be necessary. The nut on the lower end of the stud bolt serves to adjust the tension of the spring.

Two gauges are commonly used, similar to the one shown, but not often on the right hand side; one on the back and one on the left side is a more common arrangement. A stripper of some sort is often used to pull the scrap off from the punch, but this may be dispensed with when working thin stock with the gauges set in close to the punch.

Small work can be made quite rapidly in a press with a die of this class, and a large order is often completed in a very few days. A day's work often runs to over 10,000 pieces, and, in some exceptional cases, to more than double this number.

Dies similar to the one illustrated are often made

Fig. 2.—A Combination Die for Cutting and Forming.

for work which is not round, such as meat can ends with straight sides and a small round corner, and in stove work, with straight sides and round ends.

### Tectorium.

Tectorium, a new building material of German invention, is described by a contemporary as consisting of a galvanized wire web, which is covered with a peculiarly prepared mass, the ingredients of which are a secret of the inventor. This article, while it allows the light to penetrate, breaks the rays of the sun and in this way prevents an uninterrupted view into the place. Tectorium is tough and yet pliant, can be bent in any desired shape and is insoluble in water.

On account of its light weight it is well adapted to light roofing purposes, and is also weather proof. A whole roof covered with Tectorium presents a very handsome appearance. It can easily be cut with shears and be nailed on strips of wood, window casings, &c. It can also be repaired without trouble, in case a hole is

punched through it by accident. It is cheaper than glass, as it is unbreakable, and can be used with great success for factory windows, skylight, hothouse lights, verandas, transoms, &c., and is manufactured by Gustav Tickhardt, Bonn, Germany.

### The Late John Henry

The death of John Henry, the former head of the Chartiers Iron & Steel Company of Carnegie, Pa., which was briefly referred to in our last issue, removes a prominent figure from the iron and steel manufacturing industry of the Pittsburgh district. Mr. Henry died on August 16 at the Mercy Hospital, Pittsburgh, as the result of injuries sustained by being run down by a train on the Pan Handle Railroad on the previous night. He was born at Port Talbot, South Wales, 60 years ago, and came to this country in 1866, settling in Pittsburgh. He found employment as roller in some of the Pittsburgh iron mills, subsequently going to Apollo, where he remained for nine years in the sheet iron works, thoroughly acquainting himself with the industry. In 1877, he returned to Pittsburgh and for a time was a roller in the Moorehead, McCleane & Co.'s mills in Soho. From that place he went to Ironton, Ohio; Cincinnati and Cleveland, returning to Pittsburgh in 1884, when he organized the Chartiers Iron & Steel Company, with works at Carnegie, Pa. For 18 years he remained at the head of that concern and established a high reputation as a manufacturer of high grade sheet steel. In 1900 the Chartiers plant was absorbed by the American Sheet Steel Company, and Mr. Henry retired from its management. Since that time, however, he had acted in an advisory capacity for the American Sheet Steel Company. Mr. Henry was married in 1882 to Miss Jennie Petticord of Cambridge, Ohio, and leaves four children. He made his home in the suburb of Glendale.

### A Large Copper Contract.

J. H. Jolley & Co., 42 North Fifth street, Philadelphia, Pa., advise us that they have just completed delivery to the League Island Navy Yard, Philadelphia, of all the sheet copper and composition sheathing nails necessary for sheathing the United States cruiser "Denver," the first of the Government steel vessels to be sheathed with copper. The work required 1462 sheets of 30-ounce, 1972 sheets of 28-ounce, and 1525 sheets of 26-ounce soft sheet copper, 14 x 48 inches in size, the whole having a weight of 40,438½ pounds. There were also supplied 60 pounds of composition cut nails, 1½ inches long, and 4800 pounds of nails, 1¼ inches long, having a total weight of 4860 pounds. The contract was awarded to the firm on August 8 and delivery of the material was completed on August 20. In addition to the "Denver," the steel cruisers "Chattanooga," "Galveston" and "Cleveland" are to be copper sheathed as soon as ready. J. H. Jolley & Co. are agents for the Taunton-New Bedford Copper Company, and also for the Randolph & Clowes Company, manufacturers of seamless brass copper tubes.

### The Vulcan Detinning Company.

In response to requests for information as to their affairs, the Vulcan Detinning Company of New Jersey with reduction plants at Sewaren, N. J., and Streator, Ill., have sent the following circular to their stockholders:

The products of our mills are "merchantable pig tin" and "steel scrap" (used by steel mills), which we convert from tin plate waste produced by tinware and can manufacturers. There is a ready market for both products at all times. Our output is contracted ahead for the balance of this year and partly into next year.

The result of our business from April 1 to July 1, 1902, the first quarter under the new consolidation, is as follows: Earnings after payment, of operating expenses, \$76,954; less for betterments and maintenance, \$7653; net earnings, \$69,271; dividends paid, 1¼ per cent. for three months, \$1,500,000 preferred stock, \$26,250; dividend paid, 1 per cent. for three months, \$2,000,000 common stock, \$20,000; total, \$46,250; carried forward to reserve fund, \$23,021. Before consolidation the net

earnings of the two companies which comprise the present company for the same period in 1901 were \$41,258.

By these figures you will observe that the results shown after consolidation are very gratifying, and judging from present conditions of trade, there is every prospect of a continuance of improvement. The stocks, both common and preferred, are at present dealt in on the "curb," and in due time it is the intention of the company to make application to have them listed on the New York Stock Exchange.

### FLASHINGS.

THE Elwood, Ind., plant of the American Tin Plate Company, which has 26 mills, was closed down indefinitely last week, also the company's six-mill Humbert plant at South Connellsville, Pa. It is claimed that less than 20 of the union mills of the company, out of a total of about 200, are now in operation. Seventy-four non-union mills controlled by the company are reported to be running full. About 2000 employees are thrown out of work by the closing down of the Elwood plant.

JOHN BYRD of Philadelphia, Pa., has taken contracts for the copper work on the front of the building at 1510 Chestnut street; for the slate and metal work on the new signal tower for the Pennsylvania Railroad at Thirty-third street and Pennsylvania avenue, that city, and for 10,000 square feet of tile and copper roofing, with ventilators, for the new United States Post Office now in process of erection at New Brunswick, N. J.

THE NEW JERSEY GALVANIZING & TINNING WORKS of Newark, N. J., recently incorporated, are erecting a modern plant for the manufacture of Galvanized and Tinned Sheets.

Two new sets of cold rolls are being installed in the Midland plant of the American Sheet Steel Company at Muncie, Ind. The entire plant has recently been remodeled and put in first-class condition at a cost of about \$25,000.

THE WALTER J. SCULLY VENTILATOR COMPANY of Detroit, Mich., have been incorporated with a paid in capital stock of \$150,000, by Walter J. Scully and James N. Teahan of Detroit and William Delano of Grand Rapids.

THE first press message to the outside world by wire from Valdes, Alaska, received a few days ago over the recently completed telegraph line, reports that Robert Blei, an expert, sent into the Nazine silver district, has just reached Valdes and reports that the Nazine district has the richest mines in Alaska. Mr. Blei reports the discovery of immense deposits of Tin near Mount Wrangel, 150 miles distant from there. Should this report be substantiated it is likely that a railroad will be built to the district at the earliest possible opportunity.

J. R. DAVIES, manager of the Cwmfelin Steel & Tin Plate Company, Limited, of Swansea, Wales, is at present in the mining district about Birmingham, Ala., and it is reported that he may establish a plant in that district. Mr. Davies is visiting the different steel and rolling mills and investigating their products.

THE AMERICAN SHEET STEEL COMPANY have bought a large tract of land adjoining the W. Dewees Wood plant, at McKeesport, Pa., upon which they purpose to erect a large addition to the plant.

Two pots in the galvanizing department of the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, were placed in operation last week. The entire plant is expected to be in full running order within a short time.

THE DAVID LUPTON'S SONS COMPANY of Philadelphia, who recently succeeded the old firm of David Lupton's Sons, are enlarging their manufacturing plant, which already covers 4 acres.

LENTZ & OPEL of Sherman, Texas, manufacturers of Architectural Sheet Metal Work, Roofing, Guttering, Tanks, &c., are reported to be doing a large business in their line. They bought the tin shop of the Roberts, Sanford & Taylor Company last May, and have materially increased the business since. The firm make all kinds of Metal Tanks for water and oil. Both of the proprietors are practical workmen of long experience.

THE plant of the Ashland Sheet Steel Company, Ash-

land, Ky., at which a strike was declared some time ago owing to the refusal of the company to sign the Amalgamated Association wage scale, although offering to pay the scale wages, has been declared off, and the mill has resumed operations in full.

F. H. SNEATH, Hartford, Conn., has contracts for the slate roofing in connection with the additions to the factory of the Pratt & Cady Company, and the Capewell Horse Nail Company in that city. He is also doing the slating on the chapel at Cedar Hill Cemetery and on Christ Church, both in Hartford, as well as on St. Mary's Church and a building for Landers, Frary & Clark, in New Britain.

THE AMERICAN ROLLING MILL CORPORATION, with mills at Muncie, Ind., Muskegon, Mich., and Sandwich, Ill., have purchased the Continental Chain Company, whose works are located at East Chicago.

THE organization of the Empire Iron & Steel Company, who are building a Sheet plant at Niles, Ohio, has been completed by the election of the following officers: Wade A. Taylor, president and treasurer; Charles S. Thomas, vice-president and manager, and Jno. F. Odea, secretary.

E. I. LEIGHTON, formerly with the Cleveland Punch & Shear Works, Cleveland, Ohio, has been elected general manager of the Cleveland Machine & Mfg. Company, and will manage the affairs of the company.

THE BROOKLYN METAL CEILING COMPANY, 283-287 Greene avenue, Brooklyn, N. Y., advise us that they have recently completed some unusually large contracts for Metal Cellings and Side Walls. Among their biggest jobs are the interior covering of A. D. Matthews & Sons' addition on Smith street, Brooklyn, as well as 100,000 square feet of Metal Ceiling in the company's original store; also the large dry goods store of John Daniel & Son, at 763 Broadway, the Methodist Episcopal Church at Dekalb and Bushwick avenues and the Building Commissioners' office in the Borough Hall, Brooklyn; also the walls and ceilings of the entire building recently put up by J. Kuntz & Sons, at Smith and Wyckoff streets, Brooklyn.

GEORGE CALLAHAN & Co., 218 Front street, New York, have just received another order from the Government for their Elastic Water Proof Rubber Roof Cement. This tends to prove the truth of the company's contention that wherever their Cement has been tried it has been followed by a second order. The concern have established an enviable reputation on both their Rubber Roof Cement and Steam Joint Cement in the 15 years during which they have been making these goods. They will be pleased to send free samples to any one desiring them.

### TRADE NOTES.

THE WHALEY-TOTTEN COMPANY, 940 Ellicott square, Buffalo, N. Y., advise us that they have submitted their Totten Compound for soldering Aluminum to the Pittsburgh Reduction Company for experiment and test. They have been advised by that company that the Compound has been submitted to various tests, with the result that it has demonstrated its superiority over any materials they have yet tested, possessing qualities which give it a decided advantage over any Aluminum Solder so far submitted. The Pittsburgh Reduction Company will make further experiments with the Compound, which the manufacturers are satisfied will increasingly demonstrate its value as a medium for soldering Aluminum. The manufacturers state that they are meeting most flattering success in the marketing of Totten Compound, and that the cases where a trial of the Compound does not result in sales are very rare.

THE G. W. BOND COMPANY, manufacturers of Brass, Composition and Aluminum Castings and Wares, have purchased a site at Waltham, Mass., and will begin the erection of a large factory.

THE WOLVERINE BRASS COMPANY, Grand Rapids, Mich., are erecting a new Brass foundry.

THE annual report of the National Enameling & Stamping Company of New York, presented last week, showed that after deducting everything in the nature of operating expenses there was left a profit of \$2,566,817.

From this was deducted the salaries of the officers, directors, &c., amounting to \$106,908, interest amounting to \$13,515 and a depreciation footing up \$457,875, leaving a net profit of \$1,988,428. Deducting from this sum \$107,593 interest, \$1,780,835 was left available for dividends.

IRVING W. FOX, Rochester, Minn., manufacturer of the Rochester and Clipper Wood Saws and Tornado Tank Pumps, is erecting a new shop, which will be double the size of his former building.

OHIO WRINGER & LAWN MOWER COMPANY, Springfield, Ohio, have been succeeded by the Ohio Wringer Company, who have just been incorporated with a capital stock of \$15,000. The officers of the new company are George D. Leedle, president; M. R. Harris, vice-president and treasurer, and C. C. Leedle, secretary. George D. Leedle will be superintendent and general manager of the concern, and Mr. Harris will have charge of sales. The company will discontinue the manufacture of Lawn Mowers and will hereafter devote themselves entirely to making Wringers.

HIGH Grade Porcelain Enameling is the specialty of the John Peil Enameling Works, Columbus, Ohio. The concern are prepared to do all kinds of enameling in every variety of color. Their Enamel is described as very hard and tough, and well adapted for application to stamped steel kitchen sinks, steel refrigerator linings, lamp shades and tops, and also for gas and other stoves.

### Successful Scheme of Ventilation at Sheffield, England.

The following description of a method of cleaning soot laden air, taken from the *Ironmonger* of London, will be of interest to many in New York City if the coal strike continues or if, after it is over, some energy is not expended by the authorities to induce a return to anthracite coal:

The Sheffield Engineers, Limited, of Wellington Works, Sheffield, have just completed an elaborate arrangement of ventilation for the National Telephone Company in Sheffield. The many works surrounding the telephone exchange discharge so much smoke and soot into the atmosphere that it has been found impossible to open the windows of the building even on the hottest day, and consequently the ladies employed in the switch room suffer considerable discomfort and some injury to health. When the heat was excessive the frequent cases of fainting seriously disturbed the working of the exchange. To meet the special difficulties attending the ventilation of the building a number of firms were invited to submit proposals, and that of the Sheffield Engineers, Limited, being adopted, the work has been carried out by them to the satisfaction of all concerned. The air is drawn into the room through a coke screen, which clears it of soot and dirt. The screen is kept moist and it is possible to regulate to a certain extent the amount of moisture entering the room. After it has passed through the screen, and before entering the room, the air can be taken to an arrangement of radiators to enable the temperature to be regulated as desired. The air then passes along a long air shaft running along one end of the room and thence into the apartment through a series of small gratings fixed at intervals along this shaft, which is so shaped that the velocity of the air is practically the same at all the outlets, no draft being perceptible in any part of the room. The windows will be kept closed, and the only outlet being at the opposite end of the room the air introduced must travel through every part of it before escaping.

Consul-General J. P. Bray reports that an International Exposition of Arts, Sciences and Industries will be held in Melbourne, Australia, during November and December, 1902, and January, 1903. It will be conducted by private enterprise. All communications as to space, &c., should be addressed to John A. Joubert, secretary of the Australian Federal International Exposition, 229 Collins street, Melbourne, Victoria.

## THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

### FUEL OIL BURNERS.

From F. E. H., Dover, N. H.—I notice in *The Metal Worker* of August 23 that you desire information in regard to fuel oil burners for use in kitchen stoves, &c. I have had a little experience with such burners and am glad to give your readers the benefit of the same. In the first place there is no burner now on the market, to my knowledge, that is practical. There are two styles, for which the manufacturers make great claims; but these claims are not found to hold good on a fair trial. The main objections are: 1, exorbitant price; 2, the stove is soon filled up with heavy soot, notwithstanding the makers' claim of "no dirt;" 3, the burner burns out after a few months' use; 4, they consume fully three times the amount of oil that the makers estimate; 5, the fire is apt to "puff" and not burn steadily, without any apparent cause; 6, the fire cannot be regulated; you must either have a full fire or none at all. In my opinion, the oil burners would be far more practical if they were made in one piece, like a water front, and had an inlet at the top, instead of taking the air up through the fire.

The above applies to the style of burner which is placed in the fire box of a stove. The other style, which is set in place of the range covers, is a "fake." That is, it is sold on a fake plan. Two or three men will rent a vacant store, place a carefully constructed burner in operation and advertise the fact, inviting the public to see the wonderful invention. In the meantime they are on the lookout for some one to take the agency for several counties. The prospective agent must buy several hundred burners to begin with and pay cash for them. This accomplished, the promoters jump into another State. In the meantime the burners arrive and are found to be very poorly constructed and fail to work properly. The agent must then nurse his wrath and his pocketbook.

### QUESTIONS FOR PLUMBERS.

From F. C., New York.—Having read the letter of "D. & E." of Jackson, Miss., in *The Metal Worker* of August 23, I venture to give the following opinion in reference to their question. In New York City the trap and vent cover as shown would not be allowed, as it would conflict with the plumbing regulations. This, however, by no means condemns the trap. Drum traps with the clean out covers at the top are quite generally used throughout the country. In my opinion not enough of the rankest form of sewer gas could escape through the screw joint of either cover or the coupling to undermine the most delicate constitution. This is a feature that would be considered a weak point in the trap construction. From the fact that drum traps are so generally used it is more than probable that the new form will be accepted by many of the plumbers as an improvement, for if it does not leak water there will be very little chance for the gas or foul air to get through the screw joints, particularly when the trap is ventilated.

### BOILER TOO LOW.

From J. E., Brooklyn, N. Y.—In regard to the letter of "B. K. M." in *The Metal Worker* of August 2, referring to noise in boiler, I would say that I have had this same experience more than once. If the circulating pipe has been enlarged and there is no low point, and if all the connections are properly made, there is only one possible fault and that is too much water back and too large a fire space. Shield the water back and it will prove a remedy. Take a piece of  $\frac{7}{8}$ -inch wood and make a pattern and have a plate cast the size of the water back. If the casting is made the same height as the water back and to cover three sides of the fire

chamber so that it can be dropped in and readily held in place, it will simplify matters. In my opinion the location of the boiler has nothing whatever to do with the trouble. Now the whole trouble which "B. K. M." has, and which he will find out, is that his water back was generating steam and its condensation in the boiler caused the noise.

### WILL FURNACEMEN HELP?

From A. S., Alden, Iowa.—I have a furnace to install in a two-story brick building which is to heat two stores under the same roof, as shown by the sketch herewith. The corner store, which has a Southeastern exposure on its longest side, is 100 feet long and 22 feet wide, and has a 12-foot ceiling. The Northeastern end, which is the front, has a glass exposure of 220 square feet, and along the Southeastern side there is a glass exposure of 158 square feet. Beside this store is a drug

*Will Furnacemen Help?*

store, 22 feet wide and 60 feet deep, having 220 square feet of glass at the front and 225 square feet of glass in the rear, opening into a room that is not to be heated. The basement is 6 feet 6 inches deep, and is divided by a stone wall, and the furnace is to be placed under the large store as close as possible to the stone dividing wall. Now the questions on which I should like to have assistance are: What size of furnace should I use? Is it best to use two hot air pipes, one for each store, or would it be better to use more? What size of pipes and registers should I use, as the owner wishes to take cold air from the stores, to use a rotary system and to take the cold air from three different places. No cold air will be taken from the outside. The exposure is very light, as there is another brick building adjoining on the drug store side. There is a furnace in the building, but it has not given satisfaction, never heating the drug store sufficiently. This, I think, is due to the location of the registers and the small size of the cold air duct. The hot air registers are now placed in the center of the floor and the cold air registers between the hot air registers and the furnace, just back of the counter. The second floor has exactly the same plan as the first floor, but it is not to be heated.

### PATTERNS FOR A CHIMNEY TOP.

From J. B., Norwood, Mass.—In *The Metal Worker* of August 2 "J. L." of New Brighton, S. I., asks for the lay out of a chimney top, which information, I note, you have given to him. I also note in *The Metal Worker* of August 16 that Henry Weyand of Waterbury, Conn., claims that if this chimney top as you have laid it out in your illustration is manufactured, it will be an infringement on his patent ventilator. This may be so, as I admit I am not fully conversant with the patent laws. It seems a little odd, however, as I made this same style of chimney top more than 30 years ago, and since, for parties I have worked for, up to within a few years. This style of chimney top is often used on the coast and in this vicinity. I am a practical plumber, tin and sheet iron worker. I began to learn the trade on March 1, 1862, and have been engaged in it continually since. Can you explain for the benefit of your readers wherein the infringement lies? I, for one, should like to know.

### WHO MAKES THE MILLER PATENT CONDUCTOR PIPE?

From A. H., Fulton, Ky.—Will you kindly inform me where and by whom the conductor pipe known as the Miller patent is made?

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** is very dull, and prices have declined about  $\frac{1}{2}$ c. a lb.

**Copper** continues weak and dull.

**Pig Lead** is firm and quiet.

**Spelter** is firm, with continued scarcity of spot.

**Antimony** is quiet and unchanged.

**Nickel** is in fair demand at unchanged prices.

**Aluminum** continues in good demand, with prices unchanged.

**Tin Plates** are very dull and without quotable change in price.

**Sheets** are in fair demand, with weak tendency to prices.

**Scrap Iron** is strong and in active demand.

**Scrap Brass and Copper** are weak and dull.

**Scrap Zinc and Lead** are firm and in good demand.

**Foundry Iron** is scarce to the point of famine for spot and prices are nominal.

**Sheet Copper** is in fair demand and firm in price.

**Sheet Zinc** is moderately active and very firm.

**Hardware** is active for the season, with prices strong in almost all lines.

**Plumbers' Supplies** are active and prices rule firm.

**Solder** is slightly lower in price in sympathy with Tin.

**Cast Iron Pipe and Fittings** are active and strong.

**Plumbers' Brass Goods** are in fair demand and prices rule firm.

**Wire Nails** are in fair demand, with prices well maintained.

**Cut Nails** are unchanged.

**Galvanized Pails** have been advanced 4c. a gross.

**Coffee Mills** have been marked up in price by some makers.

**Linseed Oil** is in fair demand; prices are unchanged.

**Spirits Turpentine** is more active and  $\frac{1}{4}$ c. a gallon higher in price.

## METAL MARKET.

NEW YORK, August 29, 1902.

**Pig Tin.**—Weakness has been the predominant feature of the Tin market throughout the week under review, and prices have dropped quite sharply under the influence of freer offerings and a comparative absence of consumptive demand. At the close the tone of the market was very weak, both here and in London, especially for spot Tin. Jobbers quote Straits Pig in small lots at 28 $\frac{1}{2}$ c. to 28 $\frac{3}{4}$ c. per lb. Arrivals so far this month have amounted to 3240 tons, with 2670 tons afloat. The closing down of so many of the Tin Plate mills has naturally had a depressing effect upon the market here.

**Copper.**—Little or no change has occurred in the Copper market. The consumptive demand has been very light and prices have remained in buyers' favor. While there has been some decline in wholesale prices, jobbers' quotations are unchanged, Lake Ingot in small lots ruling at 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c. per lb., and Casting Copper 12 $\frac{1}{4}$ c. to 12 $\frac{3}{8}$ c. Exports so far this month show a total of 8200 tons. The market closed weak and tame.

**Sheet Copper.**—The demand for Sheet Copper continues in fair volume, with a good inquiry. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—The market for Pig Lead continues quiet with a firmer tone and no change in prices or in general conditions. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices report a quiet market for Pig Lead at that point, with a lack of features of importance. Prices are well maintained.

**Spelter.**—The scarcity of spot metal continues the predominant feature of the Spelter market, which has remained quiet and strong. Jobbers quote good Western brands in small lots at 6 $\frac{1}{4}$ c. to 6 $\frac{3}{8}$ c. per lb. St. Louis advices indicate a considerably smaller movement in the Spelter market, with prices the same as those of a week ago.

**Sheet Zinc.**—The demand for Sheet Zinc is of the usual proportions. Prices are firm and unchanged at 6 $\frac{3}{4}$ c. per lb. for 600 lb. cask lots, and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—No change is noted in this metal. Cookson's in small lots is selling at 10c. to 10 $\frac{1}{4}$ c. per lb.; Hallett's at 8 $\frac{3}{4}$ c. to 8 $\frac{1}{2}$ c. and U. S. at 8 $\frac{1}{4}$ c. to 8 $\frac{1}{2}$ c.

**Nickel.**—Is unchanged. Small lots rule at about 55c. to 60c. per lb.

**Aluminum.**—The demand for Aluminum is referred to as good and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market for Tin Plates is dull and uninteresting, with an absence of any important buying and no new developments of any kind, except that the volume of small orders received by the local Tin Plate jobbers was rather larger than for the last few weeks. The feeling in regard to the future appears to be unsettled, in view of the fact that so large a proportion of the Tin Plate capacity of the country is now idle. At the same time it is said that the stocks in manufacturers' and dealers' hands are of considerable proportions. Jobbers quote American Bessemer Coke Plates 1C, 14 x 20, at about \$4.70 to \$4.90 per box in moderate sized lots, delivered at New York or corresponding points. The Welsh Tin Plate market has suffered a sharp decline within the past two weeks, the price of Welsh Coke Plates dropping from 13s. 3d. to 12s. 6d. per box, Swansea.

**Sheets.**—The Sheet market is reported to be in a very unsatisfactory condition so far as new tonnage is concerned. Prices show some further signs of softening, especially on the part of some of the outside mills. Galvanized Sheets are also very dull so far as large business is concerned. A rather better trade is reported by jobbing houses in a retail way, but the demand for Thin Sheets is exceptionally dull. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at 3.60c. to 3.65c., and No. 27 Galvanized Sheets at 4.45c. to 4.60c.

Chicago advices are as follows: There has been quite an increased demand for Light Sheets; and Heavy Sheets, as heretofore, have sold well at full prices. Even Galvanized Sheets are selling a little more readily, but the market for the latter is heavy and weak. No. 27 Black Sheets in small lots from store are quoted at 3.45c. to 3.55c., and Galvanized Sheets at 4.55c. to 4.65c. for No. 27.

**Old Metals.**—Scrap Iron is in strong demand, which keeps full pace with the supply. Prices are very firm, but not quotably higher. Old Brass and Copper are dull and weak. Scrap Zinc and Lead remain firm. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                                        |                            |
|----------------------------------------|----------------------------|
| Heavy Copper.....                      | per lb. 10 c.              |
| Light and Tinned Copper.....           | per lb. 9 c.               |
| Heavy Brass.....                       | per lb. 8 c.               |
| Light Brass.....                       | per lb. 6 $\frac{1}{2}$ c. |
| Lead.....                              | per lb. 3 $\frac{3}{8}$ c. |
| Tea Lead.....                          | per lb. 3 c.               |
| Zinc.....                              | per lb. 3 $\frac{1}{2}$ c. |
| Pure Aluminum Sheet.....               | per lb. 22 c.              |
| Cast Aluminum.....                     | per lb. 17 c.              |
| No. 1 Pewter.....                      | per lb. 18 c.              |
| No. 2 Pewter.....                      | per lb. 9 c.               |
| Tin Plate Scrap, per gross ton.....    | to \$5.00                  |
| Wrought Iron Scrap, per gross ton..... | \$15.00 to 15.50           |
| Heavy Cast Scrap, per gross ton.....   | 13.50 to 14.00             |
| Stove Plate Scrap, per gross ton.....  | 10.00 to 10.50             |
| Burnt Iron, per gross ton.....         | 8.00 to 8.50               |

## THE PIG IRON MARKET.

**NEW YORK.**—Locally the market has been quiet, so far as new orders for domestic Pig Iron are concerned. The troubles as to fuel supply in the Lehigh Valley are becoming more acute and the production is falling off further. We do not hear of any additional sales of magnitude of foreign Foundry Iron and asking prices are a trifle higher. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity: No. 1 Foundry, \$22.25 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$21 to \$21.25.

**CHICAGO.**—As far as the volume of actual sales is concerned the Pig Iron market during the week may be said to have been dull; but, viewed from the standpoint of inquiry, there has been as much activity as ever. Were the Iron available, either for the current year or for 1903 delivery, the volume of business would have been considerable. There is much scurrying to obtain Iron for shipment during the next few months, and wherever it has been possible to obtain supplies higher prices have prevailed, No. 1 Southern Iron having sold as high as \$25 at furnace, Birmingham, equivalent to \$28.65 Chicago, while No. 2 has sold within \$1 of No. 1. The scarcity of Coke continues to be the most important feature, the furnaces and foundries alike being in daily need and expecting almost any hour to be compelled to stop. The following are the nominal prices for the first half of 1903:

|                                        |                    |
|----------------------------------------|--------------------|
| Lake Superior Charcoal.....            | \$26.00 to \$27.00 |
| Local Coke Foundry, No. 1.....         | 22.50 to 23.00     |
| Local Coke Foundry, No. 2.....         | 22.00 to 22.50     |
| Local Coke Foundry, No. 3.....         | 21.50 to 22.00     |
| Local Scotch, No. 1.....               | 23.00 to 23.50     |
| Ohio Strong Softeners, No. 1.....      | 25.00 to 26.00     |
| Southern Silvery, according to Silcon. | 22.60 to 23.00     |
| Southern Coke, No. 1.....              | 21.90 to 22.40     |
| Southern Coke, No. 2.....              | 21.15 to 21.65     |
| Southern Coke, No. 3.....              | 20.65 to 21.15     |
| Southern Coke, No. 1 Soft.....         | 21.65 to 22.15     |
| Southern Coke, No. 2 Soft.....         | 21.15 to 21.65     |

**PHILADELPHIA.**—There is no change in the Pig Iron situation, except that the metal seems to be scarcer and new business more difficult to arrange. The furnaces, as a rule, have sold so far ahead that they are afraid to increase their lines. Prices abroad are a little stiffer than they were a week ago, but this is offset by lower freight rates, so that sales are made at about the same prices as for some time past. Cargo lots, c.i.f., are about \$19 for Middlesboro, No. 3, and small lots, \$20 to \$20.50. Alongside or delivered in buyers' yards, the quotation is \$21 to \$21.50. Scotch Irons range from \$22.50 to \$23.50, and American at about the same figures as quoted in our last report for city or nearby deliveries during the first half of next year, with a premium of \$1 to \$1.50 per ton on this year's deliveries. We quote as follows:

|                      |                    |
|----------------------|--------------------|
| No. 1 X Foundry..... | \$23.50 to \$24.50 |
| No. 2 X Foundry..... | 22.00 to 22.50     |
| No. 2 Plain.....     | 21.00 to 22.00     |

**PITTSBURGH.**—The Pig Iron market is very strong, owing to the fact that the output is very restricted on account of the scarcity of Coke. There is some talk of a general shut down of the Valley furnaces next week unless the Coke situation improves. Foundry Iron is exceedingly scarce and can hardly be bought at any price. It has sold for delivery in the first quarter of next year at prices ranging all the way from \$21.50 to \$22.75, Pittsburgh.

## CHICAGO REPORT.

**Scrap Iron and Steel.**—The receipts from the country have increased but little, if any, and with a good outlet for dealers the market has remained firm and full prices have continued to prevail, but without further change. The following are the prices paid by dealers in carload lots, Chicago:

|                                    |                    |
|------------------------------------|--------------------|
|                                    | Per net ton.       |
| Country Wrought Scrap.....         | \$15.00 to \$16.00 |
| Machinery Cast.....                | 14.00 to 14.50     |
| Malleable Cast.....                | 12.00 to 13.00     |
| Stove Plate (free from burnt)..... | 10.50 to 11.00     |
| Burnt Iron and Grate Bars.....     | 8.50 to 9.50       |
| Sheet Iron and Hoops.....          | 9.00 to 10.00      |
| Plow Steel.....                    | 13.00 to 13.50     |
| Breaking Stock.....                | 12.00 to 12.50     |

|                                                        |                |
|--------------------------------------------------------|----------------|
| Old Boilers—whole (Iron).....                          | 9.50 to 10.00  |
| Old Boilers (Iron) cut in single Sheets and Rings..... | 13.00 to 14.00 |
| Old Gas Pipe and Boiler Tubes.....                     | 13.00 to 13.50 |
| Cast Borings.....                                      | 9.00 to 9.50   |
| Turnings.....                                          | 12.50 to 13.00 |
| Horseshoes.....                                        | 13.00 to 13.50 |

**Old Metal.**—Copper and Brass have continued quiet and easy in tone under liberal offerings and little demand, but Zinc and Lead have continued firm. Dealers are ready buyers at quotations. The following are the prices paid by dealers in this market:

|                            |                     |
|----------------------------|---------------------|
|                            | Per lb.             |
| Copper Wire and Heavy..... | 10 $\frac{1}{2}$ c. |
| Copper Bottoms.....        | 9 $\frac{1}{4}$ c.  |
| Copper Clips.....          | 10 c.               |
| Red Brass.....             | 10 $\frac{1}{4}$ c. |
| Yellow Brass.....          | 8 c.                |
| Red Brass Borings.....     | 9 $\frac{1}{4}$ c.  |
| Yellow Brass Borings.....  | 7 c.                |
| Light Brass.....           | 6 $\frac{3}{8}$ c.  |
| Pipe Lead.....             | 3.70c.              |
| Tea Lead.....              | 3.35c.              |
| Zinc.....                  | 3.45c.              |
| Tin Foil.....              | 21 c.               |
| Pewter, No. 1.....         | 18 c.               |
| Pewter, No. 2.....         | 11 c.               |
| Aluminum.....              | 20 c.               |

**Old Rubber.**—The market has been steady, with moderate offerings and a fair outlet to dealers. Prices have remained as previously quoted. Dealers buy at the following prices, Chicago delivery:

|                            |              |                    |
|----------------------------|--------------|--------------------|
|                            | Per net ton. | Per lb.            |
| Garden Hose.....           | \$25.00      | .....              |
| Air Brake Hose.....        | 45.00        | .....              |
| Rubber Shoes.....          | .....        | 7 c.               |
| Rubber Car Springs.....    | .....        | 5 c.               |
| Inside Bicycle Tubing..... | .....        | 22 c.              |
| Outside Tubing.....        | .....        | 5 c.               |
| Black Rubber.....          | .....        | 4 c.               |
| White Rubber.....          | .....        | 8 $\frac{1}{2}$ c. |

**Rags.**—The market has gradually hardened in tone, offerings, especially of Woolen Rags, being light. Dealers are more ready buyers of Country Mixed at 75c. to 85c. per 100 lbs., Chicago delivery.

**Anthracite Coal.**—The conditions previously noted have been aggravated, receipts being light and demand more and more urgent, resulting in a further advance of \$1.50 to \$2.50 per ton during the week. Wholesale dealers have purchased the few cars offered at \$8 to \$8.50 per ton, and there were sales to-day of 70 to 100 tons, egg size, at \$9.50 on track. No news of any encouraging nature has been received from the mines. We omit the regular table, prices being erratic.

## THE HARDWARE TRADE.

Seldom have general conditions been so satisfactory. The volume of business is now reported to be increasing from week to week. The distribution from jobbers to retailers is on a heavy scale, as shown by the urgent demand for manufacturers to hurry shipments on back orders. The movement in Builders' Hardware is reported larger than at any previous time. Fresh orders are being booked from buyers, who say that they had supposed themselves amply supplied for the fall trade. These orders are coming from nearly all sections of the country, but are especially heavy from the Northwest and the Pacific Coast. Building operations are being pushed actively in the strictly agricultural sections of the country as well as in the cities. The improvements thus under way are increasing the demand for Nails and other staple goods, and some branches of trade which have recently been quiet are now taking on improving conditions. It is observed that merchants who have had sufficient faith in the stability of values and the maintenance of a good demand to keep well stocked are now reaping the reward of their confidence, while those who hesitated, looking for a reaction, are suffering from scanty supplies which cannot be quickly replenished. A significant feature of current business is the equanimity with which any weakening in price on some staples is regarded. It seems to breed no great distrust, but is simply considered as an incident peculiar to its own line. Changes thus made, however, are not important, and probably more advances than declines are to be noted. Consolidations of manufacturers of sundry articles, such as Steel Goods, Axes, Axe Handles and Grindstones, and closer relations, as in the case of Scythe manufacturers, promise a stiffening of prices in the products thus affected. The developments in this direction are therefore interesting and will be closely followed by the trade.

## NOTES ON PRICES.

**Plumbers' Supplies.**—Some increase in the demand for Plumbers' and Steam Fitters' Supplies was noted during the week, both from the out of town and city trade. A good deal of work is going on in the city limits, both in the way of new construction and repairs. The influence of the usual summer holiday dullness seems to be passing away and the trade is preparing for a season of active work. Prices are well maintained throughout the whole line with upward tendency in some directions, notably in Iron goods. The condition of the market for raw material makes it evident to consumers that no decline in the price of goods into which Iron enters may be expected this year. The demand for Cast Iron Pipe and Fittings in particular is very heavy and prices have an upward tendency. Brass Goods are moving in fair volume and with prices fairly maintained.

**Galvanized Pails.**—The manufacturers of Galvanized Pails have advanced prices about 4 cents a gross. The demand for all kinds of Galvanized Ware is referred to as active, and the factories are fully employed on orders.

**Coffee Mills.**—Some of the manufacturers of Coffee Mills have advanced the price of these articles in consequence of the high price and scarcity of raw material.

**Solder.**—Owing to a sharp decline in the Pig Tin market the manufacturers of Solder have reduced their prices. Half and Half Solder, guaranteed, is quoted in small lots at 19 to 19½ cents per pound, and No. 1 at 16½ to 18 cents.

**Wire Nails.**—Persistent reports were in circulation during the week that a reduction in the price of Wire Nails would be announced about September 1. As far as can be learned, however, no authority for such a statement exists. Business is of fair volume for the season the fall demand not yet having begun. Prices are unchanged, small lots from store, New York, being quoted at \$2.25 to \$2.30 per keg.

**Cut Nails.**—Conditions in the New York Cut Nail market are unchanged, with a moderate demand. Manufacturers are said to be falling somewhat behind their orders, owing to lack of transportation facilities. Small lots of Cut Nails from store are quoted at \$2.30 per keg.

**Window Glass.**—A more hopeful view is taken of the future of the Glass market. It is believed that the independent Glass interests and the American Window Glass Company are likely to come to some sort of an agreement as to limiting the output. This would give the companies an opportunity of disposing of their stock of Glass on hand, and probably avert a price war. The Jobbers' Association quotation for Single and Double Strength Glass from store continues at 88 and 5 per cent. discount.

**Linseed Oil.**—The reduction in the price of Linseed Oil has not influenced buyers to come into the market to any extent, while, on the other hand, the lack of demand and anxiety on the part of some holders to sell has resulted in lower quotations for out of town brands. Small lots of Oil are moving fairly well. City Raw is selling in a retail way at 61 to 61½ cents per gallon, Boiled Oil being 2 cents per gallon advance on Raw. Out of Town Raw is quoted at 60 to 60½ cents per gallon.

**Spirits Turpentine.**—Some activity has been developed in the Turpentine market during the week, as a result of a stronger feeling in the South and a reduction in supplies in the hands of local consumers. Prices have advanced ¼ cent per gallon, Turpentine in small quantities being now quoted at 47¼ to 47¾ cents per gallon.

THE GRAND RAPIDS STREET RAILWAY COMPANY of Grand Rapids, Mich., will try a new method of heating their cars this winter, the electric heating formerly used having proved too expensive and too much of a drain on the current which furnishes the motive power for the cars. Some of the company's cars are now being fitted with a furnace located under the floor of the car, between the trucks, the heat entering the car through a

register in the floor. The furnace will also act as a ventilator, the pure, outside air being heated as it passes through the furnace into the car in a similar manner as a house furnace is regulated.

Consul J. F. Freeman of Copenhagen, Denmark, reports that a new material for plastic art, to which is given the name of Terralit, has recently come into extensive use in Denmark. The inventor is Ivar Hjort of Copenhagen, who has experimented with his material for the last two years. It is produced by a chemical process which has not been made public. A peculiarity of Terralit is that it gives the same color and appearance as the original which it is sought to represent, whether it be copper, marble, bronze, porcelain or ceramic ware. An exhibit has recently been opened in Copenhagen of 40 or 50 of the most celebrated ancient and modern busts, statuettes and animal figures made of this material. The imitations of bronze are said to be particularly successful.

G. A. Fichtenmueller, Farmington, Iowa.

**THE NEW METAL WORKER PATTERN BOOK.**

**A Course in Pattern Cutting as Applied to all Branches of Sheet Metal Work**

Is set forth in The New Metal Worker Pattern Book. This fine work is recognized as the only complete exposition of the subject. It is adapted to the wants of both the beginner and of the more experienced pattern cutter, beginning with ample instructions in drawing geometry, the principles of pattern cutting, etc. (all in relation to sheet metal work), and finally demonstrating 218 problems, which include every example of work ordinarily met with in pattern cutting.

Every student should have The New Metal Worker Pattern Book, and no tin or cornice shop is properly equipped without it.

430 pages; 744 illustrations; size, 10 x 13 in.; price \$5.00.

Send for descriptive circular with sample pages.

— PRACTICAL PHILOSOPHY.—Daughter:  
 "Pa, dear, what is the difference between  
 accident and fate?"

Pa: "That buttons fly off a man's  
 clothes is accident. That a man's wife  
 never sews them on is fate."—*New York  
 Press.*

— A BRUTE.—Miss Koy (in street car):  
 "It's really very kind of you, Mr. Crabbe,  
 to give me your seat."

Mr. Crabbe: "Not at all. We men are  
 getting tired of being accused of never  
 giving up our seats except to pretty girls."  
 —*Philadelphia Press.*

— THE FIRST FALL.—"The snow is  
 quite comprehensive," said Mr. Beechwood  
 to Mr. Homewood.

"Meaning what?" replied the latter, in-  
 terrogatively.

"It covers the ground."—*Pittsburgh  
 Chronicle.*

— A RURAL LONGING.—"Say, our book-  
 keeper is foolish."

"What do you mean?"

"Why, he says when he gets old he  
 wants money enough to go out and live  
 where he can see the moon go down be-  
 hind a hedge."—*Chicago Record.*

— RESIDUARY LEGATEE.—Ascum: "Mr.  
 Hammond of your city is very wealthy, I  
 believe. Did he make all his money him-  
 self, do you know?"

Miss Backbay (of Boston): "Oh! no.  
 The bulk of it was a—well—er—a limbacy  
 from his father."—*Exchange.*

## Iwans' Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

- 1st. It holds pipe one inch from building to permit painting.
- 2d. It looks ornamental.
- 3rd. It can be used for frame or brick buildings.
- 4th. It can be used for round or corrugated pipe.
- 5th. It completely encircles the pipe, holding it firmly on all sides.
- 6th. It is strong and durable.
- 7th. It is cheaper than any other hanger.
- 8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe  $2\frac{1}{2}$  inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwans' Chimney Top.

# TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES,  
DIAGRAMS and TABLES  
= By H. K. VosBurgh =  
NEW AND IMPROVED EDITION

**A** USEFUL hand-  
book for tin-  
ners and other  
mechanics, treat-  
ing simple prob-  
lems in pattern  
cutting, such as  
are of daily occur-  
rence in the shop.  
An elementary  
manual for the  
young tinsmiths  
A handy reference  
for all sheet metal  
workers.

120 Pages  
53 Figures

An Invaluable . . . . \$1.00  
Pocket Companion . .

## Section 1 ✧ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

## Section 2 ✧ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

## Section 3 ✧ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

**JANNEY, STEINMETZ & CO.,** Drexel Bldg Philadelphia.

# A Prophecy

**50 years from now--in 1952**

There will be an astonishing large number of roofs in perfect condition that were put on in 1902.

They will be G. A. P. H. Roofs, stamped thus:

GUMMEY'S  
I G  
ANTI-PINHOLE

ALL ABSOLUTELY PURE CHARCOAL IRON.

Gummey, McFarland & Co., - = Philadelphia.

## DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

**STEEL & IRON ALUMINUM COATING CO.,**

CONNELLSVILLE, PA.

**How  
to  
Make  
the  
Best  
Roof**

MF Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of MF Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

**MF  
Roofing Tin**

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

Write to { W. C. CRONMEYER, Agent,

96 inches long.

Our Improved Eureka  
Cornice Brake. Will bend  
No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.  
With Lever Arc, Automatic Gauge. Will cut No. 2 iron  
97 inches long.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel  $\frac{1}{8}$  inch thick, cut off and mitre angle iron  $\frac{1}{8}$  inch thick, and do it perfectly.

## The Cinderella Air Tight

FOR SOFT COAL, HARD COAL OR COKE.

It is the Limit of Durability in Stove Construction.

Its reputation has been made largely by its capacity for work and its ability to stand hard knocks.

ITS SHAPE AND ITS WEIGHT MAKE IT LAST; SHAPE HELPS AS MUCH AS WEIGHT, BUT FOR THE RESULTS OBTAINED BOTH WERE NECESSARY.

It is accurately fitted, this makes it a CLEAN STOVE.

Its beautiful design and elegant nickel make it a HANDSOME STOVE.

Being a circulator and double heater makes it a POWERFUL STOVE.

Perfect fitting and a smoke consuming device make it an ECONOMICAL STOVE.

Being easily controlled helps to make it a PERFECT STOVE.

We have sold thousands of them, yet our repair business on it is almost nothing.

It is a Cinderella and it Never Fails.

MADE BY

**The Pittsburgh Stove and Range Co.,**

PITTSBURGH, PA.

Western Sales Agent, W. D. SAGER, 30 to 40 Michigan Street, Chicago, Ill., Chicago's Busiest Stove Jobber.

## "THE QUEEN" HOT BLASTS

# MONARCH

## RADIATOR

No 44

Entirely new patterns for 1902. Elegant, Efficient, Excellent. Polished Nickel or Aluminum finish top, feet and jewel frames, set with cut faced jewels through which the gaslight makes a brilliant effect. Heat chamber below top with pipe collar for flue connection. Each tube equipped with two three-foot Scotch tip illuminating burners, producing an intense heat. Tubes Russia iron, the whole effect very striking.

### A CALORIFIC WONDER.

Improved for 1902 by the substitution of CAST IRON fire-box section in place of sheet steel, the intense heat generated making this necessary. Two 15-inch burners, with four rows of gas orifices in each, produce a terrific fire which quickly sets the incandescent brick chinkers to glowing and MONARCH Ventilating and Radiating System of pipes combine to make this the equal of a Hard Coal Base Burner.

DIMENSIONS. — Height 33 inches. Width, 20 inches. Depth, 13 inches.

## SOME RIPE EXPERIENCE

has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business, but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

# The New WALKER BOILER

for Steam: for Water

Our boilers for either Steam or Water Heating will extract more heat from a shovelful of coal and keep the radiation warmer and at a more even temperature than any other boiler. Why? Because every part of its highly effective heating surface in the fire box, or over the fire, is exposed to direct heat. Boilers are fitted with all best and latest improvements, easy to clean flues and to operate. We want you to become acquainted with our productions. It will pay you. Burn any kind of fuel.

For Steam or Water.

OFFICE OF  
**M. H. SULLIVAN & SON,**  
High-Glass Painting and Decorating.

FALL RIVER, MASS., January 10, 1902.

DIGHTON FURNACE CO.,  
Taunton, Mass.

*Dear Sirs:* The Dighton Furnace with Hot Water Combination attachment, which was installed in my residence a couple of years ago, is very satisfactory in every way.

It requires very little care and uses less fuel than any furnace I have ever had any experience with.

Several of my friends now use the "DIGHTON," having bought through my recommendation, and they speak as highly of it as I do, and recommend it, especially for its economy of fuel.

Yours truly,

M. H. SULLIVAN.

# GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

## Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnery and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

### PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

**Chapter I.—Furnaces**—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

**Chapter II.—House Heating**—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

**Chapter III.—The Combination System**—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

**Chapter IV.—Air**—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

**Chapter V.—Heating and Ventilation of Buildings**—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

**Chapter VI.—Heating of Public Buildings, Churches and Stores**—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

**Chapter VII.—Fan-Furnace Combination System**—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

**Chapter VIII.—Temperature Control.**

**Chapter IX.—Estimate and Contract Blanks.**

**Chapter X.—Value of Fuels.** The Proper Size for Furnace Chimneys—with tables.

### APPENDIX.

**Furnace Fittings.**—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

SENT, POSTPAID, ON RECEIPT OF PRICE, \$1.50

**HENRY N. CLARK CO., 56 and 58 UNION ST., Boston, Mass.**

A Tea-Kettle Boils Quicker on  
my Chimney than on my Stove.

A fire in a red glow represents 1200 degrees of heat, a draft through this carries the heat out of the chimney unless intercepted by a cross tube **Rochester Radiator**, when nearly all this waste heat is conveyed into the room by the rapid circulation of air through the tubes and saved. This appeals to common sense and is verified by the most thorough scientific test.

The **Rochester Radiator** is a satisfactory article to sell and one that affords the dealer a good profit.

## A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house, chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

|                                                                                                                                                                                                                                                             | Page.  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| POINTS ON CHIMNEYS                                                                                                                                                                                                                                          | 7-32   |
| An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done. |        |
| DEFECTIVE FLUES                                                                                                                                                                                                                                             | 33-35  |
| This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.                                                                                         |        |
| HOW TO IMPROVE A WEAK CHIMNEY                                                                                                                                                                                                                               | 36-40  |
| VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS                                                                                                                                                                                                                | 41-45  |
| CONDENSATION IN STOVE PIPES                                                                                                                                                                                                                                 | 46, 47 |

Sales Agency for  
ALUMINUM and ELEC-  
TRIC OIL HEATERS.  
Best on Earth.

## The YANKEE Hot Air DAMPER (IMPROVED.)

HOT AIR.

THE YANKEE EXCELS.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market.

It is impossible for this rod when in position to move either way.

ROD POINTS: Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of 1/4 in. cold-rolled steel and slips into damper very smoothly. Sample sent to any Dealer without charge.

SMOKE PIPE.

No. 5  
Fire Pot

**90 x .05 = \$4.50.**

With an ordinary Fire Pot you use one gallon of gasoline each day. With a No. 5 Fire Pot you use less than half a gallon.

With gasoline at 10c. a gallon you save 5c. each day. If you save 5c. a day, in 90 days you have saved the cost of the Fire Pot. *Did you ever think how much you lose by using a poor Fire Pot?* If you lose 5c. each day on each Fire Pot, in 300 days you lose \$15.00 on each Fire Pot. Can you afford to do it? Remember *our name on a Fire Pot means your money back if not pleased.* Jobbers sell at factory price.

## ABOUT ESTIMATE BOOKS

For Plumbers and  
Heating Men

*Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.*

W. C. BENNETT & CO., Haverhill, Mass.

*We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.*

W. R. PARK & SON, Taunton, Mass.

*A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.*

CHAS. W. COOMBS, Lawrence, Mass.

*Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.*

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "CONTRACT AND ESTIMATE RECORD BOOKS" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

## CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates.  
Size 8 x 11 inches. Cloth bound, **\$1.50**  
500 Pages. Arranged for 250 Estimates.  
Size 8 x 11 inches. Cloth bound, **\$2.50**

POCKET EDITION.

200 Pages. Arranged for 50 Estimates.  
Size 3½ x 8 in. (oblong). Flexible cloth  
binding, **\$0.50**

## CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates.  
7 x 12 inches. Cloth bound, **\$1.50**

**NOTE.** The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

### Our Imports of Iron and Steel.

As foreshadowed for months in the market reports the imports of iron and steel into this country have assumed notable dimensions. During July the iron and steel products brought into this country from abroad were valued at \$4,163,147, as compared with \$1,958,579 in July, 1901, while the imports during the first seven months of 1902 figured up \$19,334,418, as contrasted with \$10,344,610 during the first seven months of 1901 and \$12,992,934 during the corresponding period of 1900. The figures for seven months, however, hardly reflect the magnitude of the movement, because it did not really seriously begin until the second quarter of the current year. This is reflected in the data published by the Treasury Bureau of Statistics. In April the aggregate was 46,018 gross tons, in May it was 82,235 tons, in June it rose to 98,526 tons, and as the table printed below shows, it reached 128,551 tons in July. Developments during the past month justify the belief that the July rate will not alone be maintained for the balance of the year, but that we may witness a further increase.

Imports of Iron and Steel.—Gross Tons.

This table, of course, furnishes figures for only a part of the tonnage. The details relating to other branches of the trade disappear in the general figure of "all other manufactures," so that the actual tonnage is really larger. On the other hand we must take into account that a part of the goods imported are not intended for home consumption, but are re-exported under drawback arrangements. This is notably true of tin plate.

Then we consume a certain amount of foreign iron and steel at all times. This applies usually to iron bars, mostly Swedish material required for special purposes, to certain kinds of crucible steel and shapes made therefrom. Making all allowances, it looks now as though

we shall import iron and steel in different forms equivalent to at least 1,000,000 tons of pig iron and scrap in excess of our usual importations, or deducting old material, an equivalent of about 900,000 tons of pig iron, to get down to the foundation of it all. In other words, our home consumption may fall off at the rate of fully 1,000,000 tons per annum before we begin to feel the pressure upon our domestic producers, or we must in one form or other produce 1,000,000 tons more of material in its equivalent of pig iron before we can stop importations, the demand continuing at the present rate. That of course looks like a safe margin for a considerable time to come, but we know that production is going to increase before the close of the year and we have only too often witnessed a sudden falling off in the requirements of the country to feel particularly comfortable with a margin apparently so great.

### Price Cutting.

Owing to the activity of general business and the high prices which have ruled in the markets for raw materials in many lines, unusually little complaint has been heard this year in regard to the cutting of prices. Most manufacturers and dealers in the lines represented by this paper have been able in the past season to obtain about all the business they wanted without any special strenuous efforts. Quite lately, however, rumors have been current of concessions in prices made in some quarters, in order to secure business, which price cutting is held to be without justification. The folly of cutting prices when business is of satisfactory volume is so obvious that it seems scarcely necessary to call attention to it. When business is unusually dull and sharp competition prevails to secure a share of what trade is going, there is some excuse for those tradesmen who must have cash to offer some of their goods at a sacrifice. But no such excuse appears to exist at the present time. There is enough business to go around in nearly all lines, and it is to be hoped that those engaged in the trades in which our readers are interested will steadfastly resist the temptation to quote lower rates for any of their goods than are fully justified by the conditions of purchase and sale and of the general market. It is probably within the experience of all that one case of price cutting has in many instances caused the temporary demoralization of the entire market for certain lines of goods, which would otherwise have held firmly and yielded a reasonable margin of profit to the seller. Price cutting is seldom justifiable. It is an especially suicidal policy when business is of ample proportions and all tradesmen have the opportunity of making good profits, providing they exercise reasonable moderation in their desire for sales. The spirit of greed that tries to grab all the business in sight, regardless of the general good of the trade, should be discountenanced. "Live and let live" should be the motto of every fair dealing tradesman.

### The Need of Trade Education.

In a recent address on the subject of technical education in the South, delivered before the Georgia School of Technology, Richard H. Edmonds, editor of the *Manufacturers' Record*, made a very strong appeal to the

South to give its youth the opportunity of learning trades and handicrafts, in order to build up the young manhood and womanhood of that section of the country, as well as its material prosperity. Mr. Edmonds showed the great advances the South is making in manufacturing industries of all kinds and urged the provision of more technical and trade education, so that the boys of the South may be trained up to take their proper part in the industrial development of their section of the country. Within the past decade the capital invested in manufactures in the South has quadrupled, and with the development of the natural resources of that section of the country, now being rapidly pushed, the growth of its industries is likely to increase many fold in the years to come. All this will involve the need of a large body of trained mechanics and workers in the mills and factories which are springing up in all parts of the country south of the Mason and Dixon line. Only proper trade instruction can be relied upon to furnish the necessary skilled labor. The raw material for labor of this class exists in amply sufficient quantities in the South, and merely needs to be molded into shape to furnish all the skilled workers necessary. Mr. Edmonds' argument, moreover, will apply to other parts of the country as well as to the South. There is a crying need throughout the United States for more facilities for the trade and technical education of our boys and young men. As we have shown before, foreign nations have realized the supreme economic importance of trade training and are paying the greatest attention to this work at the present time, whereas the United States, as a nation, does not yet seem alive to the prime necessity of taking up and pushing this movement, notwithstanding that the markets of the world are awaiting her manufactures.

### Jobbers and Retailers.

The question of trade protection would seem to be rather a simple matter as between a jobber and a retailer in the hardware trade. The jobber builds up his business by cultivating the patronage of the retail trade. It matters not what other fields he may invade, as from none of them, and indeed not from all of them combined, would he receive sufficient trade to entitle him to a place as a hardware jobber. Railroad trade may be of enough importance to claim the attention of a special salesman, local manufacturing development may be large and varied enough to warrant a specialist to look after it, or a retail department may be a profitable adjunct, but it is absolutely necessary to have the trade of a large number of retail dealers. The interest of the retail dealer being the essential element should be conserved above all others by those who assume to conduct a jobbing business. This is the rule which should be laid down for the government of a jobbing house, and if it were carefully and rigidly followed would eliminate the friction which exists in too many sections. Representatives of jobbing interests freely acknowledge their dependence upon the retail trade, especially when some occasion demands a public utterance on the subject, but that they too often disregard the obligation resting on them of observing the rights of their best customers is shown by the charges brought against them whenever the relations of jobbers and retailers come up for discussion.

The recent destruction by fire of the co-operative village of Ruskin, Ga., marks the termination of a persevering attempt to maintain a settlement upon purely

communistic principles where the industrial possibilities were limited and the climate of such an enervating character as to discourage great physical activity. Ruskin was organized a number of years ago by about 100 persons, who planned to make a model settlement on purely communistic lines. All the original settlers put into the common fund the whole of their possessions and drew out from it simply enough to meet their absolute necessities, sharing all the agricultural products and dividing up among themselves the various duties of the community. On account of the reasons before referred to the community did not grow, but on the other hand lost in numbers by the departure of some of the members from year to year, until, of late, Ruskin was in a very unprosperous condition, with a small and needy population gaining a precarious livelihood from the fruits of the soil without means of earning more than a bare subsistence. The fire which has now destroyed the settlement merely hastened its inevitable extinction. Ruskin adds one more to the list of socialistic schemes which have been started in this country only to fail.

### A 2240-Pound Ton of Pig Iron.

Some months since a movement was started by some of the Southern blast furnace owners to adopt a uniform ton of pig iron of 2240 pounds, this to include Bessemer, foundry and forge iron. It is claimed, and with good reason, that the present practice of selling basic and chilled metal in tons of 2240 pounds and the other grades of sand iron at 2268 pounds leads to more or less confusion in the trade and should be eliminated if possible. In order to secure a uniform ton of 2240 pounds letters were sent out by a leading Southern furnace interest to Northern blast furnace operators, asking their co-operation in securing a uniform ton of 2240 pounds of pig iron to apply on all grades. The result of this movement has been that a number of the furnaces in the Mahoning, Shenango and Hocking valleys and elsewhere have already adopted the 2240-pound ton, and others will likely do so in a short time. The furnacemen whose stacks run on foundry iron point out the fact that much of their output has to be broken for their foundry trade, and in doing this the greater part of the sand and scale is removed and the buyer gets clean iron. For this reason many of the furnaces are already billing foundry iron at 2240 pounds to the ton and others will soon do the same. The furnace operators who run on Bessemer and forge, while lacking the arguments used by the foundry iron makers, are almost a unit in favor of the 2240-pound ton and will adopt it just as soon as certain contracts have been filled with buyers who insist on the 2268 pounds. It would seem to be to the best interests of the maker of iron, as well as the buyer, to have a uniform ton and the indications are that it will only be a short time until it is adopted.—*The Iron Age*.

One result of the anthracite coal strike and the prospect of scarcity and high prices of fuel in the coming winter is noted in New York City in an unusually active demand for flats and apartments. Thousands of families are said to be contemplating moving from houses into flat buildings, where the expense of heating is borne by the owners.

The report of the committee sent over to the United States, presented at the thirty-fifth annual Trades' Union Congress, which opened on Monday, in London, England, says that the committee were greatly impressed with the advantage American trades unionists possessed over the British by the willingness of the President and other officials to consult at all times with accredited union representatives. An interesting statement in the report is that the trusts up to now have made no bad use of their combinations, but, on the contrary, have tended to increased wages.

## REMINISCENCES OF A PIONEER STOVE MAN.

To the Editor: Doubtless you have observed that there are periods in the lives of men, after having passed the three-score milestone of life, when they become of a reminiscent turn of mind and their thoughts revert to incidents which occurred in earlier years. Especially is this true regarding those once active and prominent in the business affairs of their time. I began to acquire my practical experience in the year 1839, and I have passed more than 52 years of my life in one and another department of the stove industry, first as stove plate molder, second as superintendent of molding department and third as manufacturer. The establishment with which I was connected was located in Troy, N. Y.

Having been connected with a stove foundry in the infantile period of the stove industry, the growth and development of which I have witnessed until now it has reached mammoth proportions, I cannot divest myself of the interest I feel in all the latest and exceedingly attractive designs of parlor stoves and cooking ranges illustrated in *The Metal Worker*. Even hot air and hot water heaters and steam boilers, in their ornamentation and elegant proportions, evidence the refined taste of the designer and pattern maker. It is evident that the manufacturers of the present day fully appreciate the necessity of producing goods possessing artistic finish, which while reflecting credit upon themselves as manufacturers will also exert an influence of a refining nature upon every member of the various households wherein these goods are introduced.

Reference to the records of your list of subscribers for *The Metal Worker* about 1875 or 1876 will reveal the fact that I was the first subscriber and also the first to advertise in your excellent journal in this city. I introduced your canvasser to the late firm of Link & Mahony of this city, and they were the second party whose patronage was at that time secured by him.

In recalling the incidents connected with the stove industry of the country, my thoughts naturally revert to the pioneers, the actors, of those early years, and, if I may be permitted its use in this connection, "the promoters," now nearly all long since passed from earth to the land of "forever." It was my good fortune to have enjoyed the personal acquaintance of nearly every prominent stove founder and manufacturer in the period referred to. The leading stove manufacturers of the present day were either unborn or in their swaddling clothes when the great industry in which they are now so prominent was in its infancy. Were I to marshal all the names of those pioneers the number would require nearly a column of *The Metal Worker*.

I cannot refrain, however, from presenting to your readers several names of those who stamped their individuality upon the development of the industry referred to. Prior to 1830 Henry Stanley of Poultney, Vt., manufactured the Stanley parlor stove and a cooking stove for wood arranged with a rotary top. Mr. Stanley turned out an excellent quality of work, noted for its smoothness of surface. The Stanley parlor stove was during many years the most popular coal burning parlor stove on the market. Israel Rathbone, uncle to the late John F. Rathbone and Samuel H. Ransom and Albion Ransom, was the pioneer of the stove industry of Albany. The present firm of Rathbone, Sard & Co. of that city are the lineal successors therefore of Israel Rathbone. Their enterprise is fully recognized not alone in our own country but in other lands. John S. Perry and Mr. Littlefield, as also Shear, Packer & Co. of Albany, now all passed away, gave prominence to the stove industry of that city. The goods they produced made their impress upon manufacturers of other cities to the extent of compelling them to introduce stoves practically of the same design and finish and constructed upon the same principle—namely, the self feeding type. Jasper Van Wormer, now living, of Albany, is entitled to rank among the earlier manufacturers of that city. The old firm of Van Wormer & McGarvey were noted for the progressive spirit manifested by them

when they entered the field as manufacturers nearly 45 years ago. During many years the late firm of S. H. Ransom & Co. of that city did a mammoth stove business. Each and all of the above named persons and firms reflected credit upon the capital of our State because of their enterprise and business ability.

In Buffalo the old firm of Jewett & Root held high rank during many years. The boast of each member of the firm was that he was a practical mechanic, and I know that on more than one occasion their mechanical knowledge in the conduct of their business enabled them not only to maintain their manhood but their independence when their operatives sought to control the business of the firm. The name of the late Giles F. Filley of St. Louis will be readily recalled by nearly all of the manufacturers of the present day. A most genial, noble, large hearted man was he. I think his sense of business honor excelled that of any manufacturer or business man whom I have ever known. His last days were days of sorrow and sadness because of his overconfidence in one who posed as his friend and led Mr. Filley on to financial ruin. Mr. Filley in those earlier years contributed his full share to the upbuilding of manufacturing interests in St. Louis. In Detroit we have among the more prominent names that of Wm. H. Tefft, long since passed away. He was among the aggressive pioneers of that city, starting in the later sixties. In 1860 there was not a stove manufacturer in that city. Neither was there as late as 1865. I sold stoves in Detroit made by my firm in this city in 1865. There was no foundry there then.

Troy has produced men connected with the stove industry whose history will compare favorably with that of any of those named. In 1812 a man by the name of Stratton established a small foundry on Sixth street, south of Broadway, for the purpose of conducting a general jobbing business and also incidentally produce some stoves, which we may readily conclude were of a very primitive character. An incident connected with the Stratton plant was told me many years ago by a man then far advanced in life. He informed me that in 1814, subsequent to the battle of Plattsburgh and Champlain, many of the English soldiers deserted and came down into this section of the State. Among the number were some half dozen practical molders, and Stratton gave them employment. Those British soldiers therefore may justly be regarded as having been genuine pioneers in the molding of stoves in this city of Troy. The late James Wager during many years owned and occupied the Stratton site as a stove foundry. He was succeeded by the following named firms, who owned and conducted business on the same site; Wager & Dater, 1840; Wager, Pratt & Co., 1846; Wager, Richmond & Smith, 1852; Smith & Sheldon, 1855; Smith, Sheldon & Co., 1858, and Sheldon & Greene, 1861. In 1878 the old plant was disposed of to parties engaged in the shirt and collar business. It is now used for that industry. Among the early firms of Troy I recall the following: Johnson, Geer & Cox, John Morrison, Morrison & Manning, Davy & Anthony, Davy, Ingram & Phillips, Anson Atwood, Swett, Quimby & Perry, Fuller, Morrison & Co., Fuller, Warren & Co., Morrison & Colwell, Eddy, Corse & Co., Bussey, McLeod & Co., Hicks & Wolfe and others.

I find in looking over the record of those formerly conducting the stove business of this city that I am the oldest in years of service connected with the industry. G. G. Wolfe, of the old firm of Hicks & Wolfe, still survives. Esek Bussey is still living, although not as long connected with the business as either Mr. Wolfe or myself.

CHAUNCEY O. GREENE,

Formerly of SHELDON & GREENE.

TROY, N. Y., August 28, 1902.

THE NEW YORK COMBUSTION COMPANY, with principal office at 259 Washington street, Jersey City, N. J., have been incorporated with a capital of \$1,000,000 to manufacture Heaters, Furnaces, &c. The incorporators are W. S. Fennendo, Carlyle Garrison and Michael J. McTiernan.

## STICK TO THE OLD MAN AND THE OLD STAND.

BY JEEMS.

The retail stove business, with the other lines usually attached to it, including plumbing, is not an inviting field as a rule for the sons of those who have started and built it up. For some reason it will usually be found that the sons early imbibed a distaste for the father's trade. They have sought new fields for business ventures which very often have not proved as favorable as if they had stuck to the old man and the old stand. To be sure, there are many notable instances whose history would doubtless make very interesting reading for *The Metal Worker's* patrons, and it will often be found that the downfall of a family dates from the time when the business of father and son parted. The disappearance of old concerns is perhaps much more rapid in New York and vicinity than elsewhere, as trade conditions change greatly in large cities.

A rather unusual circumstance therefore happened in Brooklyn the past week, in which the father transferred a good going business in furnaces, stoves, plumbing, &c., to his son for the consideration of \$1, &c. The business had been originally given to him by his father for the same price, so that the grandson continues it with ample capital and a trained knowledge, as he learned both plumbing and tinsmithing and is a thorough mechanic as well as a good business man. He seems destined to be successful, as he has grown up with the customers and neighbors. The facts in this case are as follows: Henry Leach, the grandfather of the present proprietor, established the business in the same store, 1103 Fulton street, Brooklyn, in 1861. He had only a small capital but a helpful family who assisted in the business. He retired in 1881 with an ample competence, giving the stand to his son, Henry, who now in his turn transmits it to his son. The senior will spend his time in cutting coupons and collecting interest and rents, and will increase the pile that will come to the family in the future.

There is no intention to be eulogistic in announcing this matter, but simply to point out an exceptional case in Greater New York. A few others can be named. The descendants of W. & J. Dixon, Atlantic street, Brooklyn, continue a very old establishment in the same family, and M. Abbott's Sons, Eighth avenue, New York, will probably be handed down to grandchildren. So it would appear that it is not a bad idea to stick to the old man and the old stand.

## THE GRATE-SPIRAL HEATER.

An illustration is presented herewith of a new portable heater or stove manufactured by F. D. Woodruff, 142 Michigan street, Chicago, who is also the inventor and patentee. The heater has many new features. Its name indicates the leading principles of its construction, the word "grate" referring to its fire place effect and "spiral" to the auxiliary heating drum. It is designed for the use of hard coal or coke, but its construction is peculiarly favorable to the use of gas or oil gas.

The fire pot in this heater is low down, being closely modeled from an open fire place, and is supplied with a shaking grate which will not clog. This fire pot extends back into the open court of the heater and is supplied with cold air on all sides. In the open court of the heater a magazine is placed, and the gradual feeding of the fuel to the fire pot gives the pleasing effect of a constantly glowing fire. The fire place has a mica front with the mica so ingeniously fastened to the frame that it shows neither joints nor fastening and it can be readily cleaned on the inside. The mica front allows perfect control of the fire by dampers and prevents the escape of dust or gases. By removing the mica front and opening the direct draft damper an open ventilating fire is secured, but the heating power is then much reduced.

Passing to the drum, the figures and arrows on the illustration represent the several parts and the course of the products of combustion. From the grate the

products of combustion pass to the first or lower flue of the heating drum, which may be said to be independent of the fire place. This is a double sheet iron drum with a space of  $2\frac{1}{2}$  inches between the two drum casings. Spiral floors are placed between the two drum casings forming spiral flues  $2\frac{1}{2}$  x 10 inches. A flat flue like this will radiate more heat than either a square or round flue of the same capacity. From the throat of the fire place (second arrow) the course of the first flue is spiral downward to the opposite side of the fire place, where the spiral floor is cut short, allowing the draft to return over itself, and from this point on is a continual spiral course upward, the products of combustion entering the stove pipe through dotted lines just above the direct damper B. The length of flue travel is 28 feet in the smallest size. In this heater all the flues are vertical and every inch is therefore radiating surface.

Instead of the cold air passing directly from damper A to the fire, as in ordinary heaters, it passes across

*The Grate-Spiral Heater.*

back of the fire pot and then returns over itself to the front of the ash pan, thus making a double cold air circulation under the ash pan, and, becoming heated on its way to the fire, is an aid to combustion. The claim is made that these heaters will save one-third of the fuel as compared with an ordinary stove. The floor space required for the medium size of this heater is 18 x 36 inches oval, and it is 58 inches high. Other interesting details are fully described in an illustrated circular issued by the manufacturer.

## The Western Stove Company of Canada.

F. J. Taylor, who has been purchasing agent of the Gurney Foundry Company, Limited, Toronto, Canada, for 12 years, resigned his position August 30 for the purpose of entering into the manufacture of stoves and ranges on his own account. He is organizing the Western Stove Company, Limited, with a capital of \$50,000. Associated with him is J. J. Cunningham, formerly mechanical superintendent of the Gurney Foundry Company. They have purchased the plant of the National Iron Works, Wingham, Ontario, and expect to put stoves and ranges on the market this fall. The new company will be pleased to receive from supply manufacturers copies of latest catalogues and best discounts, addressed to them at Wingham.

### Retail Prices of Stoves.

In discussing the trade situation and the question of stove prices this fall, Charles E. Hughson, secretary of the Knapp & Spencer Company, Sioux City, Iowa, is reported by a local paper to have expressed the following views:

Notwithstanding prices are about 10 per cent. higher, our sales have been at least 25 per cent. greater than last year. We have observed also that the demand has been for the very best grade of goods. The principal cause of the advance is that the price of labor is higher. Every year, in April, the stove makers get together and make up a schedule of wages which they ask the manufacturers to sign and the schedule is usually signed without any trouble.

Last April the schedule was made higher and the people are paying the freight. Of course the price of iron and steel has also been advanced and this advance enters into the general increase of prices for hardware as well. The foundries have been very busy, and it has been a very prosperous year both for the manufacturer and the employee.

### Buckwalter Stove Company.

A stove catalogue which gives evidence of having been arranged with careful attention to the requirements of the trade and which reflects great credit upon the compiler is that just issued by the Buckwalter Stove Company, proprietors of the Continental Stove Works, Royersford, Pa. It is a volume of 192 pages, bound in colored paper covers, and is known as Catalogue No. 36. An interesting feature of the early portion of the work is the presentation of excellent likenesses of the officials and representatives of the company arranged in groups upon facing pages. Other features of the opening pages include an announcement to the trade, a *fac-simile* of the guarantee given by the company with every Continental stove or Eclipse furnace that may be purchased, a statement of terms, a telegraphic code, suggestions for ordering repairs and a price-list and classification of castings for repairs.

In the make up of the matter the ranges are first considered, these occupying something like 80 pages of the catalogue. The assortment presented is a varied one, the goods being offered under such names as the Grand, Model, Royal and Magic Apollo ranges, and the Art Canopy, Prize Canopy, Canopy Dawn, Canopy Fair, Canopy Grand, Star Canopy, Candid, Pluck, Ideal Apollo and Home Canopy cook stoves. Among the heaters the leading place is occupied by the Colossus, a full revertible flue base burner, made in four sizes and as a double heater. Following this is the Happy Greeting, also a powerful double heater and circulator, which has been on the market sufficiently long to establish for itself an enviable reputation. Another member of this general class is the Model Ringgold, offered in a number of sizes. Other heating goods include surface burners, oak, air tight, globe, cannon and laundry stoves. Several lines of furnaces are also illustrated and described, as well as ventilating grates and heaters.

The sales agencies of the manufacturers are the Chicago Stove & Range Company, 237 to 245 East Twenty-sixth street, Chicago, Ill., and E. F. Kurtz, 43 North Second street, Philadelphia, Pa. Mr. Kurtz makes announcement among the closing pages of the catalogue that he is prepared to furnish repairs of all kinds for any cook stove, range or heater made in the United States.

### Some Crawford Ranges.

A 12-page folder which is being distributed among the trade by the Walker & Pratt Mfg. Company of Boston, Mass., sets forth the merits of some of the Crawford ranges, which are offered in many styles and sizes. In connection with the Home, Empire and Charm styles of Crawford range the manufacturers use a heat indicator, which shows at a glance the condition of the oven for cooking purposes, and it can also be furnished with the Villa Crawford if desired. The latter range is a new construction, somewhat simpler than some of the others and therefore a little lower in price. The con-

structive features, however, are such as to render it attractive in appearance and satisfactory in operation. The Home Crawford is a representative of the company's highest grade of stove, with full size square oven fitted with two oven racks and triple asbestos oven back. The interior of the oven is treated with aluminum, which renders it light. The oven top is sectional and will not crack, while the bottom of the oven has a removable panel and will not warp. The Empire Crawford, also shown in the folder, is of first quality but a little smaller than the range just described. It is fitted with improved Dockash grate, by means of which the ashes and clinkers are quickly removed. The Charm Crawford is another member of this general class and has proved very popular. It is suitable for families who do not care for so large and costly a range as the Home or the Empire. The constructive features are of a modern type, and a single damper governs all the operations of the range.

### Buck's Steel Ranges

We have received from Buck's Stove & Range Company, St. Louis, Mo., a 56-page supplement to their Catalogue No. 102. The matter relates to Buck's steel range series, which are illustrated in great profusion. The ornamentation combines the judicious use of nickeled parts in combination with the black iron surfaces, producing very striking effects. As the manufacturers put it, "The nickeling is heavy and in the right place." The range body is made of one solid piece, and as all corners are solid there is no chance for warping. The oven is constructed of two pieces of steel braced in the center of the bottom with heavy riveted seam and also by heavy cast frame. It is lap jointed and has a large surface exposed to the heat. The bottom of the oven rests firmly on a rigid flue strip and is claimed to bake and roast evenly throughout. The oven top is made convex and has an extra heavy base to prevent deflection, which also acts as a rest to all key plates. There is a cast shield extending from the fire box, which protects the oven top from hot coals spilled by an overfull fire box. It also prevents the oven from becoming too hot when the damper is down. The flues are lined with heavy asbestos board, which, as is well known, is an excellent nonconductor. The fire box is fitted with hot blast linings, which are referred to as a new departure in range building. The ash pan is large and the other features about Buck's steel ranges are such as to command the careful consideration of an intelligent trade.

The goods shown in the supplemental catalogue are made in sufficient variety to meet all ordinary requirements, and while some of them are intended for burning hard coal or coke as a fuel, others are designed for using soft coal or wood and still others for using wood exclusively. Reference is also made in the catalogue to broilers, water fronts and backs, high closets and high shelves. A sectional view of a steel range is given with the various parts numbered and referring to an explanatory table so as to facilitate the ordering of repairs by the dealer and thus prevent many of the annoying mistakes which are constantly occurring in this branch of business.

Accompanying the catalogue is a base burner supplement to Catalogue No. 102, referring especially to Buck's Radiant base burner for anthracite coal or coke. The heater is a handsome specimen of the stove makers' art, and when in full operation presents a most brilliant effect. The constructive features are of the very latest type, while the ornamentation is dazzling in the extreme. The supplemental catalogue describes the features at length, while the illustrations show the stove mounted and also in various stages of dismantling. The matter is arranged in a very neat and attractive style and reflects much credit upon the compiler.

At Huntington, W. Va., on August 28, the almost new plant of the Huntington Stove & Foundry Company was burned, entailing a loss of nearly \$30,000. It was insured for \$10,000. The fire caught from the foundry cupola.

### New Stove Company.

The Sangamon Mfg. Company, Springfield, Ill., are preparing to occupy the buildings which were constructed for the Patrons Mfg. Company, no longer in existence. The main building is over 600 feet long and the smaller building, which will be used as a foundry, is 80 feet square. The beds for the engines, water pipe connections and other necessary fixtures are already in the buildings and the installation of machinery began on September 1. Additional machinery will be purchased later. The Sangamon Company will manufacture mining cars, mining tools and stoves. Considerable business for mining cars and mining machinery has been offered, but thus far the company have refused all orders, but expect soon to be in a condition to accept some of the contracts. The directors of the company are as follows: Thomas White, president; L. K. Davis, secretary and treasurer; W. A. Colvin, secretary Board of Directors; Irving Barker, Harmon Brown, Frank P. Dooling, John Ettelbrick, R. A. Higgins, N. R. Johnson, W. A. McCullough, Edward Ready.

### The Larson Oil Burner.

The Economic Burner Company, 968 Broadway, Oakland, Cal., are manufacturing the Larson oil burner, which is designed to use the lowest grade of distillate or high gravity crude oil for operating furnaces, boilers, family ranges or stoves. The burner is stated to be totally different from anything previously brought out in this line. It converts the oil gas while in operation and requires no labor or trouble. The burner is started by simply opening a valve about one-fourth of a turn, allowing the oil to flow in the burner and applying a match. In less than five minutes the gases generate and the burner is operating, the power of the flame being easily regulated. A feature of the burner is the fact that it can be taken apart, readjusted and replaced in less than ten minutes. It is stated that 1 gallon of distillate will burn from four to five hours in a small cook stove or range, heating the entire stove and water back and producing a perfectly even heat. Four sizes are manufactured, which present a sufficient range of heating power for all purposes. The company have issued an illustrated circular giving views of numerous dwellings, churches, office buildings and public institutions heated by oil through the use of this burner. J. E. Larson is the inventor and patentee.

### The Cleveland Gas Range with Reservoir.

The Cleveland Steel Range Company, Cleveland, Ohio, have issued a circular illustrating their Gem Ideal and Grand Ideal gas ranges. These ranges present a new feature, consisting of the addition of a reservoir to secure a supply of hot water. This reservoir is constructed of polished copper and is placed over special burners arranged in a bracket at the side of the range. These are large and powerful burners and are directly underneath the tank, ready for operation whenever desired. The reservoir may be removed and the range can then be converted into a full six-hole top. These ranges may also be converted into water heater ranges and connected to a circulating boiler by the use of water coils furnished by the company. In the construction of the reservoirs the best 14-ounce cold rolled copper is used. The reservoirs have a high nickel plate finish with enameled cast tops.

### The Acme Oil Burner.

The Acme Stove & Light Company, 59 Fulton street, New York, is the title of a newly incorporated company, with an authorized capital of \$500,000, organized to manufacture and handle the patented Acme burner for general heating purposes in domestic use. The burner is the invention of F. B. Ferguson of Brooklyn, N. Y., who is the vice-president of the company. The other officers are W. S. Estey, president, and E. R. Brush, treasurer. The Acme burner is designed for burning kerosene oil as fuel, and it can be set directly

in a grate without making any changes. The operation is claimed to be so simple that it can be used with safety by the average domestic. It can be applied alike to cooking ranges and heaters. The manufacturers state that a complete heat is obtained in from three to five minutes after lighting, and that once started all the heat is retained, a pure, odorless gas being produced. Any clean screened oil can be used in the apparatus. Experiments made with California oil are said to have been so successful that the company have received a number of orders for the burner from the Pacific Coast. They are now ready to supply the burners in a limited way, but will shortly increase their capacity of production.

### ODD PLATES.

THE MARCH-BROWNBACK STOVE COMPANY, Pottstown, Pa., are favoring their friends in the trade with a poster calendar for the closing months of the year, beginning with September. It is bound at the top with a metal strip, and is arranged with a loop so that the dealer can hang it in a conspicuous place in his store. The upper part of the poster carries a general view of the Crown Low Down Furnace, the outer casing being removed so as to show the internal construction as well as the passage for some of the air currents. The leaves carrying the figures of the days and weeks are printed in white on a ground work of olive green, and give, in addition, the various phases of the moon. A sheet is also provided giving a calendar for the 12 months of 1903.

WILLIAM J. H. GLUCK, Baltimore, Md., sends us a package of circulars relating to some of the many specialties with which he is prepared to furnish the trade. Among the advertising matter is a circular of the Gluck Four-Hole Cook Stove, which is referred to as "the culmination of 25 years' experience; every feature that concerns the art of cookery has been investigated; every principle involved in the theory of drafts, juxtaposition of flues, size of fire box, shape of oven and the laws of heat and air, has been thoroughly examined and appropriated." Still other claims are made for the Stove, which in appearance is neat and attractive. Reference is also made to the Gluck Oil Heater, which has a new style of bail serving as a support for the cylinder when tilted, while at the same time the shape of the ball keeps it from the body of the Stove and prevents it from becoming hot. Gluck's Steam Cooker, a line of Hot Plates and a varied assortment of Tinware and miscellaneous goods are also referred to.

LOU BAKER of the Portsmouth Stove & Range Company, Portsmouth, Ohio, has just returned after an absence of several weeks on the road in the interests of his company, whose motto is "The Busiest Stove and Range Makers on Earth." Mr. Baker reports business conditions as being all that could be desired. His company are receiving all the orders they can possibly take care of, the only difficulty just now being the prevailing one of inability to secure supplies of materials that enter into the production of their output.

At the annual meeting of the stockholders of the Pittsburgh Stove & Range Company, held in the offices of the company, Allegheny, Pa., on Monday, September 1, the following directors were elected for the ensuing year: John B. Nicholson, Charles H. Bradley, George W. J. Bissell, James F. McKee, W. S. Huntley, A. M. Nepper and John S. Graham. The board will elect officers this week.

THE RICHMOND PATTERN WORKS, Richmond, Va., of which C. M. Liphart is the proprietor, will be extended by the addition of another floor. The product of this plant includes Patterns of all kinds in wood and metal, particular attention being given to the designing and construction of Stove Patterns.

ON account of the rush of business and the bright future, and to obviate the necessity of operating at night, the S. Obermayer Company of Cincinnati, Chicago and Pittsburgh, manufacturers of Foundry Facings, Supplies and Equipments, have let contracts for an additional factory building to the Cincinnati plant.

The extra addition will be a three-story brick building 60 x 90 feet, and will increase the capacity of the Cincinnati plant about 33 1-3 per cent. The general offices of this company are at Cincinnati, Ohio.

GEORGE M. CLARK & Co., Chicago, manufacturers of Jewel Gas and Gasoline Stoves and Steel Ranges, are favoring the trade with a series of artistic cards calling special attention to their line of coal and wood Steel Ranges. We have received a set of five of these cards. They differ in color, design and printed matter, and are of such an original character in every respect that they can hardly fail to claim attention. Each card is surrounded with an engraved border printed in separate colors from those forming the body of the card. The printed matter is cleverly conceived, being necessarily brief but striking.

THE MICHIGAN STOVE COMPANY, Detroit and Chicago, favor us with a specimen of the blotters which are being sent to their agents for advertising purposes. Very appropriately the blotter requests those who receive it not "to blot" from their memories the fact that Garland Stoves and Ranges cook food and warm homes for millions.

THE PITTSBURGH STOVE & RANGE COMPANY, Pittsburgh, Pa., are bringing out a soft coal Range and a new Heating Stove designed to burn soft coal without producing any smoke. Details regarding these new constructions will shortly be ready for the information of the trade.

THE CHICAGO FURNACE SUPPLY COMPANY, Chicago, have added 1700 square feet of floor space to their factory at 68 to 70 West Monroe street and have installed additional machinery for the manufacture of Stove Pipe and Stove Pipe Elbows. They are now manufacturing two lines of Wall Pipe, one in sections and the other in long lengths, with or without slips. A new illustrated catalogue has recently been issued describing the Furnace Pipe and Fittings, Registers, &c., manufactured by this company.

THE B. C. BIBB STOVE WORKS, Baltimore, Md., are offering an interesting assortment of specialties for the season's trade and look for a very gratifying volume of business. Among their leaders may be mentioned the Arcadian, a six-hole Range of attractive exterior and embodying the modern features. Nickel is judiciously employed in the ornamentation and contrasting sharply with the black iron surface makes a very attractive showing. The company manufacture, in addition to a large assortment of Stoves, Ranges, &c., an extensive line of Fire Place Heaters, which have established an enviable reputation.

DANIEL PRINTZ is now president of the Reading Stove Works, Orr, Painter & Co., Reading, Pa. Last week at a special meeting of the Board of Directors President Harry Orr and Directors Jesse Posey and Charles H. Williamson resigned. Daniel Printz and Charles Bren-eiser were elected to fill the vacancies. Mr. Printz was elected president and at once assumed charge. He is now holding a similar position with the Reading Wood & Pulley Company. Mr. Orr remains on the Board of Directors and on the Executive Committee.

THE Stove plant of F. & L. Kahn Bros. & Co., Hamilton, Ohio, will be enlarged in the near future by the addition of a brick building, 224 x 248 feet, which will be added to the foundry proper and employ over 350 molders.

THE stockholders of the Home Stove Company, formerly at Greenfield, now at Indianapolis, Ind., are having serious differences. The Indianapolis News states that Louis Hitzelberger, George Vondersaar and Frederick H. Winters, minority stockholders, have applied to the Superior Court to appoint a receiver for the company. George Alig, Sr., who controls the stock, and George Alig, Jr., and Herman R. Frauer are made defendants. The charge is made that, although the company's operations have been profitable for several years, the stockholders receive no dividends and the complain-

ants are given no opportunity to see the books. It is asserted that the defendants are trying to freeze out the minority stockholders.

### L. & G. Ash Cans.

We present herewith an illustration of one of the new galvanized iron ash cans manufactured by the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York. These cans are made of heavy galvanized sheet steel, and are designed for withstanding hard usage, being strengthened with wood staves firmly riveted to the body of the can. It is corrugated in the center to add to its stiffness, and has a heavy rim riveted around the top,

L. & G. Ash Can.

with heavy inserted bottom also riveted to the body of the can. These cans are made with side handles, and are guaranteed to stand a maximum of hard wear without damage. They are made in four sizes, with diameters of 15, 17, 18 and 20 inches respectively, all being 26 inches in depth. The cans are supplied either with or without covers. Galvanized covers with handles are made to fit each size of can.

### Frink's Reflectors.

That good stock needs good lighting is a truth realized this season as never before by the leading merchants throughout the country, as evidenced by their orders for reflectors to the well-known house of I. P. Frink, 551 Pearl street, New York. Among the many contracts for Frink's special patent window reflector and showcase lighting in hand, or recently filled, we are advised of the following: Gimbel Bros., Philadelphia, also their Milwaukee store; Siegel-Cooper Company, New York City; Bloomingdale Brothers, New York City; the large new buildings of Saks & Co., and R. H. Macy & Co., New York City, two stores which because of their location have attracted general attention; the Washington Arcade, Detroit; the Kennedy Furniture Company, Butte, Mont.; the Derby Desk Company, Boston; L. Hammill & Co., Mobile, Ala., who have one of the finest store buildings in the South; J. N. Mockett, Toledo, O.; Hannifin Dry Goods Company, Milwaukee, Wis., and "The Leader," Minneapolis, Minn.

In addition to their special line of reflectors for window and case lighting this concern manufacture a full line of cluster reflectors, mirror shades, &c. The former are well adapted to the lighting of store interiors, being preferred by many to the inclosed arc. The Wadleigh High School, New York City, about completed, has some 800 Frink clusters, which are the standard type of

the New York Board of Education. The additional fixtures in this building, consisting of ceiling coronas with bent glass domes and arch reflectors, were all furnished by this firm. Their catalogue, which fully illustrates and describes their fixtures, will be sent those interested on request.

### The Armstrong Fastener and Seal.

This device consists of a hinged strip attached to lid of the pail, as shown in the cut, with an ingenious fastening through which is passed a lead and wire seal, similar to those used on freight cars. It is designed for sealing oyster, fish and similar returnable pails. The seal is put on by the shipper, the record is taken by the carrier, and if the package arrives at its destination with the seal unbroken, any question of shortage obviously lies between the shipper and the purchaser. If the seal has been broken the shortage can be definitely placed on the carrier. By impressing different numbers

*The Armstrong Fastener and Seal.*

on the lead seals at division points en route, express companies can locate the point where breakage occurred, thus protecting their interests. The Armstrong Fastener & Seal Company, 207 Sixth avenue, Des Moines, Iowa, are offering the fastener and seal.

### Hall's Peerless Mincer.

The Troy Nickel Works, Albany, N. Y., are offering the food chopper shown in the accompanying cuts. The clamp is separate from the body and can be clamped on

*Fig. 1.—Hall's Peerless Mincer.*

a shelf or table to remain permanently if desired. The body at any time can be quickly attached to the clamp, and can be placed in four different positions over the

shelf or table, or reversed when a pail, jar or barrel may be placed to receive the product after being minced. The crank revolves horizontally with the shelf or table to which the mincer is fastened, doing away, it is remarked, with the necessity of stooping, which is tiresome. The mincer is added to as neat, as everything put in the hopper must pass down through the knives

*Fig. 2.—Parts of Hall's Mincer.*

and through one outlet into the receptacle, avoiding the leakage of fruit juices or other liquid. It is explained that the construction of the mincer is such that it is easily taken apart and put together when occasion requires, that it is easily and quickly cleaned after use, that satisfactory results in mincing are secured with little force, that the knives are of hardened steel and all the parts so adjusted that there is the least possible wear. It is stated that the mincer will cut (not mash) into clean cubes anything that is usually chopped in a chopping bowl. Among the articles that it will mince the following are mentioned: All kinds of raw or cooked meats, codfish, clams, figs, raisins, peppers, apples, tomatoes, grapes, peanuts, nuts, corn, bread and crackers.

### Simplex, Pendulum Model, Time Recorder.

The new model Simplex recorder, manufactured by the Simplex Time Recorder Company, Incorporated, of Gardner, Mass., provides a most satisfactory system of keeping the time of employees. In order to register it

*Simplex, Pendulum Model, Time Recorder.*

is only necessary to push a button bearing the number of the employee. The construction is such that every button is locked, except the one in use, thereby preventing one person registering for another without a separate ring of the alarm gong. This recorder requires no keys, cards, ink ribbon, type wheels or "in" and "out" levers, and will handle 100 men in one minute. It is made in three sizes, for 30, 50 and 100 men, the largest size taking a wall space 15 x 42 inches. The clock is a Seth Thomas, 15 day, pendulum movement.

MONTANA HARDWARE COMPANY, Butte, Mont., have recently bought out the Hardware and House Furnishing department of the Bee Hive in that city. For the better accommodation of their large and extended business they are erecting a new store with a warehouse which will be exceptionally complete and admirably arranged.

## Modern Enameling Plants and the Manufacture of Enameled Specialties.

BY J. VOLLKOMMER, PITTSBURGH.

In speaking of the enameling industries we generally associate with this term either the manufacture of white enameled cast iron sanitary and other hollow ware, or of enameled household articles consisting of stamped sheet metal. Yet there are large enameling concerns in Europe (and lately also in this country) doing a thriving business, not as parts of foundries or sheet metal stamping works, but independently by enameling for the trades in general and by manufacturing certain enameled specialties.

The usefulness of enamel is by no means restricted to kitchen ware and bathtubs. Its preservative qualities and intensity of coloring make it a most suitable medium for the manufacture of advertising and street signs. Enameled iron linings for refrigerators, insulated conduits for electric work, the enameling of steel wash boards, of stoves and ranges, of clock and watch dials and of hundreds of other articles keep such plants busy.

Enameling works of this character differ slightly in equipment from plants manufacturing enameled stamped ware or cast iron sanitary articles. As a rule a greater variety of enamels is required, but less quantity. Hence we find, aside of the typical tank furnaces, also one or more crucible furnaces with from four to twelve pots, which are manipulated by a pair of horizontal tongs connected by a hoist to an overhead trolley, the same way as those in glass houses.

### PREPARING THE ENAMELS.

The molten enamel is either poured into water and upon contact with the same granulated to a coarse sand, or it is cooled slowly upon slabs of cast iron or stone. In the latter case the lumps have to be crushed into small fragments before milling them. For this latter operation we generally find three different types of mills in use—namely, the ordinary buhrstone mill, for grinding in water, with oak skirting and a large bottom stone upon which on a vertical shaft several buhrstone runners on driving arms rotate; the vertical or horizontal mills for dry grinding, each with two circular mill stones incased in an iron frame with hopper and rotating at a high speed, and, as the third type, the porcelain lined pulverizing cylinders, for either wet or dry grinding. The charge is fed into the porcelain lined cylinder, which contains a number of flint pebbles, and the rotary motion grinds the enamel between the flint stones and the lining of the cylinder. The crushers employed are usually of the rotary type.

The raw materials for enamels used in sign work are the same as those described in a former article in connection with the manufacture of enameled stamped ware; but owing to a comparatively greater amount of fluxes they melt at lower temperatures. Although their composition varies they all contain a rather high percentage of borax and alkalies in the form of soda, &c., and frequently oxide of lead in the form of litharge, or red lead (minium). The latter imparts to enamel colors a peculiar luster, besides which it also acts as a flux. The use of white lead, especially as a cheap substitute for the more expensive oxide of tin, is not permissible on account of the danger of lead poisoning connected with it for those handling such enamels.

### TOOLS AND MATERIALS.

Enamels intended for dry application are fused in pots and cast on slabs to cool slowly, thus retaining a greater elasticity. They are then broken to pieces. After thoroughly cleaning these lumps they pass through a crusher and then through mills with a bolting attachment containing about 2000 meshes to the square inch. The resulting enamel powder is washed in a weak solution of muriatic acid until the last traces of foreign matter, especially that of a metallic origin, have disappeared and the solution remains perfectly clear and transparent. It should then be dried slowly

in flat wooden or enameled vessels and kept ready for use.

The necessary machine tools for sign work are few. A power shear for cutting plates up to  $\frac{1}{4}$  inch thick, shears—probably of the roller or rotary pattern—for circular or curved cuts, a stamping press, lathe and blacksmith tools comprise the entire outfit. The most suitable material for signs is a high grade charcoal sheet iron, and next to it cold rolled open hearth steel plates or sheets. The thickness of the metal is proportional to the size of the sign and varies between No. 7 and No. 16 U. S. gauge.

### ANNEALING.

After cutting the plates to the desired size and form they are dipped into a solution of equal parts of muriatic acid and water and then placed in the annealing furnace to be gradually heated until of a dark red color, when they are removed to make room for a second lot. After cooling slowly, the scaly oxide covering the surface is removed by brushing and scraping and the plate is straightened, punched—if holes are desired—and slightly raised in the center. For this last operation on large numbers of plates of the same size cast iron forms will be found convenient. A slightly convex surface prevents signs from warping and imparts to them a plastic appearance.

Since the substitution of open hearth and Bessemer steel sheets for wrought iron plates many an enameler has experienced great trouble in obtaining unblemished enameled surfaces. Streaks of a dull roughness and groups of blisters appear at various places. At others the enamel chips or cracks after cooling. The cause of such irregularities is often wrongly ascribed to the composition of the enamel, to imperfect pickling or to a bad muffle furnace; whereas the fault frequently lies in the difference in the structure of sheet steel from wrought iron. The surface of the steel often contains impurities which the ordinary processes of pickling do not always remove. Minute cavities filled with gaseous matter expand during the process of firing, while the escaping gas bubbles force their way to the semi-liquid enameled surface, forming either blisters or, by bursting, a rough crust. To overcome such difficulties the following treatment of faulty steel plates has given good results in some German enameling works: Dip the plates into a solution of 1 part of calcic chloride to 2 or 3 parts of water and then, while yet wet, place them in an airtight annealing furnace for one hour or longer. Or dip the articles into the same solution, then dust over their wet surface pulverized sulphur and anneal them in an airtight case in an ordinary furnace, or, without casing, in a tight closing annealing furnace, until uniformly dark red. In either case the fumes of the evaporating chemicals destroy the surface of the steel, thus permitting the escape of any gases beneath. The roughened surfaces of the steel plates now form an excellent recipient for the enamel.

### PICKLING.

To insure a perfect surface for the reception of the enamel the plates are now pickled. The following two methods are among those to be found in present use: Submerge the articles in a bath of 20 parts of water with 1 part of sulphuric acid for about 12 hours and then rinse in clear water and scrub them clean. Or, use a solution consisting of 20 parts of water, 3 parts of nitric and 1 part of sulphuric acid. In mixing, pour each acid into the water slowly and in successive order; never both at the same time, since an explosion might be the result. After an exposure of from 20 to 40 minutes remove the plates from the pickling tank, clean their surface thoroughly, and dip them into boiling water containing a weak solution of soda, to remove the last traces of acid. The plates are now ready for the first coat of enamel.

### ENAMELING.

Signs are enameled either by applying the enamel in a liquid form (wet process) or by dusting the finely ground enamel powder over their surface (dry process). The first method has been described at length in a previous article. It consists in dipping the slightly moistened metal plates into a vessel containing liquid enamel.

Tongs of spring steel having three arms with saw-tooth ends are used to hold the plates firmly during this operation. To large signs the enamel is also applied by pouring it over their surface while in an inclined position or by brush and lately by pneumatic spray. The brushes used for this purpose are similar to broad paint brushes and of long and fine hair. Care must be taken to brush the enamel evenly and in one direction only. The spray or vaporizing apparatus shown in Fig. 1 consists of a

Modern Enameling Plants.—Fig. 1.—Enamel Spray.

cylinder or drum connected with an air compressor, or charged with a certain amount of highly compressed air. By means of rubber tubing this air is forced into one or more large vessels containing liquid enamel. A second tube from the same vessel sprays the enamel over the desired article. It is directed by hand and has at its end an adjustable nozzle. The air drum is fitted with a valve indicating the pressure and with means of regulating the same at will. The air pressure varies according to the size and construction of the spray and the consistency of the enamel.

#### DRYING ROOM.

The newly coated, moist steel plates are now placed in the drying room, where owing to a temperature of about 160 degrees all moisture soon evaporates. In conveying them care should be taken that the surface containing the fresh enamel should not come in contact with

Fig. 2.—Circular Drying Shelf.

anything except the supports upon which they rest. In contrast with the old construction of only stationary shelves along the sides and across the chamber, drying rooms with fixed and rotary shelves at present find

much favor. These latter consist of a number of shelves fastened radially above each other to a vertical center-shaft with pivot bearings, revolving at the slightest touch. These several shelves may be of circular form, as shown in Fig. 2, or square or of any polygonal form. They are laden with ware by turning the rack. Considerable room can be saved by placing these racks in rows in the middle of the drying room, extending through its entire length, one opposite to each door, thus leaving the entire floor space available for heating surface. The corners and the spaces between the doors can be utilized for stationary shelves. Rotary racks permit an easy and rapid inspection of the ware without handling it.

A sketch and detailed description of muffle furnaces, similar to those in use for sign work, has been given in

Fig. 3.—Tee Iron Stand.

Fig. 4.—Cast Iron Stand with Steel Points.

a former number of this paper. The grades and carriages (forks) employed to serve the muffles are of the same type as those used in the manufacture of kitchen ware, while in the muffle the signs rest on the sharp edges or points of stands, having, however, as little con-

Fig. 5.—Angle Iron Stand for Plates Enamelled on Both Sides.

tact as possible with them. Examples of these stands are shown in Figs. 3, 4 and 5 of the accompanying illustration.

#### STENCILING.

The enamel intended for the last coat should possess some adhesive qualities. Therefore dissolved gum arabic or some other vegetable sticky substance is added. The lettering on ordinary signs is produced by means of stencils. Blue signs with white (sunk) letters are made by applying the last (blue) coat on top of the previously burned second (white) coat. As soon as the latter is dry a stencil, on which the lettering and other matter to appear afterward in white has been cut out, is fastened securely by means of clamps and frame over the sign and then brushed out until only the white second coat remains visible through the perforations of the stencil. The latter is now removed and the sign retouched—that is, the stays between the letters and other superfluous enamel is scraped away with sharp pointed sticks of box wood. The same principle applies to white signs with blue raised letters, excepting that a stencil of the opposite character (positive stencil) is used. That is, lettering and ornamentation remain, but everything adjoining is removed, leaving only sufficient material for the stays or strips uniting the letters with the balance of the sign. A less expensive sign, also containing dark blue sunk letters on a white ground, is made by applying on top of a dark blue ground a very opaque white, which is brushed out, using an ordinary stencil, the same as on a blue sign with white lettering.

A method much in use in German factories consists in writing, either by hand or stencil, upon the properly enameled background with a mixture of lard, beeswax and copal or some other lacquer. The entire surface is then coated with enamel and the sign placed in a special muffle exposed to a considerable heat, but below fusing temperature. As a result all enamel adhering to the

prepared surface will break away, exposing the lettering. After some retouching the sign is ready for its final fire. In stenciling signs hand work can be partly superseded by using rotary brushes driven by compressed air. The signs are placed on revolving stands and the brushes guided by hand.

STENCILS.

The best and least expensive material for stencils is a tough, flexible paper of the type of the heavier and better grades of yellow drawing papers. Its surface must not get rough, show fibrous fringes, or peel off on account of the friction produced by rubbing. To insure durability and resistance against moisture this paper is treated with a solution of beeswax in hot turpentine; or, better, varnished with shellac dissolved in alcohol. The letters must be cut sharp and exact. The stays connecting them should be judiciously distributed so as to prevent the several parts of the stencil from tearing without, however, making them too prominent and thus necessitating more retouching on the sign. In special cases stencils of thin brass sheets and occasionally of heavy tin foil or sheet lead are employed. Where many stencils of the same kind are required blue printing is resorted to. The original sketch is made in black and white on semi-transparent paper and printed on suitable paper containing blue print solution. Before cutting out the lettering it receives a coat of varnish. For street signs, house numbers, and work requiring large, plain lettering, separate metal stencils for each letter or figure may be used. They are set into adjustable frames by means of slides and firmly clamped together, enabling any combination of letters or figures to be made without requiring a new stencil for each case.

POWDERED ENAMELS.

Powdered enamels are little used for ground coats on sheet steel, but more for the final operations on sign work. After sponging the surface with some adhesive matter, such as gum arabic, glue or a decoction of sea moss (*Jucus crispus*), the enamel is sifted over the metallic surface and burned in or fused as soon as it is dry. The next layers are applied in the same manner. For ordinary work the letters can be stenciled or even printed upon the surface forming their background, using a specially prepared printer's oil, some heavy, slowly evaporating varnish, or a mixture of thick oil and turpentine as a medium upon which the enamel is to be sifted. Great care must be taken to remove all superfluous enamel and to clean the signs thoroughly before firing.

A high grade sign is produced by stenciling or tracing the lettering upon the background and then applying the enamel in the following manner: Sift enamel of the desired color through a silk bolting cloth and mix the dust derived therefrom with a mixture of colophonium dissolved in turpentine until it is of a pasty condition and will just permit its application by brush. Fill in all lettering and ornamentation with this paste, and dry the sign well. It is then fired, after having been thoroughly cleaned with soft rubber, removing especially the brownish stains caused by the adhesive. The lettering on such signs projects in relief. For such work the colored enamels must be specially melted and not prepared by simply mixing the desired coloring oxide with the white enamel. Shading and hand decorations require a special fire. The prepared oxide or colored glaze and some soft flux are thoroughly mixed with thick oil (concentrated turpentine) and ground upon a glass plate to a semiliquid paste. The colors are applied in thin layers the same way as in china decorating. They are burned in at a dark red heat. For gilding, the so-called liquid gold is obtained ready prepared. Liquid silver and platinum permit other metallic effects. These preparations are carefully applied with fine long haired pencils. They are then dried and fired in muffles at a dark red heat technically known as gold fire.

VENTILATION.

Enameling shops, especially those sections where signs are stenciled or brushed out, also where pulverized enamels are applied, require a well planned system of ventilation. For this purpose a large, inclosed suction

fan of the centrifugal type can be installed, into which the several sheet metal ventilation ducts drain. Large suction inlets, preferably covered with wire screens, should be provided at various heights, and as close as possible to the places where signs are handled. These will carry off most of the injurious enamel dust and thus prevent its inhalation. The outlet containing the fan should be so constructed that the floating enamel dust is precipitated and thus can be used over again.

PRINTING AND DECALCOMANIA DECORATION.

A printing outfit will be found a very well paying investment in sign works. The printing is done by means of engraved plates of steel, copper, zinc or aluminum, or lithographic stones. There are two styles of presses in use. The press with one or two fixed rollers and sliding table, and the two-roller press, or roller printing machine. In the first case, single sheets are printed from single engraved plates. In the latter, the surface of the lower roller contains the engraving, from which endless rolls of paper are printed. A continuous jet of steam passes through this roller, to prevent the oil and color from hardening. The printing is done upon English printing paper and a special printing oil is employed for mixing the colors. For polychrome prints, each color requires a special plate.

In transferring, the prints or decalcomanias are slightly moistened, spread upon the sign, completely flattened out with rubber rollers and then varnished. Before firing they are exposed to a very low heat in a special muffle to evaporate all oil. They are finally burned at a dark red heat. The printing paper should completely incinerate without leaving any traces excepting the design. Photographs can be transferred upon enameled metal surfaces in the same manner as it is done in the ceramic industries.

The application of the sand blast or a bath in diluted hydrofluoric acid destroys the glossy surface of enameled plates. This fact is taken advantage of in the manufacture of metallic blackboards and writing tablets.

RECIPES FOR ENAMELS.

Composition of enamels for wet applications, suitable for sign work:

| Ground (Dark Blue).      |             |                                                                                                                                                                                                             |
|--------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | Parts.      |                                                                                                                                                                                                             |
| Borax .....              | 33          | To 100 parts of enamel, add 6 to 9 parts of clay at mill.                                                                                                                                                   |
| Quartz .....             | 20          |                                                                                                                                                                                                             |
| Felspar .....            | 28          |                                                                                                                                                                                                             |
| Calc spar, or chalk..... | 9           |                                                                                                                                                                                                             |

| Blue.                    |             |                                                                                                                                                                                                             |
|                          | Parts.      |                                                                                                                                                                                                             |
| Borax .....              | 32          | To 100 parts of enamel, add 2 parts of clay, white or yellow clay, according to the desired shade of the blue. By adding a small amount of oxide of manganese or nickel, the color can be slightly changed. |
| Quartz .....             | 17          |                                                                                                                                                                                                             |
| Felspar .....            | 31          |                                                                                                                                                                                                             |
| Soda .....               | 5           |                                                                                                                                                                                                             |
| Fluorspar .....          | 8           |                                                                                                                                                                                                             |
| Saltpeter .....          | 3           |                                                                                                                                                                                                             |
| Cryolite .....           | 2           |                                                                                                                                                                                                             |
| Oxide of cobalt.....     | 2           |                                                                                                                                                                                                             |

The above few recipes are not supposed to give equally good results under all conditions. They are merely intended as a general guide to the enameler, who will modify them to suit the particular conditions existing in his shop and the composition of his raw materials.

#### ENAMELED SPECIALTIES OF COPPER, WATCH DIALS AND FACE PLATES.

The disks of the desired size are punched out of copper sheets, centered, and after drilling all small holes, turned on lathes in numbers of a dozen or more to the exact size. A slightly convex shape is given them by means of a hand press and the proper metal dies. The riveting of the metal pins and countersinking them on the face side forms the next operation. Pickling is dispensed with, provided the articles are free from dirt and grease. In fact, the natural, reddish brown coat of oxide covering the copper serves as a very good recipient for the enamel. The latter is applied as follows: Dissolve several ounces of good glue in about two quarts of water and mix and grind it with the finely pulver-

veloped very strongly, since they fade considerably in the low muffle fire to which they are exposed.

Copper letters and signs are enameled the same way as dials, but receive one coat of enamel and on one side only. The enamel paste for wet application consists of such inexpensive materials as white fluorspar, gypsum or plaster of Paris, and a small percentage of borax. A somewhat better enamel, containing some oxide of lead and considerable borax, is dusted over the wet enamel.

#### Sheet Metal Interior Decoration.

We present herewith some samples of the stamped sheet metal ceilings and side walls manufactured by the Brooklyn Metal Ceiling Company, 283-287 Greene avenue, Brooklyn, N. Y. The company have been engaged for some time in the manufacture and perfection of stamped sheet steel for interior decoration and have achieved a marked success in this field. The examples

Fig. 1.—Side Wall Plate, Diaper Design.

Fig. 2.—Ceiling Panel, Grape Vine Pattern.

Fig. 3.—A Frieze, Animal Life.

#### SHEET METAL INTERIOR DECORATION.

ized enamel powder until the mass has the consistency of thick syrup. Brush this paste on the copper disks and sift pure white enamel powder over the yet wet surface. The back of dials can be covered with a coat of inferior enamel, for which purpose remnants and spoiled melts can be utilized. It is not powdered over with dry enamel.

For burning, the disks are placed upon narrow, slatted, iron grates, coated on top with pipe clay or slaked lime to prevent the melting enamel from sticking. After an exposure to the muffle heat of from two to three minutes the enamel should have fused and formed a smooth, glossy surface. The articles are now removed to make room for the next lot. The dial plates thus enameled should be carefully inspected and all blisters and impurities removed by grinding them off or by filing. The second coat of enamel is now applied to the face side in the same way and burned. Enamel for face plates and dial work should fuse at about 1600 degrees F., or 870 to 900 degrees C. The printing on the dial faces is done by means of lithographs, which are transferred and burned in the usual manner. Photographs for transferring purposes must be de-

given herewith afford a good idea of the class of work that is being done by this concern, and also of the ornamental possibilities offered by their products. In Fig. 1 is shown a side wall plate of diaper design. These sheets are made 23 inches wide and 5, 6, 7, 8 and 9 feet long. They form extremely attractive and artistic wall coverings for almost any class of buildings. The ceiling panel given in Fig. 2 is of grape vine pattern, peculiarly adapted for dining rooms or places of public refreshment. These plates are made 19 inches square. An unusually attractive design is shown in Fig. 3, which represents an artistic frieze 11 inches wide stamped with a realistic scene of animal life in the forest. The manufacturers report that they have a large and increasing demand for their goods in this line.

BERTSCH & Co., Cambridge City, Ind., manufacturers of Shears, Punches and Bending Rolls, contemplate the removal of their plant to some other location, their present facilities having become entirely inadequate to accommodate their growing business. Although several propositions are under consideration the company have as yet made no decision as to their future location.

## The Empire Iron & Steel Company.

The product of the new plant of the Empire Iron & Steel Company, at Niles, Ohio, will be sheet steel and angles for light structural work. The plant will contain six hot mills, two cold mills and a three-high 24-inch bar mill. Iron and steel sheets will be made up to 60 inches wide and from 16 to 30 gauge. Specialties will be guaranteed double refined iron sheets, range steel and Bow-socket polished sheets. The output of iron and steel angles will be about 100 tons per day, and for the present the heaviest angles the company will roll will be 4 x 4 inch. They expect to start their plant about October 1, but the galvanizing plant, which is being erected, will not be ready for operation before about January 1. The company have effected an organization by electing Wade A. Taylor president and treasurer, Charles S. Thomas, vice-president and manager, and J. F. O'Dea, secretary.

## "M. F." Brand Tin Roofing.

An interesting discussion recently arose as to the origin of the "M. F." brand of roofing tin, which is being put on the market by the American Tin Plate Company, and of which W. C. Cronmeyer, Carnegie Building, Pittsburgh, is special agent. The supposition was that the letters "M. F." stood for "Most Favored," but in order to remove any doubt in the matter Mr. Cronmeyer addressed a letter to Margam & Mansel Tin Plate Works, Port Talbot, Glamorganshire, England, making inquiries as to the origin of this brand. In reply Mr. Cronmeyer received a letter from Sydney H. Byass, a copy of which we have been able to secure and which reads as follows:

"In reply to your favor of the 17th inst., I thank you for sending me one of your new booklets, and with regard to the origin of the letters 'M. F.' I do not think that any of the theories which have been advanced to you are correct, but as a matter of fact the letters stand for 'Margam Forge.' I have not been able to absolutely make certain that this is the case, but it is more than probable that this is the correct solution, as at these works the brand was first made, and in fact was made here until four or five years ago, when the works were dismantled. They are still known by the name of 'M. F.' among the old workmen."

The process under which the "M. F." brand of roofing tin is made has proved to be successful in producing a roofing tin of lasting qualities. Since being acquired by the American Tin Plate Company the process has been considerably improved. We may state that the U. S. Eagle brand of roofing tin, made by the United States Iron & Tin Plate Company in this country years ago, was made by the same process as the "M. F." brand. The main improvement in the process made by the American Tin Plate Company was in giving the plates a bath in oily substances horizontally instead of vertically. By this process the common fault of allowing a large part of the coating to adhere to the lower edge of the plate when it is removed vertically from the tinning pot is overcome and the coating is distributed evenly over the entire surface of the sheet.

## A Brass Catalogue.

We have received from the Waterbury Brass Company, 122 to 130 Centre street, New York, a copy of a new catalogue and stock list showing what they carry in stock in their New York warehouses. It consists of a neatly prepared publication of 52 pages, well printed in two colors and illustrated with engravings of some of the goods. On the title page is presented a view of the company's large Centre street warehouse, which gives an idea of the extensive facilities possessed by the company in their new quarters. The statement is made that they have three different telephone numbers, so that if one is busy their customers can call them up on another. They also maintain a private telephone exchange in their warehouse and are in direct telephonic communication with their general offices and mills at Waterbury, Conn. Views are also given of some of the

departments of their New York branch, including the salesmen's office and a portion of the stock room. Among the goods presented are hard and soft sheet brass in rolls, spring brass, spinning copper, hoop brass, soft bronze in rolls, German silver in rolls, brass in sheets, sign brass, sheet copper, German silver and white metal, brass, copper and yellow metal rods, brazed brass tubing, seamless brass and copper tubing, cornice and roofing copper, cold rolled polished copper, soft brazier sheet copper, soldering coppers, brass and bronze moldings, copper and yellow metal nails and sheathing, together with a number of specialties in brass, including curves, stair treads, moldings, seamless brass chisel handle ferrules and screwdriver handle ferrules, sheet brass grommets, hat ventilators and brass eyelets for all purposes and also a full line of brass checks. The company state that they make a specialty of drawing and spinning brass and can supply special widths or circles in brass and copper of any diameter and any gauge. The last half of the book is given up to tables of weights and measures covering all the different products in brass and copper, and rules for finding the circumference, diameter, &c., of circles. A comprehensive index is a feature of the catalogue. The publication will be found a useful and valuable hand book by buyers of brass and copper goods.

## Course in Sheet Metal Pattern Work.

The American School of Correspondence, Boston, Mass., announce that the trade scholarships at their disposal are almost exhausted and that on September 30 the offer of these scholarship will be withdrawn. Applications for the few remaining scholarships will be considered strictly in the order received, and after September 30 students can only be enrolled at the regular tuition fee of \$50. Correspondence courses are given by the school in sheet metal pattern work; mechanical, electrical, stationary, locomotive and marine engineering; heating and ventilation; plumbing and mechanical drawing. Thorough instruction in mechanical drawing is included in each course. The opportunity presented by the American School of Correspondence for young metal workers to obtain a thorough knowledge of mechanical drawing as applied to their trade is a valuable one. The course in this subject has been prepared and is in charge of a thoroughly practical and experienced sheet metal worker.

## FLASHINGS.

It was officially announced at the headquarters of the Amalgamated Association in Pittsburgh last week that the proposition submitted by the American Tin Plate Company for the Tin Plate employees to accept a reduction in wages on Tin Plate for export had been defeated. A number of lodges that at first voted almost solidly against the proposition reconsidered their action and voted in favor of it, yet there were not enough of these to change the general result.

The Pittsburgh plant of the American Tin Plate Company, New Kensington, Pa., is reported to be still running full, but the Pennsylvania mill at the same place is idle.

J. CALLAGHAN & SON, Sheet Metal workers, advise us that they have removed to their new factory at 623 Superior street, Cleveland, Ohio, where with increased space and better facilities they will be enabled to better serve their customers in all kinds of Sheet Metal, Metal Ceiling, heating and ventilating and general repairing work. In a little dodger which the firm are distributing they call attention to the fact that they give special attention to leaky roofs of metal, slate or gravel; also to repairing gutters and down spouts. The firm state that they make anything in Sheet Metal Cornices, Skylights, Smoke Stacks, Gutters, Pipe, Tanks, Radiator Shields, &c.

The Tin mill workers at the American Tin Plate Company's Works, at Chester, W. Va., which is a non-union plant, have adopted a new scale, which increases the limit of output to 11,000 pounds per turn. The regular Amalgamated scale of wages is paid at the plant,

but by the new arrangement the men are enabled to make better wages than the men at the plants controlled by the Amalgamated Association, as the limit of output per turn is about 1 ton greater.

DAVID REESE, formerly of the Griffiths Charcoal Iron Tin Works, at Washington, Pa., has been appointed assistant superintendent of the Sheet mills of the Laughlin Nail Works, at Wheeling, W. Va.

GEORGE J. RECORD, who established in 1882 the Record Can Company at Conneaut, Ohio, since absorbed by the American Can Company, has resigned the management of the plant, and has been succeeded by C. T. Draper of the American Can Company's Cleveland branch.

F. B. REEVES will sever his relations with the Philadelphia branch of the Wheeling Corrugating Company on or about October 1 next.

THE LALANCE & GROSJEAN MFG. COMPANY of New York are making some important improvements in their rolling mill plant at Harrisburg, Pa., including the installation of motors in place of the smaller steam engines and the erection of three large gas producers and five new annealing furnaces. The entire plant, consisting of a Bar mill, three Tin mills and one Sheet mill, is in active operation.

SUIT has been brought against the American Can Company for \$15,000 damages by Kling & Andrews of Chicago Heights, Ill., who charge that they made a contract in 1898 with the Union Can Company, since absorbed by the American Can Company, to take all their Scrap Tin for three years, and that the Union Can Company, being an integral part of the American Can Company, have failed to carry out the terms of their contract.

W. H. MULLINS, Salem, Ohio, is distributing an artistic circular under the title of "The Evolution of the Boat," illustrating and describing his Stamped Metal Canoes and Boats.

THE CORTRIGHT METAL ROOFING COMPANY, 50 North Twenty-third street, Philadelphia, who justly claim to be specialists in the manufacture of Metal Shingles, after 16 years' effort in this line of practical, up to date roofing material, have issued a neat little pamphlet telling in a simple and practical manner all about the Metal Shingles. The cover of the pamphlet bears a grotesque figure suggesting a man in armor, the head, body and arms being formed of Metal Shingles. The company call particular attention to their Cortright Metal Slates and Victoria Shingles, in addition to which they make a patented Ridge Coping, also the Cortright Patent Valley, for use with their special forms of metal roofing.

THE HAMPDEN CORNICE WORKS, Springfield, Mass., have the contract for the metal work for the Richmond Estate at Woodstock, Vt. They are also doing the metal work on the Insane Asylum at Northampton, Mass.

CHINESE TIN has lately appeared upon the London market. Recent market reports state that a fair business has been done in Tin from the Province of Yunnan, China.

THE business of the Richmond Supply Company, Richmond, Va., was begun in February, 1902, to manufacture Ricimate Fire Proof Paint and Dura Elastic Roof Paint. The former is applied to wood and all combustible material and the latter to tin, corrugated iron and also to galvanized iron. Both are referred to as having the highest qualities to resist atmospheric injury and to prevent inflammability or progress of fires where they may be started.

T. S. CASEY, Marquette Building, Chicago, has been appointed agent for the sale of Pipe, Sheets and Plates manufactured by the Wheeling Steel & Iron Company, Wheeling, W. Va., covering the States of Illinois, Indiana, Wisconsin, Minnesota, Iowa, Nebraska, Kansas and Colorado.

THE KIEHL IRON WORKS, Algiers, La., recently incorporated with a capital stock of \$5000, have a completely

equipped plant for doing all kinds of Sheet Iron, Tin, Galvanized and Copper work. They will make a specialty of fuel oil tanks. The incorporators are Charles I. Kiehl, Floyd W. Morgan, and Arthur and Frank C. Duvic.

WORK has just begun in the Muncie (Ind.) plant of the American Sheet Steel Company on the installation of two new sets of cold rolls, which will largely increase the capacity of the mill. The concentration of all the pumps into one pump house has also been accomplished, resulting in an effective increase of power. The battery of boilers, which was a detriment by being too near the furnaces, making it impossible for the men to work in hot weather, has been dismantled. Many other general changes for the better have been made about the plant, the company having expended \$25,000 in the way of improvements during the past four months.

THE hot mills of the American Tin Plate Company that are idle are the Shenango and Greer mills at New Castle, Pa.; the La Belle, Wheeling, W. Va.; Anderson, Ind.; Gas City, Ind.; Connellsville, Va.; Elwood, Ind.; Pennsylvania Works, New Kensington, Pa.; Muskegon, Mich.; Lisbon, Ohio; Canonsburg, Pa.; Irondale, Ohio; Atlanta, Ind. The Laughlin plant at Martin's Ferry, Ohio, is in partial operation.

THE plant of the Sharon Tin Plate Company, at Sharon, Pa., which has been idle for several weeks, resumed partial operations on Tuesday, September 2. Ten of the 20 hot mills in the plant started up and the other ten will be started in a short time.

THE AMERICAN STEEL ROOFING COMPANY, Middletown, Ohio, are calling attention to their Polygon Conductor Pipe, which they claim is not only more durable, handsome and strong than other kinds of Pipe, but also has the advantage of obviating the trouble often met with in Conductor Pipe from expansion and the bursting of ice formed in it.

### International Fire Exhibition.

The British Fire Prevention Committee, an official body whose headquarters are at 1 Waterloo Place, London, S. W., have arranged to hold, from May to October, 1903, at Earl's Court, near London, an international exhibition of fire extinguishing and life saving appliances. Recognizing the soundness of the maxim that "prevention is better than cure," the promoters of the exhibition intend to give special prominence to the subject of fire prevention in methods of building construction and equipment. The exhibition is to be divided into various sections covering the whole subject of fire prevention. Section 6 will be devoted to Water Supply, under the sub-heads of Water Works, Reservoirs, Water Works Installations and Machinery, Private Water Supply, Fittings, Hydrants for Street and House Use, Pipes, Stop Cocks, &c. A series of diplomas and medals will be awarded to successful exhibitors in the different classes. Floor space will be provided at the rate of about \$1 per square foot, and exhibitors will incur no further expense beyond the transportation of their exhibits and the equipment of their stand. The undertaking will be under the management of the London Exhibitions, Limited, Earl's Court. The exhibition buildings which exist there are said to be admirably fitted up with regard both to decoration and sanitary arrangements. Foreign exhibits are solicited. No duty will be payable on such exhibits entering England, while special advantages will be granted by shipping and railroad companies to facilitate the transportation of foreign exhibits. Information in regard to space, &c., will be supplied on application to the secretary the British Fire Prevention Committee, 1 Waterloo Place, London, S. W.

The announcement is made that Alexander C. Humphreys has definitely accepted the presidency of the Stevens Institute at Hoboken, N. J. Mr. Humphreys was graduated from the institute, and has been for years one of the leading gas engineers of this country and of England.

## HEATING SWIMMING POOLS.

BY S. W. M.

The increase in the number of buildings in which a swimming pool is a feature is bringing to many heating contractors throughout the country the problem of heating a large quantity of water and the provision of a suitable plant for the work. In the past the magnitude of the requirements has not been thoroughly understood, and as a result the contractor in many instances has suffered no inconsiderable annoyance and frequently some loss. Even when those called upon to equip such pools with suitable heating apparatus have been willing to employ a consulting engineer to aid them in the work they often have been unable to find a suitable person or they have found the conclusions of different authorities somewhat at variance. In all engineering calculations common sense can be used with advantage, especially where there is no experience on which to form a judgment. The same commodity can be used with equal advantage in considering the basis for the calculations and the application of the calculations for heating swimming pools.

In order to give some assistance to those who are interested in this problem we give the dimensions of a swimming pool and the method of arriving at the size of boiler needed for the work of heating it, used by an engineer who has written the specifications for equipping a number of these institutions. Assuming that the pool is 20 feet wide and 35 feet long, to have water 6 feet deep at one end and 3 feet deep at the other, it will be readily seen that the average depth is  $4\frac{1}{2}$  feet. By multiplying 35 by 20 and then by  $4\frac{1}{2}$  it will be seen that the pool will have 3150 cubic feet of water. By multiplying this by 62 $\frac{1}{2}$ , the number of pounds of water in a cubic foot, it will be seen that there are 196,875 pounds of water. If this water is to be taken directly from the street mains the temperature will vary with the time of year and the depth of the mains below the surface of the ground. Assuming that it was 40 degrees and that it was desired to raise the temperature of the water to 80 degrees, it will be seen that another little calculation is necessary.

A heat unit is the amount of heat required to raise 1 pound of water one degree. It would require 40 heat units to raise 1 pound of water 40 degrees; consequently, 196,875 pounds of water in the pool must be multiplied by 40 to know the number of heat units required to heat the water, when it will be found that 7,875,000 heat units will be required. This much of the calculation is reasonably reliable, and room for the use of some common sense comes in the calculations that remain to be completed. High grade coals burned under perfect combustion liberate about 14,000 heat units; but when this same fuel is burned in the ordinary steam or hot water boiler a considerable amount goes to waste in the form of unconsumed gases and coal, which pass to the ash pit with the ashes in more or less volume, according to the intelligence of the fireman. In consequence, it is the common custom to calculate that from each pound of coal about 7000 heat units will be utilized. By dividing the 7,875,000 heat units by 7000 it will be seen that 1125 pounds of coal will be required to heat this amount of water in one hour's time. Ordinarily more time is given, however, because few institutions will be willing to make the outlay for the boilers necessary to heat such a pool in one hour's time. If six hours are allowed it is only necessary to divide the 1125 pounds of coal by six to find that but 187 pounds of coal per hour would be necessary.

The class of boilers adapted for such work and the chimneys to which they are ordinarily connected are not capable of burning much more than about 6 pounds of coal per square foot of grate surface, so that by dividing the 187 pounds of coal by six it will be found that boilers having 31 square feet of grate surface will be required to heat the water. If boilers of the vertical sectional type are used two boilers having grates 42 inches by something over 4 feet would be required. For the work by this calculation it will be found that more boiler capacity is determined upon as necessary than is ordinarily provided for such work. As indicated

at the beginning of this article the heating contractor and his customer in far too many instances have suffered inconvenience and sometimes loss, owing to insufficient capacity. Should the contractor have his work passed and secure his money the customer will be the loser, as he will be called upon to fire the boilers harder and burn more fuel, making a continual expense, than would be necessary if boiler capacity such as is arrived at by above calculation had been provided.

However, as has been pointed out, the amount of heat derived from the coals, the ability of the boiler to submit the heat generated in it economically, and the intelligence of the fireman, all have a very important influence on work of this kind, and if the contractor can secure the price of an ample plant it will be better to provide ample capacity rather than a plant having a scant capacity. It is claimed by those who have had experience that the grate surface required will vary very little, whether the water is to be heated by means of steam or by circulating the water through the boiler by means of large pipes. It is further claimed that when the water from the swimming pool is circulated directly through the pool it is better to use pipes of a sufficient size to allow the water to flow freely and prevent it becoming highly heated, rather than to use smaller pipes and heat the water to a higher temperature when it is possible that a disagreeable hot current may be experienced in some parts of it. If large pipes are used it is claimed that all parts of the tank will be heated satisfactorily without running a perforated distributing pipe along the sides of the tank, so that the hot water will enter the tank at various points.

## Nationalization Plan for Journeymen Plumbers' Union.

One of the most important actions taken at the recent annual convention of the United Association of Plumbers, Gas Fitters and Steam Fitters' Helpers in Omaha, Neb., was the adoption of a nationalization plan recommended by the Executive Committee of the union. The various local unions under this plan will pay to the national organization such funds as may be required, a strict account being kept of the transactions. At the end of the year a balance will be struck and the unions which have contributed more than the average will be repaid, while those whose contributions to the general expenses of the association have not been as much as the average will be required to pay the difference. This plan, which was adopted unanimously by the convention, will not go into effect until next year. The convention has referred the matter, with its approval, to a referendum vote of all the members of the union. The vote will be taken by the 350 affiliated unions on October 27, and the final adoption of the plan will depend upon the result of this vote. It is understood, however, that the attitude of the journeymen plumbers is such as to insure the approval of the plan.

The plan is somewhat of a departure in American unions, although it has been in effect to a great extent in the German unions, and was brought from that country with slight modifications by the Cigar Makers' Union, by which it has been operated with more or less success for several years. The plumbers' plan is a slight modification of that of the cigar makers. There is provided a death benefit of \$100, a sick benefit of \$5 per week for a term of 13 weeks and a strike benefit of \$5 per week for 16 weeks, after which the benefit drops to \$3. The most radical feature is an old age pension of \$500. This is paid to a member of the union who after having carried membership in the union for 25 years becomes incompetent by reason of old age.

W. R. YOUNG, a master plumber of Kansas City, Mo., has filed a petition in the Circuit Court, declaring the local Master Plumbers' Association to be a "trust," operating in violation of the Missouri Anti-Trust law. He alleges that his business has been seriously damaged by members of the association, who have refused to sell him supplies because he was not a member. He asks \$30,000 damages.

## A NEW USE FOR STANDING WASTE FITTINGS.

BY HELMAR.

In the accompanying sketch is shown the application of standing bath waste fittings to the service usually obtained from cistern valves. The fittings are easily adapted and accomplish the purpose of a cistern valve most admirably. When once properly fitted they are positive and serve the purpose more perfectly than any regular stock article in the market. The reference letters on the sketch are: A, bar lead weight coiled around the lifting stem, not always necessary except in very shallow tanks; B, overflow holes in stand pipe—these supply air to drain the line when water is off; C, standing waste or overflow pipe to which cable is attached—always kept off seat by hooking the cable down when water is on; D, rigid water tight casing of the fit-

*A New Use for Standing Waste Fittings.*

ting; E, cast top piece of casing—acts as a guide for the standing pipe C; F, strainer; G, collar holding tub waste piece into bottom fittings; H, gasket ring of waste, seated in bottom fitting; I, brass tail piece passing through bottom of tank—specially made; J, house service pipe; K, top piece of standing waste pipe; L, board, through which passes the top of waste fitting to hold it steady; M, wiped flange, joining tail piece to lining of tank.

The only difference of much consequence between the regular bath standing overflow and connected waste and that for use in a house tank is that the pipes C and D must always be long enough to reach above the top of the tank. If the tank is 2 feet or less in depth no change is necessary in the fitting proper. The writer always taps the top of piece K and screws in an eye bolt to attach the cable to. The stem of the bolt is a good place to coil enough weight to overbalance the cable. Overflow holes B are too low in the regular fitting unless the tank is very shallow. They can be stopped and a hole drilled in the top of piece K instead. The waste connecting piece F, as used on a tub, is longer than necessary for tank use. It should be sawed off short or a strainer fitted in the collar G instead. The

tail piece I, shown in the sketch, is somewhat like a female solder nipple inverted, except that it has a flange near the upper end and is threaded down to a washer shoulder inside. The bottom end of the standing waste screws down in it and seats on a washer, this special piece taking the place of the regular tail piece and collar.

The first time the writer used one of these waste fittings in an attic tank he made all the changes on the job himself. The service was lead and was brought through and flanged on the tank lining first. Then, with the end of the service projecting far enough for the solder to "take" on it the collar of the bottom piece was wiped down, thus joining the collar, tank lining and service at the same time. Then, with a good washer in the tail piece (collar) the fitting was screwed down water tight. The top piece E has a flange and long screw to adjust the bight. If the tank is to have a cover the brace L can be placed flush with the top of the tank and the flange of E run down on it. The guide pin on piece K, as used on a bathtub, must be cut off so that the pipe will rise and fall freely by using the cable.

The cable may end at any point desired. It should have a ring on the end to hook over a catch on the wall when pulled down to open the valve. A second catch should be placed above the first to hold the ring when the water is off. If the house is tall and there are several pulleys, making an indirect course to the lower end of the cable, it is best to clamp a counterweight to the cable itself, some distance above the eye bolt. This will keep the cable taut so that it will not jump off the pulleys when the strain of holding the waste up is off. If a shop decides to use these fittings in place of cistern valves, it is best to get some tail pieces made on the order of the one shown in the sketch. The fittings complete can be ordered any length and with strainer in collar G instead of the whole connecting piece F.

The advantages of the use of this fitting are that it makes a better job than is possible with the regular valve; there is no need of wiping in an air pipe below the valve connection and carrying it up and over the tank, the overflow holes or a hole in top of K admit air every time and drain the line dry from above the level of the tank bottom, which is impossible with the regular valve; the strainer comes far enough above the bottom of the tank to keep out of the way of sediment, and should it ever be necessary to put a new washer on the valve it can be done without emptying the tank.

## Walker and Crawford Boilers.

The Walker & Pratt Mfg. Company, Boston, Mass., have issued an illustrated circular calling attention to their Walker and Crawford boilers for steam or water heating. The Walker boiler, as previously described in these columns, is of the vertical section type and is made in four sizes. The New Walker boiler is of the same type and is made in 17 sizes to meet the demand for a boiler of large capacity. It is supplied with a fire box of extra depth, having the combustion chamber well arched at a good height above the fire. The flues are easily cleaned from the front. The sections of this boiler are connected by the use of malleable iron, copper coated, tapered push nipples. The drums formerly used in sectional boilers are not required with this construction; the boiler therefore occupies less space and may be placed close beside a wall or pier when necessary to save space. The Crawford is a round boiler having as a new feature extended surfaces or heat ribs in the fire pot, increasing the power of the boiler and saving coal. It is entirely water jacketed, and has no flue covering plates to warp and burn out or radiate heat in the cellar. It is made in four sizes.

THE contract for the plumbing, heating, mantels, tiles and marble work in the new Lincoln apartment house in Youngstown, Ohio, and for the plumbing and heating of the new Wood Street apartment house in the same city, have been let to the Stambaugh-Thompson Company of Youngstown.

## EASTERN TRADE GOLF ASSOCIATION TOURNAMENT.

Secretary H. A. Smith of the Eastern Trade Golf Association has sent out from his office, 1123 Broadway, New York, the following letter announcing the arrangement for the fall tournament, to take place next week under the auspices of the association:

'Captain Molby asks me to announce that the governors of the Fox Hills Golf Club, Staten Island, have kindly offered us the use of their grounds, free of greens fees, for September 11. It has accordingly been decided to hold the fall tournament at that time and place.

"Players must leave New York on the 9 a.m. Staten Island ferry. The captain and committee will meet the players at St. George, Staten Island. Any members who may be late in arriving at St. George will take the Staten Island Rapid Transit Road to Clifton, where omnibuses will be waiting.

"An 18-hole qualifying game will be played in the morning, to determine the classes into which the players will be divided for the afternoon play.

"In the afternoon the players will be classed in groups of four and will play 18 holes, medal play. This distri-

Eastern Trade Golf Association Tournament.—"The Metal Worker" Cup.

bution of the classes gives every player every chance for a prize.

"The prizes thus far provided are the Club Challenge Cup for the winner in the first class; the Pierce, Butler & Pierce Mfg. Company Cup for winner in second class; *The Plumbers' Trade Journal* Cup for winner in third class; *The Metal Worker* Cup for winner of fourth class or runner up in first class, as may be determined by the governors; *Domestic Engineering* Cup for winner in the driving contest, unless otherwise arranged by the governors, and *Engineering Review* Cup for best medal play for 36 holes. Several other prizes will be forthcoming."

Since the meeting of the Eastern Trade Golf Association on August 15, the following new members have been elected:

H. C. Adams, the Manufacturers' Credit Association, New York.

J. A. Goodrich, the Judson A. Goodrich Company, New York.

C. J. Hills, the Haydenville Company, Haydenville, Mass.

F. S. Hanley, Association of Manufacturers and Jobbers in Plumbing Supplies, New York.

C. V. Kellogg, Federal Boiler & Supply Company, New York.

T. G. Knight, the Thomas G. Knight Company, Brooklyn, N. Y.

L. P. Paul, Frank C. McLain, New York.

W. S. Reins, W. L. Rogers and G. F. Ross, Central Foundry Company, New York.

C. K. Sanborn, the Haydenville Company, New York.  
P. H. Seward, Model Heating Company, New York.  
F. H. Simmons and H. S. Walton, the John Simmons Company, New York.

This makes a total membership of 60 to date.

## The Glauber Company's New Factory.

The Glauber Brothers Mfg. Company, Cleveland, Ohio, have recently acquired a well located piece of property in the eastern district of that city, on which they intend to erect one of the best equipped and most thoroughly modern brass factories in the United States. For a long time they have been considerably handicapped for lack of floor space in their different departments, and on a number of occasions have been obliged to make additions to their present factory, but their continued rapidly growing business has now compelled them to seek new quarters for the purpose of insuring sufficient facilities to meet their increasing demands.

The company will erect several buildings. The main structure, which will contain the different machines for finishing brass goods, together with assembling rooms, shipping rooms, &c., will be 150 x 300 feet. The foundry will be provided with an entirely separate building, 80 x 150 feet, which will be strictly fire proof and built of pressed brick, stone and iron. It will be fitted with Luxfer prism glass skylights, which will make it one of the best lighted foundries in the country. It will also be one of the best ventilated. The roof will be carried on steel trusses, so that not a single post will obstruct the floor of the foundry. Considerable time and thought have been devoted to every detail so as to make the arrangements for handling goods complete in every respect. All departments will be on the ground floor, thus avoiding the loss of time required by the use of elevators if upper stories were used. The company expect to be located in their new plant about December 1 and will then be pleased to have their friends and customers call to inspect it.

## Ideal Boilers.

The American Radiator Company, Chicago, have issued an exceedingly attractive 48-page catalogue, which treats mainly of their Ideal boilers, but also gives much information relative to radiators. This catalogue is bound in heavy paper covers, ornamented with four-leaved clovers embossed on the front. The foreword in this catalogue calls attention to the excellence of design, high finish, superior quality and unrivaled assortment of American radiators. Illustrations are given of the seven different plants of the company in which these radiators are produced. From radiators an easy transition is made to boilers, and attention is called to the fact that in each type of Ideal boiler every line has been laid and stands for one purpose—efficiency. The proportion or ratio between areas of grates, heating surface, flues, water ways, water capacity and connections has been made as perfect as mechanical practice admits. Every feature has been carefully developed by a group of inventors, designers and mechanical experts, whose experiences and ripest ideas are solely devoted to the advancement of the company's products. The 12 pages following are devoted to illustrations of the various types of American radiators, comprising all varieties and styles. These are accompanied by tables giving price-lists and measurements. The remainder of the catalogue is almost wholly devoted to illustrations and details relative to steam and hot water boilers. The boilers shown comprise the Ideal sectional steam boilers in four sizes, the Ideal sectional water boilers in four sizes, the Ideal Premier boilers for steam and water, shown in perspective and in section; the Ideal portable steam and water boilers, in perspective and in section; the Ideal Invincible and Junior boilers; the Ideal water boilers or tank heaters, and the Acme fire box boilers. Price-lists, measurements and other details fill several pages. A complete telegraph code completes the contents.

### The Williams Pump.

The Williams Pump Company, 404 South Senate avenue, Indianapolis, Ind., are offering the pump shown in the accompanying cut, Fig. 1 of which represents the pump ready to pull out for repairs, Fig. 2 showing it in the act of lifting water. The barrel of the pump is 3 inches in diameter, made of steel boiler tubing, and being of uniform size requires no cylinder, as the entire stock acts as such. In order to repair the pump the handle and fulcrum are taken off, the bucket is dropped, as shown in Fig. 2, over the valve cage at the bottom;

Fig. 1.

Fig. 2.

The Williams Pump.

the rod is then turned to the right several times and the entire working parts of the pump are pulled up, as in Fig. 1. It is explained that a bar across the valve cage raises the poppet valve in the bucket, which allows the water to pass through, and that the valve cage and the check valve being lifted off the seat the suction is broken and the rod, bucket and valves can be drawn out with ease. It is pointed out that this arrangement obviates tearing up the platform, getting into the pit and uncoupling rusty pipes to take out the bucket and valves. After repairing the parts they are put in the same position as before, placed in the barrel, dropped to the bottom and the screw rod is turned to the left until the bucket and valve cages are disconnected. The fulcrum and handle are then replaced, and in ordinary wells, it is remarked, the pump will work without priming. The time required for repairing the

pump is stated to be 15 minutes. The bars in the valve caps and the lugs on the cage form a brace to allow the bucket and valve cages to connect or disconnect by means of threads. The pump has a brass drain cock that can be opened or closed at will, to prevent water freezing and bursting the pump. It also prevents a continual waste of water. The base being fastened by set screws is adjustable. The manufacturers state that the flow of water is perfect and that the pump has no age limit.

### Richmond Heaters.

The Richmond Company, whose main office and works are at Norwich, Conn., and whose New York office is in the Park Row Building, have issued an exceedingly attractive catalogue of 78 pages. It is bound in heavy paper covers, having an illustration of a Richmond boiler embossed in red on the front cover. The contents of this catalogue are of a character to greatly interest heating contractors, as well as others who are investigating the merits of different types of boilers. Not only are illustrations given showing the usual exterior and broken views, but numerous cuts are presented showing sections in outline and details of all the parts. The styles of flues used for hard and soft coal respectively are thus set forth in a manner to enable their construction to be thoroughly comprehended. These outline views are so numerous as to cover many pages of the catalogue.

The first construction to which attention is called is the D series of the Richmond boiler for steam and for water, shown in the 18, 21, 24, 36 and 50 inch sizes. This boiler is of the vertical section type, and the illustrations presented cover a wide range of sizes adapted to all requirements. Tables of dimensions and capacities giving all such details needed by fitters take up ten pages. The No. 830 steam boiler and No. 307 hot water boiler are likewise illustrated and described in full, together with complete tables of dimensions and capacities. The Round Richmond boilers receive ample treatment. These boilers are thoroughly original in design and so simple in construction that "they can be set up as easily as a sheet iron stove." The main body of the boiler is in one single casting without joints of any kind. Water ways are arranged in star shape with arms radiating from a common center immediately above the fire pot. This insures very rapid heating of the water, making the boiler of high efficiency. The Round boilers are made in a variety of sizes to suit all requirements. This catalogue is so handsomely gotten up that it will undoubtedly be preserved for frequent reference.

### Plumbing Inspection in Washington, D. C.

The annual report of O. L. Ingalls, Inspector of Plumbing in the District of Columbia, just submitted to the District Commissioners, shows 22,621 inspections under the direction of his office during the fiscal year ending June 30, 1902, an increase of 929 over those of the previous year. These comprise 3868 examinations of existing plumbing, 7126 inspections of remodeling, extensions and repairs, 6017 inspections of plumbing in new buildings, 1996 peppermint tests, 1283 inspections of gas fitting and gas fixtures, 658 inspections of lead water service pipes, 754 sewer laterals tapped into main sewers, 55 new terra cotta house sewers and 760 repairs to terra cotta sewers. Plumbing plans were examined and approved and certificates issued for 1008 new buildings, an increase over last year of 37.

Thirty-eight cases involving violations of the plumbing and gas fitting laws and regulations were brought to the attention of the police court; 19 were for violation of the plumbing laws, three for employing unregistered plumbers and gas fitters, one for excavating public space without a permit and 15 for violation of the plumbing regulations. Fines were imposed in 18 of these cases. Mr. Ingalls urges that the question of providing toilet stations for both men and women in the city of Washington is of such importance that efforts should be made to secure permission from Congress to establish such stations without loss of time.

### Lawler's Boiler Connection Fittings.

The growing custom of connecting range boilers with water backs by means of brass pipe has confronted the plumber with many difficulties, owing to the lack of proper or convenient fittings. In the accompanying illustrations are presented two fittings adapted for special use. Made by the Lawler Water Feed & Damper Regulator Company, 181 Mercer street, New York. In Fig. 1 is shown a special boiler tee, particularly adapted for connecting the pipe carrying hot water from the water heater to the hot water service pipe at the top of the

Lawler's Boiler Connection Fittings.—Fig. 1.—Special Tee for Quick Heating Connection.

boiler. This form of connection is specially desirable with gas heaters and also where the water back has hardly sufficient power for heating all of the water in a boiler with which it is connected. This tee is made in two forms. That shown in Fig. 1 is designed to connect with the regular boiler spud, screwing on to the outside of it at the top, and is arranged so that the regular coupling can be connected to the top of the tee. The tee is also arranged so that the boiler spud can be removed entirely, and the tee with a male thread at each end screwed in the place of the spud and the regular boiler coupling screwed on the top end of the tee. The tee shown in Fig. 1 is well adapted for making a top connection, where the boiler is already connected up with lead service pipe, as the pipe can be bent so as to permit

Fig. 2.—Lawler's Return Circuit Check Valve.

the insertion of the new tee. Another fitting which is of convenience where a circulating system is used, is the return circuit check valve shown in Fig. 2. This is connected to the cold water pipe at the bottom of the boiler which supplies the water back, and prevents short circulating or the cold water running up to the circulating pipe and flowing from some nearby hot water faucet. The check in this valve, when in its normal position, is fully open, and being made of aluminum it is very light and rises to its seat readily at the slightest back movement of the water.

The company have recently issued a new catalogue calling attention to these fittings and many others that are of equal interest and convenience to the plumber.

THE plumbing shop of Ed. Hantz of York, Pa., was damaged by fire on August 28.

### New York City Notes.

Trade is steady, with nearly every one doing something. The jobbing and overhauling plumbers report that they are getting busy, with good prospects for the fall.

\* \* \*

Among the new work plumbers on the West Side, Polatschek & Spencer of 2603 Broadway are probably the busiest, part of their work being a six-story apartment on Ninety-fourth street, east of Riverside Drive, and on Ninety-seventh street, west of Broadway, and the same street, east of Riverside Drive, two ten-story apartments, each 100 foot front.

\* \* \*

Some of the other West Side jobs are five private American basement houses on One Hundredth street, west of Broadway, which are being done by Black Brothers of St. Nicholas avenue, and an eight-story apartment on Broadway, between Ninety-fourth and Ninety-five streets, being done by J. J. Falihee, while Lyman & Costello have two eight-story apartments, each 100 x 100 feet, on Ninety-fourth street, east of Riverside Drive.

\* \* \*

W. Y. Jack & Co. are still getting work, having a factory at 520-528 West Twenty-seventh street and an apartment at 135 to 141 West Twentieth street.

\* \* \*

Chas. Hensle, who is located in the fashionable apartment house locality, has a job at 129-131 West Forty-seventh street; T. A. Hill has an apartment at 139-141 West Forty-fourth street; Chas. T. Mander is plumbing an apartment at 142-146 West Forty-ninth street; John F. Barry has a bachelor apartment at 17 to 21 West Thirty-second street, and Thomas Kirkwood has two private houses on Fifty-second street, west of Park avenue.

\* \* \*

Association matters are quiet just at present, but this month will bring the members back from the country and meetings in all the branches are likely to be well attended.

### Heating and Plumbing Notes.

W. J. HYLAND, Springfield, Mass., has just completed the contract for steam fitting and plumbing the establishment of the Henly Machine Company. Mr. Hyland has lately been awarded the contract for the heating of C. E. Lynch's store on Main street, Springfield, and has a number of other heating and plumbing contracts in hand.

THE LOUIS LIPP COMPANY, manufacturers of Plumbers' Supplies and Iron Enameled Bathtubs, Cincinnati, Ohio, advise us that they have been very busy getting settled into their new quarters on Mitchell avenue and the B. & O. S. W. Railroad at Winton place, a suburb of Cincinnati. The new plant is of very large size, occupying an entire block, the different buildings being 600 feet long. The company are sending out an illustrated folder calling attention to their new patented Low Down Closet Combination. Illustrations are given showing the Champion, Columbian and Universal Low Tank Wash Down Siphon Combination Closets, and the Glenwood Low Tank Siphon Jet Combination. The Tanks and Covers that go with these goods are made of quarter sawed oak lumber, and the fixtures are of the highest grade, manufactured at the concern's own works. The company have a branch at 20 High street, Boston, Mass.

BIDS for the gas fitting, sewerage and plumbing, according to plans and specifications, of the hospital building of the St. Louis Southwestern Railway Company at Texarkana, Ark., will be received until September 15 at the office of R. M. Milligan, 120 Chemical Building, St. Louis, Mo.

JAMES A. MOORE of Seattle, Wash., is installing a \$25,000 steam heating and power plant in the Arcade Building in that city.

GEORGE NORWOOD, Biddeford, Maine, has been awarded the contract for plumbing and heating the Thornton Memorial Library at Saco, Maine.

THE directors of the Street and Sewer Department of the city of Wilmington, Del., have awarded to Joseph Jenkins of that city the contract for installing a steam heating plant in the new city building at the corner of Sixth and King streets, at his bid of \$398.

M. M. MILLS is closing out his stock of Plumbing Supplies and Hardware at Cooperstown, N. Y.

SEALED PROPOSALS for the construction work and heating in connection with the erection of an armory for the Sixty-fifth Regiment, N. G., N. Y., in Buffalo, N. Y., will be received at the headquarters of the National Guard, room 161, 280 Broadway, New York City, until noon, on Tuesday, September 9.

CHAIRMAN MEADE D. DETWEILER, at Harrisburg, Pa., will receive bids until September 10 for plumbing and heating with steam, vapor or hot water, the National Home for Aged Elks, at Bedford City, Va. Plans and specifications can be had on application to the architects, Lewis & Burnham, National Bank Building, Lynchburg, Va.

FRANK P. TULLY of the plumbing firm of Dolan & Tully, Columbus, Ohio, died on August 23 at his home in that city from a complication of ailments, from which he had suffered for some time past. Mr. Tully, who was in his thirty-eighth year, leaves a wife and two children.

THE plumbers' strike at Norfolk, Va., which has been on for more than two months, is still unsettled, without indication of an early agreement. There is some talk of the master plumbers importing labor from other cities to fill the place of the strikers.

DR. J. T. DURYEA, who for some time has been medical superintendent of the Kings County Hospital, Brooklyn, N. Y., has resigned his office to accept the position of general manager of the Colwell Lead Company, 63 Centre street, New York, and will take up his duties with that concern about October 1. Dr. Duryea is one of the best known Brooklyn physicians, and under his management the Kings County Hospital has been made a model institution.

THE seventh annual convention of the Washington State Association of Master Plumbers opened at Plumbers' Hall in Seattle on Monday, August 25. A business session occupied the morning, and in the afternoon the members of the association and their friends were taken on a pleasant excursion on Lake Washington. In the evening the delegates were entertained at a reception and ball tendered in their honor by the Seattle master plumbers. The business of the convention was continued the following morning, and in the afternoon the visiting delegates were taken to the races, where one of the events was a race for a prize of a silver cup offered by the master plumbers of Seattle. The sessions of the convention continued on Wednesday and Thursday, and concluded with a banquet tendered to the visiting delegates by the local master plumbers.

At a meeting of the Master Plumbers' Association of Grand Rapids, Mich., held last week, the matter of compensation for unsuccessful bidders on jobs was discussed and a resolution was adopted declaring that, beginning September 1, 1902, the members would make a minimum charge of 2 per cent. on the gross amount of each contract figured on, whether from architect's plans and specifications, or from those furnished by the owner. This action, it is stated, was made necessary to prevent customers peddling their bids around a dozen establishments, each one of which is put to a large expense in taking measurements and making estimates, for which the firm get nothing unless they should happen to be the successful bidders. This amount of 2 per cent. will be payable upon delivery of the bid. The successful bidder, however, will not receive any compensation.

Bids will be received until September 11 by the School Board of Greensboro, N. C., for the heating of the Lindsay Street School Building in that city, the work to be completed by December 1, 1902.

MARK CONNOLLY, at one time a well-known plumber of Pittsburgh, Pa., died on August 29 at his home in the suburbs of Knoxville after an illness of three weeks from appendicitis. He had been an invalid for some time and not able to follow his trade. Mr. Connolly

was born in Ireland and came to this country when 18 years of age. He is survived by three sons and four daughters.

WE have received a copy of the proceedings of the second annual convention of the State Association of Master Plumbers of California, held in April in San Francisco. In connection with these proceedings a synopsis is given of the formation of the Interstate League Association of Master Plumbers of the Pacific Slope, held in San Francisco on April 21 to 23. The cover of the pamphlet calls attention to the fact that the Pacific Slope is to be honored by the twenty-first annual national convention of the National Association of Master Plumbers of the United States, which is to be held in San Francisco in 1903.

THE PRIZER-PAINTER STOVE & HEATER COMPANY, 156 Fifth avenue, New York City, have issued a card of neat design calling attention to their Henderson Water and Steam Heaters. The card is of the size of a postal card and bears on it the trade-mark of the company, together with an illustration of the Henderson Vertical Section Heater.

J. C. ST. JOHN of Colorado Springs, Col., has secured the contract for placing a new heating apparatus in the Santa Fé, North and Park streets school buildings at Trinidad, Col. The contract is for about \$5200.

T. J. HUMPHREY of Kalamazoo, Mich., is manufacturing a Water Lift, known as the National.

It is reported that a company have been organized with a capital of \$15,000 to manufacture Faucets at Antrim, N. H. Enos W. Thayer of Meredith, N. H., is interested in the enterprise.

THE contract for heating and ventilating the new St. Joseph's School, connected with St. Elizabeth's Church at Convent, N. J., has been awarded to Tompkins & Welsh of Morristown, N. J.

AUGUST GEIGER, Philadelphia, Pa., will install a hot water heating apparatus in the Jewish Maternity Hospital in that city.

#### New Firms and Changes.

THE OKLAHOMA IRON WORKS of Guthrie, I. T., have been incorporated with a capital stock of \$25,000. The new company intend to erect a foundry and machine shop and will engage in the business of installing steam heating plants.

THE HEATING & VENTILATING COMPANY of Wheeling, W. Va., have been incorporated with a capital stock of \$100,000 by A. G. Hubbard of Wheeling, A. L. Badger of Pittsburg, Pa., Henry A. Stengle of Wellsburg, W. Va., and others.

THE SOUTHERN BRASS COMPANY, recently incorporated in Baltimore, Md., with a capital of \$3000, to manufacture and deal in Plumbers' Goods and Supplies, have organized by the election of Frank A. Brandy, president; Edward A. Cassidy, secretary, and James R. Buckingham, Jr., superintendent.

THE STANDARD HEATING & SPRINKLING COMPANY of Montreal, Canada, have been incorporated with a capital stock of \$50,000, to install heating plants, fire extinguishers and electrical appliances, and to carry on a general plumbing business. The incorporators are James Cochrane, Henry Miles, Louis D. Robertson, John W. Blair and Francis J. Laverty, all of Montreal.

NATHAN RUBENSTEIN, 552 Grand street, New York, manufacturer of the N. R. Seat Attachment, has connected himself with Schulman & Co., general contractors, of 176 Broadway. The new firm will do a general plumbing and building business under the firm name of Rubenstein & Schulman. They will also continue to manufacture the N. R. Seat Attachment for water closets.

NELSON MORFORD AND DANIEL W. MILLER have formed a partnership to conduct a plumbing business at St. Johnsville, N. Y.

THE RICHMOND PLUMBING & MANTEL COMPANY of 26 North Ninth street, Richmond, Va., have been incorporated with capital stock of \$10,000. The officers are: J. G. Davidson, president; W. H. Yarborough, vice-president, and H. T. Burnley, secretary.

## THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

### WILL FURNACEMEN HELP?

From F. F. H., Woodbury, Conn.—I notice in *The Metal Worker* of August 30 an inquiry from "A. S." of Alden, Iowa, regarding the heating of two stores under the same roof. I should place a No. 30 Kelsey generator practically where designated on the plan shown in connection with the article referred to, and run one 16 and one 14 inch pipe respectively, as directly as possible into each store, just outside of the counters, using 16 x 20 and 14 x 20 registers respectively. Then I should take cold air from just outside of the counters in each store near the north front and following along close to the dividing wall with a 16 and 14 inch galvanized pipe respectively, connecting under the furnace at the proper place. These cold air pipes should be properly protected from contact with the cellar wall as well as the furnace itself, otherwise the arrangement would not work satisfactorily, for the wall would absorb a great part of the heat. Arranged this way I think the furnace could not help working perfectly and economically.

### HEATING SWIMMING TANKS.

From A. B. C., Massachusetts.—Will you kindly give a solution of the following proposition, with formula and result: A swimming tank is to be heated which contains 20,000 gallons, receiving its water supply from an artesian well at a temperature of 50 degrees. The water is to be heated to 80 degrees or raised 30 degrees in eight hours' time. No allowance is to be made for loss of heat by radiation from the sides of the tank or the surface. How many pounds of coal will be required? How large should the grate area be? What size of hot water heater should be provided, as expressed in square feet of radiation as commercially rated?

**Note.**—We would refer our correspondent to an article treating this subject that is presented in another column and also to a similar article printed in *The Metal Worker* of September 28, 1901.

### CLEANING SANITARY ENAMEL.

From T. R. W., Port Gibson, Miss.—Will *The Metal Worker* kindly give some recipe for removing stains from enameled iron bathtubs and washbowls.

**Answer.**—For beauty of luster, delicacy and fineness of surface and purity of color, the enamel of white enameled sanitary plumbers' ware has no equal, but like many other fine things it has a weakness, and its qualities for withstanding gritty or acidulated cleansing pastes or solutions are probably the frailest of all. The makers of this ware understand its nature better than any one else and they confine themselves to recommending the frequent use of soap and warm water, gasoline, or gasoline in water followed by soap and warm water. If cleansed daily, soap and water should be sufficient, and will if the surface has been properly cared for from the start. If, however, something is used that destroys the luster—that practically poreless fused surface—the enamel will eventually pit to the flint base and will deteriorate rapidly under any but the utmost care with the material first mentioned. Rust where the faucets discharge should not be allowed to accumulate. Indeed, the surface should be kept clean at all times, which is easy if not neglected. But if dirt or rust once get "set" on the surface it is not easy to remove and the temptation to resort to something radical is hard to overcome. When rust stains persist in showing it is probable that the surface is already imperfect and it is questionable whether it is better to let them remain or take the risk of pitting by continual hard cleaning. All enamels are not made by the same process and while

some articles might be cleaned with unusual material without injury, those of another make would be ruined by it. Therefore no directions for cleaning enameled goods can safely be published for general use aside from those offered by the manufacturers.

### RISES FOR ELBOWS.

From G. P., Battle Creek, Mich.—Will you kindly print in *The Metal Worker* the rises for elbows of from 3 up to 10 pieces and from 2 to 36 inches in diameter.

**Answer.**—The rise in an elbow is equal to the difference in length between the longest side and the shortest side of an end piece. In the accompanying illustration, showing a three-piece elbow, the distance A B is the rise. The following are the rises of elbows of from 3 to 10 pieces, the diameters of which are 1 inch:

|                                 |                                 |
|---------------------------------|---------------------------------|
| 3 piece elbow, 0.414 inch rise. | 7 piece elbow, 0.132 inch rise. |
| 4 " " 0.268 " "                 | 8 " " 0.113 " "                 |
| 5 " " 0.199 " "                 | 9 " " 0.098 " "                 |
| 6 " " 0.158 " "                 | 10 " " 0.087 " "                |

To find the rise for an elbow of any diameter multiply the rise given in the above table by the diameter

Rises for Elbows.

in inches of the desired elbow, and the result will be the rise in inches for the desired elbow. Thus, to find the rise for a seven-piece elbow whose diameter is 11 inches multiply 0.132 by 11, which will give 1.452 inches, the desired rise.

Sets of developed elbow patterns for two, three and four piece elbows of from 1 to 20 inches in diameter, 60 patterns in all, can be supplied by our Book Department for \$1, postpaid; also an Elbow Chart, by which is determined the rise of miter lines of elbows of any diameter and the number of pieces for any angle. The price of this chart is 50 cents, postpaid.

### ROOFING MATERIALS.

From Reader, Cumberland, Md.—I have seen a great deal written in your paper and other journals about tin as a roofing material, but I have not yet noticed any article regarding asbestos roofing, rubberoid roofing, Carey's roofing and lots of other roofing materials which are guaranteed for ten years and are claimed to be fire proof. If any of the readers of *The Metal Worker* have had experience with the above named style of roofings I should be glad to hear from them. In some localities a great deal of this kind of roofing is used.

### REMOVING STAINS ON WALL.

From S. B. W., Johnson City, Tenn.—I have recently put in secret gutters on a house that is covered with slate. The house is veneered with cream colored brick, and before the down spouts were put up the rain washed small particles down from the slate roof and stained the brick wall. The common muriatic acid used for cleaning a brick wall fails to remove this stain. I desire to know if you or any of your readers can give me a receipt for a fluid that will successfully remove this stain. If you can do this I shall be greatly obliged.

**Answer.**—We can only advise our correspondent to try a saturated solution of oxalic acid in water on the stained parts of the wall. Keep it wet for a few hours,

when it should be washed with water and a brush. This acid is very poisonous and should be avoided on the person and clothing. If this fails we would suggest rubbing the face of the stained wall with the same kind of brick and washing it. There is a possibility that sulphuric acid may do better than murlatic acid in some cases of stained walls.

### A QUESTION FOR PLUMBERS.

From D. F. N., New York.—Noticing the question of "D. & E.," with the accompanying sketches, in *The Metal Worker* of August 23, I herewith present my answer to the same. In the first place the drum trap is considered by sanitary experts a thing of the past. In most of our Eastern cities these traps have been condemned, as they are considered disease breeders, for the reason that foul matter may lie dormant in the interior of the chamber for months without cleaning. The three-quarter S and full S drawn lead traps are the standard traps, so far, nowadays, as it has been proved that they will clean themselves. Now in regard to the combination vent and trap cover in Fig. 1 of the illustrations in the article above

A Question for Plumbers.

referred to. In the sketch it appears to have a coupling which contains a washer on the vent connection. This would be held as a violation of the plumbing laws in New York City, as all connections outside must be made so that no jar or shock will disturb them. Another feature of the modern job is that the trap must be placed as near the fixture as possible. Grease traps with a special cold water jacketed chamber have been allowed to prevail where a special application has been made for the protection of the sink drain connected to the house drain. These are combined with the seat and interior of the trap, for the grease interceptor can be removed readily and replaced after cleaning. In the accompanying sketch is shown the latest method of performing the work under a bath.

### CLOSED TANK WATER SYSTEMS.

From Liberty Cap, Yellowstone Park, Wyo.—Kindly inform me through *The Metal Worker* as to the best method of connecting a closed expansion tank to a hot water heating system, if such a tank is to be recommended, where the pressure is 69 pounds to the square inch. Please give information by means of a cut, if it is not asking too much.

Note.—The experts who have given the closest observation to this method of heating agree that it is more expensive, as far as fuel consumption is concerned, but there may be a slight saving in the first cost of the plant. With a closed tank system there is always the element of danger due to the safety valve which should be placed

on it becoming stuck in its seat, allowing a high pressure to be generated which, on numerous occasions, has resulted in an explosion which has not only wrecked the heating system, but also done considerable damage to the building in which it was installed. Aside from these objections there is no occasion for any change in the method of connecting the tank from that which is common in the connection of open tanks. The closed tank should be so arranged that the air from the system can escape and the water can run in until it makes its appearance at the bottom of the tank. The supply should then be shut off and the safety valve set at whatever pressure the system is to carry. The expansion of the water, on heating, will compress the air that remains in the tank, which will serve as a cushion. It is claimed that such systems circulate more freely than open tank systems. This may be true where the piping has contractions or pitches that should be removed, or is of smaller size than should be used. This system is sometimes used to help out where the radiation is a little short, and by means of a higher temperature in the water, at some waste of fuel, it is made to serve a purpose. The open tank system, through its many advantages and absence of risks, having supplanted the high pressure or closed tank systems in public favor, it would be well in this instance for our Western friend to follow the blazed track.

### HEATING WATER WITH STEAM.

From A. B., Jersey City, N. J.—We should be glad to have information in reference to a piece of work which we are called upon to complete. It is proposed to put a 35-gallon boiler in the basement to take the place of the present range boiler in the kitchen. This boiler is to have no connection whatever with the water back of the range as the water back is to be taken out of the fire chamber and replaced with fire brick. The building is heated by a steam boiler and the proposition is to connect the pipe from the steam boiler with a coil inserted in the boiler, which it is thought should be suspended horizontally from the ceiling of the cellar. In the summer the water is to be heated by gas. What we should like to know is: Has this been done before? Would an upright boiler answer the purpose? Will a 1-inch pipe from the steam heater be large enough? How many feet of pipe should be placed in the coil? If an upright boiler be used should the steam pipe be connected at the top or the bottom?

Answer.—What our correspondent proposes is thoroughly practicable and is often done. It would seem, in this instance, that a horizontal boiler would be more convenient than a vertical one. Boiler manufacturers make boilers adapted for this work with steam coils in them so that all that is needed is a connection from the steam heater, the steam entering the coil at the top and the condensation leaving it at the bottom and returning to the boiler below the water line. A 1-inch steam pipe should supply all the steam necessary from a low pressure heating apparatus for heating the water in a boiler of the size mentioned. The coil should contain 1 lineal foot of 1-inch pipe for every 5 gallons of water to be heated, although some variation from this quantity of pipe will not interfere materially with successful operation. In an upright boiler the steam coil is located in the bottom of the boiler and the steam connection is made at about the same point that the hot water connection for the water back is made. The book, "Kitchen Boiler Connections," which can be furnished by our Book Department, gives information on this subject.

### REPAIRS WANTED FOR NEW ENGLAND RANGE.

From W. L. S., Lanes Bottom, W. Va.—I want to get repairs for a stove which has in raised letters on the door "New England Range Company," but no address is given. It is a regular steel range with six holes in the top and water tank on left side as one stands facing the range. I have written to several foundries, but can get no information as to the makers. If any of the readers of *The Metal Worker* can give me the desired address it will be greatly appreciated.

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** has declined about  $\frac{1}{2}$ c. during the week, with dull market.

**Copper** continues weak, with small volume of business.

**Pig Lead** is firm and quiet.

**Spelter** continues strong, with a marked scarcity of spot metal.

**Antimony** is quiet and unchanged.

**Nickel** is in fair demand at unchanged prices.

**Aluminum** continues in good demand, with prices unchanged.

**Tin Plates** are more active in a small way, but dull as to large business, with prices unchanged.

**Black Sheets** are in fair demand; prices quotably unchanged.

**Galvanized Sheets** are more active in a retail way, but prices are irregular.

**Scrap Iron** continues in active demand, with prices strong.

**Scrap Brass and Copper** are weak and dull.

**Foundry Iron** continues extremely scarce, with prices nominal.

**Sheet Copper** is in good demand and firm in price.

**Sheet Zinc** is fairly active, with prices very firm.

**Hardware** is moving in good volume, with prices, as a rule, steady and strong.

**Plumbers' Supplies** are in good demand, with prices firm all along the line.

**Galvanized Ware** has been advanced in price.

**Wrought Washers** were marked up 20c. per 100 pounds.

**Sash Weights** have been advanced \$2 per ton.

**Wire Nails** are more active; prices unchanged.

**Cut Nail prices** have been reaffirmed; movement is fair.

**Cordage prices** are irregular.

**Window Glass** is unchanged.

**White Lead** is in good demand at former prices.

**Linseed Oil** is weak and quiet.

**Spirits Turpentine** rules strong and is  $\frac{3}{4}$ c. higher.

**Old Rubber** is in good demand, with prices firm.

**Oakum** has been advanced  $\frac{1}{4}$ c. a pound.

## METAL MARKET.

NEW YORK, September 5, 1902.

**Pig Tin.**—Owing to heavy arrivals the market on Tin has declined sharply. The lowest point of the week was reached on Thursday, when sales of spot were made here at 27.05c. in wholesale lots. While a somewhat steadier feeling prevailed at the close, prices were considerably below the figures of a week ago, jobbers' quotations on Straits Pig in small lots being 28 $\frac{1}{4}$ c. to 28 $\frac{1}{2}$ c. per lb. The London market was also very weak and lower, owing to free selling by speculative holders. Business has been quiet, as might be expected under existing conditions. Shipments from the Straits for August were the heaviest for any single month during the last five years, amounting to 5200 tons. According to the statistics compiled by C. Mayer, secretary of the New York Metal Exchange, the visible supply was as follows:

|                                             | Tons.  |
|---------------------------------------------|--------|
| Total visible supply August 31, 1902.....   | 16,293 |
| Against visible supply July 31, 1902.....   | 16,809 |
| Against visible supply August 31, 1901..... | 16,327 |

**Copper.**—Weakness characterized the Copper market during the greater part of the week, but a firmer tone prevailed at the close. Prices, however, are still in buyers' favor. Lake Ingot in small lots rules at about 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c. per lb., and Casting Copper at 12 $\frac{1}{4}$ c. to 12 $\frac{3}{8}$ c. The statistics published this week show that on January 1 of this year the enormous supply of

135,524 long tons existed in this country. During the first six months of this year through heavy exportation and large domestic consumption this quantity was reduced by July 1 to 99,203 long tons. But through the decrease in exportation and smaller consumption during the month of July it is estimated that this quantity was increased by 5756 tons. According to this calculation, on August 1 the supply in this country was up to 104,959 long tons. As exports have been moderate and consumption has not increased here a further accumulation of at least 5000 tons is said to have taken place during the month of August. The statistics of C. Mayer, secretary of the New York Metal Exchange, show a total exportation of 11,469 tons for the month of August.

**Sheet Copper.**—The demand for Sheet Copper showed a slight increase during the week, and the volume of inquiry was referred to as very good. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—No change has been developed in the market for Lead. Prices are firm and business rather quiet. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices indicate an absence of new features in the Lead market at that point. The volume of demand and inquiry showed no increase and prices remained at the level of a week ago.

**Spelter.**—This metal is still very firm, with prices continually tending to advance. Spot metal is very well held by a New York concern who recently acquired a 1000-ton lot which had been held in reserve for about four years. The volume of business is limited, owing largely to the small offerings of spot metal. Jobbers quote good Western brands in small lots at 6 $\frac{1}{2}$ c. to 6 $\frac{3}{4}$ c. per lb. An important announcement is made in the trade to the effect that the Collinsville Zinc Company of Collinsville, Ill., who have been idle for about a year owing to low prices and the success of the concern in the gas belt will resume operations. The production of this plant will relieve the situation somewhat. Edward F. Byrne of 100 William street has been retained as sales agent for the company. It will be recalled that Mr. Byrne handled this well-known brand before the closing down of the plant. St. Louis advices indicate that transactions in the Spelter market are of moderately large volume, with prices firm and on the up grade.

**Sheet Zinc.**—The demand for Sheet Zinc is of the usual proportions. Prices are firm and unchanged at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—No change is noted in this metal. Cookson's in small lots is selling at 10c. to 10 $\frac{1}{4}$ c. per lb.; Hallett's at 8 $\frac{3}{8}$ c. to 8 $\frac{3}{4}$ c. and U. S. at 8 $\frac{1}{4}$ c. to 8 $\frac{1}{2}$ c.

**Nickel.**—Is unchanged. Small lots rule at about 55c. to 60c. per lb.

**Aluminum.**—The demand for Aluminum is referred to as good and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market, so far as large business is concerned, has remained dull and uninteresting with an absence of any important buying. The retail trade, however, seems to have picked up considerably during the week, jobbers reporting a comparatively brisk business as compared with that of recent weeks. The demand is materially larger for Roofing Plates than at the same season a year ago. The fact that more than half the capacity of the American Tin Plate Company is now idle has a tendency to check any material weakness in the Tin Plate market at the present time. Jobbers quote American Bessemer Coke Plates I C, 14 x 20, at about \$4.70 to \$4.90 per box, in moderate sized lots delivered at New York and corresponding points. The Welsh Tin Plate market has declined 1 $\frac{1}{2}$  pence, quotations being now 12 shillings 4 $\frac{1}{2}$  pence, Swansea.

**Sheets.**—The Sheet mills report a fair tonnage being placed in Black Sheets, but Galvanized Sheets have continued dull with some concessions in prices on the part of certain of the independent mills. On the other hand the New York jobbers report an improved demand for Galvanized Sheets, which in the last few days has compared favorably with the demand for Black Sheets. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at 3.60c. to 3.65c., and No. 27 Galvanized Sheets at 4.45c. to 4.60c.

Chicago advices are as follows: Galvanized Sheets are freely offered and easy, liberal discounts being granted to the local trade. The official prices from mill, however, are without essential change. In Heavy Sheets the demand is good, and even Light Sheets continue to meet with more favor. Quotations are as follows: No. 27 Black Sheets in small lots from store 3.45c. to 3.55c. Galvanized Sheets in small lots from store are sold at 4.55c. to 4.65c. for No. 27.

**Old Metals.**—Scrap Iron is in strong demand, which keeps full pace with the supply. Prices are very firm but not quotably higher. Old Brass and Copper are dull and weak. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                                        |         |                  |
|----------------------------------------|---------|------------------|
| Heavy Copper.....                      | per lb. | 10 c.            |
| Light and Tinner Copper.....           | per lb. | 9 c.             |
| Heavy Brass.....                       | per lb. | 8 c.             |
| Light Brass.....                       | per lb. | 6½c.             |
| Lead.....                              | per lb. | 3½c.             |
| Tea Lead.....                          | per lb. | 3 c.             |
| Zinc.....                              | per lb. | 3½c.             |
| Pure Aluminum Sheet.....               | per lb. | 22 c.            |
| Cast Aluminum.....                     | per lb. | 17 c.            |
| No. 1 Pewter.....                      | per lb. | 18 c.            |
| No. 2 Pewter.....                      | per lb. | 9 c.             |
| Tin Plate, per gross ton.....          |         | to \$5.00        |
| Wrought Iron Scrap, per gross ton..... |         | \$15.00 to 15.50 |
| Heavy Cast Scrap, per gross ton.....   |         | 13.50 to 14.00   |
| Stove Plate Scrap, per gross ton.....  |         | 10.00 to 10.50   |
| Burnt Iron, per gross ton.....         |         | 8.00 to 8.50     |

## THE PIG IRON MARKET.

**NEW YORK.**—Importations of foreign Iron continue, and some further cargo lots of English Foundry Iron have been ordered abroad. For large quantities Middlesbro can be laid down for shipment at about \$19. For spot lots considerably higher prices are realized, particularly in domestic, for which as high as \$25 to \$26 for No. 1 is paid. However, the quantities of domestic Iron for immediate delivery are so small, and each transaction is so much dependent upon special circumstances that no general quotation can be given. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity: No. 1 Foundry, \$22.25 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$21 to \$21.25.

**CHICAGO.**—Aside from an advance of 50 cents per ton in freight rates from the Southern furnaces to the Ohio River, no feature of importance has been developed in the Pig Iron market during the week. Difficulty still continues in obtaining sufficient supplies of Coke of desirable quality, which fact has caused much trouble to the furnaces and foundries. Poor deliveries of Iron following in the train of the fuel scarcity are sending more buyers into the market for Pig Iron for quick delivery, and the question of obtaining sufficient supplies of domestic Iron is becoming a more serious one from day to day. Some little foreign Iron is finding its way into this territory from the East, but direct importations have been inappreciable. Local Coke No. 1 Foundry for prompt shipment commands \$25 to \$26 per ton. Sales have been made for the second quarter of next year at \$23 at the furnaces. Single cars of No. 1 Southern Coke have been sold at \$27.65; No. 2 at \$27.15 and No. 3 at \$26.65, Chicago. Very few Southern furnaces will contract for the first half of next year, or for the second quarter under \$19 for No. 1, \$18.50 for No. 2 and \$18 for No. 3, Birmingham. The following quotations represent prices for the first half of 1903:

|                                   |                    |
|-----------------------------------|--------------------|
| Lake Superior Charcoal.....       | \$26.00 to \$27.00 |
| Local Coke Foundry, No. 1.....    | 23.50 to 24.00     |
| Local Coke Foundry, No. 2.....    | 23.00 to 23.50     |
| Local Coke Foundry, No. 3.....    | 22.50 to 23.00     |
| Local Scotch, No. 1.....          | 24.00 to 24.50     |
| Ohio Strong Softeners, No. 1..... | 25.50 to 26.50     |

|                                             |                |
|---------------------------------------------|----------------|
| Southern Silvery, according to Silicon..... | 23.10 to 23.50 |
| Southern Coke, No. 1.....                   | 23.15 to 23.65 |
| Southern Coke, No. 2.....                   | 22.15 to 22.65 |
| Southern Coke, No. 3.....                   | 21.15 to 21.65 |
| Southern Coke, No. 1 Soft.....              | 23.15 to 23.65 |
| Southern Coke, No. 2 Soft.....              | 22.65 to 23.15 |

**PHILADELPHIA.**—Immediate conditions in Pig Iron appear to be somewhat easier, due mainly to liberal arrivals from abroad. Consumers have about given up trying to get American Iron, and are decidedly less anxious about it since they have found good substitutes in the foreign article. Some of the Scotch brands are giving great satisfaction, and as they can be delivered promptly the feeling is much easier. As regards prices the market is just about as it was a week ago. Prices abroad are a little stiffer. This is offset by lower freight rates, so that sales are made at about the same prices as before. Cargo lots c.l.f. at about \$19 for Middlesbro No. 3, small lots, \$20 to \$20.50 alongside, or delivered in buyers' yards \$21 to \$21.50. Scotch Iron ranges from \$22.50 to \$23.50, and American at about the same figures as quoted in our last, for city or nearby deliveries during the first half of next year, as follows:

|                      |                    |
|----------------------|--------------------|
| No. 1 X Foundry..... | \$23.50 to \$24.50 |
| No. 2 X Foundry..... | 22.00 to 22.50     |
| No. 2 Plain.....     | 21.00 to 22.00     |

**PITTSBURGH.**—There is practically no Pig Iron market, the furnaces being sold up and consumers covered, many of them through the first half of next year. This applies particularly to Foundry Iron, and it would be hard to find a foundry that has not covered its requirements for all of this year and well into next. Nearly all the No. 2 Iron sold for delivery next year was on the basis of \$21.50 to \$21.75, Pittsburgh, but in exceptional cases higher prices were paid. No. 2 Foundry Iron for shipment over the rest of this year is held at about \$23, Pittsburgh. Some Middlesbro Iron has been sold at \$22.25, delivered Pittsburgh.

## CHICAGO REPORT.

**Scrap Iron and Steel.**—The offerings from the country have increased but little, and with a fair demand the market has remained firm. The following are the prices paid by dealers in carload lots, Chicago:

|                                                        | Per net ton.       |
|--------------------------------------------------------|--------------------|
| Country Wrought Scrap.....                             | \$15.00 to \$16.00 |
| Machinery Cast.....                                    | 14.00 to 14.50     |
| Malleable Cast.....                                    | 12.00 to 13.00     |
| Stove Plate (free from burnt).....                     | 10.50 to 11.00     |
| Burnt Iron and Grate Bars.....                         | 8.50 to 9.50       |
| Sheet Iron and Hoops.....                              | 9.00 to 10.00      |
| Plow Steel.....                                        | 13.00 to 13.50     |
| Breaking Stock.....                                    | 12.00 to 12.50     |
| Old Boilers—whole (Iron).....                          | 9.50 to 10.00      |
| Old Boilers (Iron) cut in single Sheets and Rings..... | 13.00 to 14.00     |
| Old Gas Pipe and Boiler Tubes.....                     | 13.00 to 13.50     |
| Cast Borings.....                                      | 9.00 to 9.50       |
| Turnings.....                                          | 12.50 to 13.00     |
| Horseshoes.....                                        | 13.00 to 13.50     |

**Old Metal.**—Further weakness has been developed in Copper and Brass, especially the latter, but Zinc and Lead have remained firm. Copper Bottoms, Yellow Brass and Yellow and Red Brass Borings are lower, dealers being less ready buyers. The following are the prices paid in this market:

|                            | Per lb. |
|----------------------------|---------|
| Copper Wire and Heavy..... | 10½c.   |
| Copper Bottoms.....        | 9½c.    |
| Copper Clips.....          | 10 c.   |
| Red Brass.....             | 10½c.   |
| Yellow Brass.....          | 7½c.    |
| Red Brass Borings.....     | 7½c.    |
| Yellow Brass Borings.....  | 7 c.    |
| Light Brass.....           | 6¾c.    |
| Pipe Lead.....             | 3.70c.  |
| Tea Lead.....              | 3.35c.  |
| Zinc.....                  | 3.45c.  |
| Tin Foil.....              | 21 c.   |
| Pewter, No. 1.....         | 18 c.   |
| Pewter, No. 2.....         | 11 c.   |
| Aluminum.....              | 20 c.   |

**Old Rubber.**—The offerings have not been excessive, and with a fair demand the market has remained steady. Dealers buy at the following prices. Chicago delivery:

|                            | Per net ton. | Per lb. |
|----------------------------|--------------|---------|
| Garden Hose.....           | \$25.00      | .....   |
| Air Brake Hose.....        | 45.00        | .....   |
| Rubber Shoes.....          | .....        | 7 c.    |
| Rubber Car Springs.....    | .....        | 7 c.    |
| Inside Bicycle Tubing..... | 22 c.        | .....   |
| Outside Tubing.....        | 5 c.         | .....   |
| Black Rubber.....          | 4 c.         | .....   |
| White Rubber.....          | 8½c.         | .....   |

**Rags.**—The market has ruled steady with a fair outlet and moderate receipts. Dealers are offering to buy

Country Mixed Rags at 75c. to 85c. per 100 lbs., Chicago delivery.

**Anthracite Coal.**—There has been a marked falling off in the demand for all kinds of Anthracite Coal, a feeling prevailing that the "strike" has reached its height and that a settlement will be effected soon. Local stocks are light and wholesale prices are nominal, there being few if any offerings of carload lots on track. In a retail way sales are being made at \$9 to \$9.50 per ton.

## THE HARDWARE TRADE.

With the vacation season practically over and the entrance on the fall months a quickening in business throughout the country is to be anticipated. Summer has given manufacturers less than the usual opportunity to accumulate stocks. In many lines they have been working on orders from which their books are not yet entirely cleared. The necessity for repairs and the regular overhauling of plants has of course interfered somewhat with production, and strikes and the difficulty in obtaining materials and fuel have also tended to reduce to no inconsiderable extent the quantity of goods available for the trade during the coming months. While there is a scarcity in some lines the jobbers are unquestionably well supplied with goods for the fall trade and some reports indicate that their stocks are unusually heavy. The goods in warehouses in connection with those ordered certainly show by their volume that a large business is anticipated. Owing to these conditions the demand upon the manufacturers and their representatives has been of late somewhat quiet, but it is now beginning to quicken. Prices are, as a rule, steady and strong. A few lines, owing to special conditions which affect them, are giving indications of slight weakness, which do not, however, cause any disquietude among the trade, who recognize the desirability of a gradual lowering of values rather than a sudden collapse in lines which are unreasonably high. While it is regarded as certain that there must come sooner or later a material decline in values, the date at which it will take place is being pushed further into the future by those who thought it might come during the season on which we are entering. In view of the more than satisfactory crop conditions, when the country as a whole is considered and the prosperity which prevails among the people in practically all sections, the outlook for business during the next few months at least is exceedingly promising.

## NOTES ON PRICES.

**Plumbing Supplies.**—The closing of the summer season in the Plumbing Supply trade has been marked by a considerable increase in the volume of orders received by the jobbing houses, both from the city and out of town trade. Prices show no signs of softening in any direction. On the contrary, an upward tendency is noted in more than one line of goods. The outlook is regarded as favorable for a large volume of business at a satisfactory margin of profit during the coming fall and winter season.

**Galvanized Ware.**—A revision of prices has recently been made by manufacturers of Galvanized Iron Ware, and as a result a number of advances are reported. Pails are quoted \$1 per gross higher, and on Washtubs an advance ranging from 25 to 50 cents per dozen has been made.

**Wrought Washers.**—An advance of 20 cents per 100 pounds has recently been made in the price of Wrought Iron Washers.

**Sash Weights.**—The condition of things in the Sash Weight market in the East is represented by the fact that an advance of \$2 per ton has recently been made in the New York market, the price now being \$25. Stocks in all the foundries are represented as low. The scarcity of fuel and the high price of raw material is the cause assigned for the higher prices now ruling in this line. The harmony which exists between the manufacturers is also an important element in the situation.

**Wire Nails.**—No reduction in the price of Wire Nails for the New York market was announced on the first of the month, notwithstanding the rumors that were circulated to that effect. Some increase in the demand is noted, and prices are maintained at \$2.25 to \$2.30 per keg for small lots from store.

**Cut Nails.**—Prices ruling during August were reaffirmed for the month of September by the Cut Nail manufacturers at a meeting held last week. It was the prevailing opinion that the cost of the raw material did not justify any reduction in the price of Nails. The local demand is confined almost entirely to Steel Cut Nails and is moderate. Small lots from store are quoted at \$2.30 per keg, New York.

**Cordage.**—A slight improvement is reported in the demand for Rope, which the manufacturers hope will have a steadying effect upon the market. Prices are irregular, owing to the lack of orders; also to the various mixtures which are on the market as Sisal and Manila Rope.

**Window Glass.**—Reports indicate that further steps are being taken with a view to harmonizing the Window Glass interests, with a possibility of success. Locally, business is very dull, as buyers are averse from placing orders until the future conditions of the market are settled. The Jobbers' Association quotation for Single and Double Strength Glass from store continues at 88 and 5 per cent. discount.

**White Lead.**—The consumption of White Lead in Oil in August was good, owing to the amount of indoor work which has been under way. Indications point to a continued active demand for the fall. Quotations are unchanged, American White Lead in Oil in retail quantities being quoted at 6½ to 6¾ cents per pound.

**Linseed Oil.**—Holders of resale Oil appearing to be fearful of a further decline in prices have been closing out their holdings at cost, the figures in some instances being 2 to 3 cents below present quotations. This has had a depressing effect upon the market, and together with an estimated crop of new seed of over 30,000,000 bushels, is calculated to cause a further reduction in prices.

**Spirits Turpentine.**—The market for Turpentine has been quiet but firm. Purchases are confined to small lots in the local market. Prices are strong and about ¾ cents higher than a week ago, owing to the firmer position of Turpentine in the South. Turpentine in small quantities is now quoted at 48 to 48½ cents per gallon.

**Old Rubber.**—A fairly good business is reported, with prices steady. Dealers in New York and vicinity are paying about the following figures:

|                                           |                |
|-------------------------------------------|----------------|
| Car Springs, ton lots, per lb.            | .....5c.       |
| Rubber Shoes, less than carloads, per lb. | .....6¾ to 7c. |
| White Wringer Rolls, per lb.              | .....7c.       |
| Inside Bicycle Tubing, per lb.            | .....21½c.     |
| Outside Tubing, per lb.                   | .....5c.       |

**Oakum.**—The manufacturers of Oakum have advanced their prices ¼ cent a pound.

## TRADE NOTES.

C. ROBERT CHURCHILL, 407 Morris Building, New Orleans, La., is reported to be organizing a company to establish a galvanizing plant in that city.

THE annual meeting of the Dairymen's Mfg. Company of New York will be held on September 12 at their office, 6 Harrison street, New York City. The Board of Directors of the company have declared a dividend of 7½ per cent. out of the surplus net earnings prior to August 1, 1902.

THE BURLINGTON BRASS COMPANY, Burlington, Wis., have been organized for the manufacture of Brass Goods and Brass Specialties of all kinds. The new company are erecting a Brass foundry and machine shop. They have organized by the election of G. C. Bush as president, O. O. Storle as vice-president and John P. Gill as secretary and treasurer.

THE A. GARRISON FOUNDRY COMPANY, manufacturers of Rolling Mill Machinery, Chilled Rolls, &c., have completed plans for the improvement and extension of their works on Ninth and Bingham streets, South Side, Pitts-

burgh, which will about double their present capacity. They have just completed a 67-foot extension of their machine shop, and installed a 25-ton electric traveling crane. A new power house will be built and a new foundry, also a three-story building, 48 x 120 feet, for use as a pattern and carpenter shop and for storage purposes. The entire plant will be operated and lighted by electricity.

THE plant of the South Bend Brass & Bronze Company, South Bend, Ind., has been purchased by Joseph Bergan & Co., who will operate it in the future.

WINTER BROTHERS COMPANY, Wrentham, Mass., are distributing an illustrated catalogue and price-list devoted to the Thistle brand of Taps, Dies and Die Stocks.

A MEETING of the Phoenix Galvanizing Company of Pittsburgh was held on August 31 for the purpose of reorganization and to wind up their affairs. The company will be succeeded by the Phoenix Galvanizing & Mfg. Company, which will be conducted under the present management.

POLLANSBEE BROTHERS COMPANY, Pittsburgh, Pa., are sending to their friends a blotter bearing a calendar for the month of September, together with a picture in colors of a small girl gathering golden rod, suggestive of the waning of the year. In one corner is a portion of a map of Pittsburgh, showing the location of the company's new offices and warehouse at Liberty and Short. Second and Third avenues, with an invitation to the trade to come and select their supplies of Tin Plate, Sheet iron, Copper, High Grade Roofing Tin, &c.

THE R. E. DIETZ COMPANY, 99 Lighthouse street, New York, are calling special attention to their Dietz Junior Dash Lamp, which is the smallest size of Cold Blast Dash Lamp made. The manufacturers claim that this Lamp gives a fine light and is absolutely wind proof. It can be used as a Hand Lamp, Dash Lamp or Wall Lamp. The company have issued a new catalogue, No. 33, which will be sent to those desiring it upon application.

J. C. PAUL & Co., manufacturers of Polishes and Enamels, now occupy offices at 57 Dearborn street, Chicago. Formerly the offices were located on Randolph street. The factory still remains, as in 1887, on Roscoe street. The firm announce that the full capacity of the manufacturing and shipping departments has been taxed to keep pace with the orders received during the season. The firm manufacture nine specialties in liquid and paste form, but among the Polishes designed specially for metals they call particular attention to their brand of Burnishine, which is said to contain no acids or chemicals injurious to any metal or to the hands.

It is reported that U. S. Fletcher of Bellaire, Ohio, and others are organizing a company with a capital of \$60,000 to establish an enameling and stamping works at or near Wheeling, W. Va.

THE MORSE-STEWART COMPANY of Portsmouth, N. H., have been incorporated with a capital stock of \$50,000 to manufacture Refrigerators.

### The American Bicycle Company.

After a threatened receivership had been anticipated for some weeks, R. L. Coleman, president of the American Bicycle Company, announced on September 1 that proceedings had been initiated to place the company temporarily in a receivership for the purpose of reorganizing their affairs. This announcement followed the news that the company had defaulted the semiannual interest on its 5 per cent. gold debenture bonds which became due September 1. The failure is attributed entirely to inadequate working capital which the officers of the corporation say has crippled them from the start. The business of the company is said to have never been better than now in their various departments. R. L. Coleman and Colonel Albert A. Pope have been appointed as the two receivers of the company by Judge Kirkpatrick of the United States District Court of New Jersey. The statement is made that the company are perfectly solvent and undoubtedly have an assured future. They control about 70 per cent. of the bicycle output of the United States and have an increasing and profitable automobile business in electric, gasoline and

steam vehicles, as well as a growing and promising trade in storage batteries, for the manufacture of all of which goods they are exceptionally well equipped. It is confidently expected that the proposed reorganization of the corporation will furnish the necessary funds for the proper conduct of their business in the future.

### The American Brazing Company.

The American Ferrofix Company have been incorporated in New Jersey under the name of American Brazing Company, offices and works at 532 West Twenty-second street, New York. The new company, with a capital of \$2,000,000, propose to engage in the business of brazing metals and in the introduction of a preparation used for this purpose.

Their process, which is particularly useful for brazing cast iron, consists in the employment of a compound which is spread upon the broken surfaces of the casting. The parts are then brought together and heated under a blow pipe, if small, or over a coke fire, if large, to a bright red. The effect of this is to decarbonize the iron in the immediate neighborhood of the break. The heat being continued the joint is brazed with brass in the usual way. The union is perfect, and as the brass alloy possesses greater strength than the iron itself the joint is better able to resist strain than any other part of the piece of like sectional area. The process has been successfully applied to the mending of broken pulleys, teeth of gears, frames of all kinds, press housings, &c. It is claimed that any cast iron piece which can be heated properly can be repaired successfully.

# September 30

Grasp the opportunity now almost out of your reach and get a good technical education. The

## FREE SCHOLARSHIPS

which through the generosity of the founders we have been able to offer, are almost exhausted, and on the thirtieth of September the offer will positively be

## WITHDRAWN.

Applications for the few remaining Scholarships will be considered strictly in the order received, and none postmarked later than September 30th will be accepted. Students can be enrolled after that date only at our regular tuition fee (\$50.00).

The opportunity of a lifetime for ambitious young metal workers to get a thorough knowledge of Mechanical Drawing as applied to their trade. The intersection of solids and the development of surfaces are illustrated by hundreds of practical problems, making the work of laying out patterns in sheet metal easily understood.

The course in this subject has been prepared, and is in charge of a thoroughly practical sheet metal worker with years of experience.

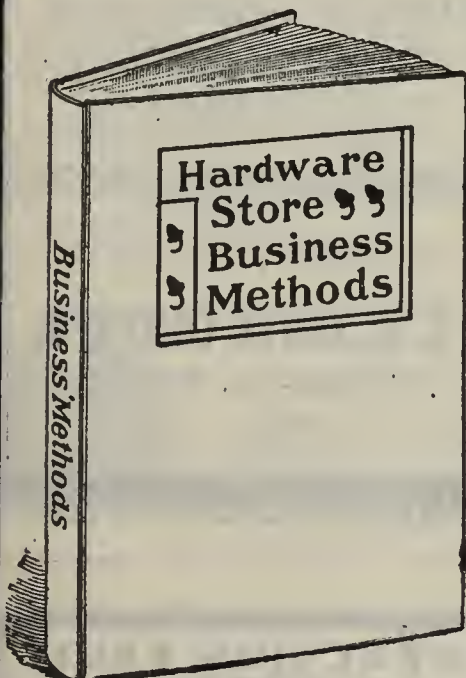

Successful applicants will have no expense, except postage and text-books.

Courses are given in Sheet Metal Pattern Work, Mechanical, Electrical, Stationary, Locomotive, Marine and Textile Engineering, Heating, Ventilation, Plumbing and Mechanical Drawing. Thorough instruction in Mechanical Drawing is included in each course.

† Examination credits count towards degree at resident technical schools.

† Handbook, describing courses, methods and regular terms, sent on request.

AMERICAN SCHOOL OF CORRESPONDENCE, BOSTON, MASS., U. S. A.

## Are You Studying Your Best Business Interests ?

### Hardware Store Business Methods,

now in its third edition, enlarged, is a useful hand-book for dealers, giving the most practical kind of information on store management, and treating subjects in which every hardwareman is vitally concerned. The book contains descriptions of methods successfully adopted by enterprising hardware merchants, and is designed as a guide and assistant for the merchant, the buyer, the salesman and clerk.

THE RANGE OF SUBJECTS IS INDICATED IN THE FOLLOWING LIST OF CHAPTER HEADINGS:

Rules and Regulations for the Hardware Store. The Hardware Buyer. Good Buying. Hints for Buyers. Securing the Correct Charging of Goods Sold on Credit. Conducting Sales to Avoid Oversights in Making Charges, Credits, etc. A Broad View of Stock Taking. Good Methods in Stock Taking. Suggestions in Regard to Inventory. A Price Book and Stock Directory. Prices and Catalogues. Arrangement of Catalogues and Price-Lists. The Accumulation of Dead Stock. The Treatment of Clerks. Waste in the Store and How to Avoid It. Keeping the Stock in Shape. Collecting Accounts. The Retail Hardware Merchant's Collections. Changing a Credit into a Cash Business. Sales Record of Cook Stoves. The Merchant and His Employees. How to keep the Store Neat and Clean. Cost Marks. Averaging Retail Profits. Changing Business Conditions and How to Meet Them. Starting in Business. Profit Figuring System.

### The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

**M F**  
**Roofing Tin**

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This **MF** mark stamped on every sheet. Ask your roofer, or

Write W. C. CRONMEYER, Agent,

THE ONE WITH THE SULKY OR THE ONE WITH THE WAGON?

The dealer who handles

**BERGER'S**

*BERGER'S*  
**Classik**  
METAL CEILINGS

**CEILINGS**

for business the dealer with the wrong line is hauling too heavy a load. The Berger line would help him to be a winner; to get more business and with less effort; to please his customers better and more easily hold their trade.

Why? Because the Berger designs are greater in variety than others; deeper stamped and more artistic and have constructional features that simplify their erection and reduce the number of joints.

Don't be handicapped by a poor line of Metal Ceilings—get in the race—write us at once for details.

**SPECIALTIES:**

96 inches long.

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron.

96 inches long.

**CORNICE MAKERS' SQUARING SHEARS.** With Lever Arc, Automatic Gauge. Will cut No. 2 iron 97 inches long.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, flanges and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel  $\frac{1}{2}$  inch thick, cut off and mitre angle iron  $\frac{1}{2}$  inch thick, and do it perfectly.

# ROUND OAK

## Standard of America

The Manse.  
**FIRST PRESBYTERIAN  
 CHURCH,**

Cannonsville, N. Y.,  
 May 16, 1902.

*Estate of P. D. Beckwith,*  
 Gentlemen:

After using the Round Oak  
 furnace one winter  
 I want to testify to its merits  
 Mr C. T. Jester, our local dealer,  
 placed one in the Manse last Fall.  
 All those who saw the furnace  
 before it was placed  
 said it would be  
 an expensive luxury  
 because of its size  
 and it was with fear and  
 trembling that I began to  
 use coal; but—  
 I have been agreeably surprised.  
 We have heated  
 one-third more space  
 than I did last winter  
 and my coal bill has been  
*less than half.*  
 No praise for the  
 Round Oak furnace  
 can be too strong.

Yours truly,  
 Rev. T. S. Rush.

Economy, that is what we  
 preach, and guarantee the  
 Round Oak to prove. Think you  
 could sell the highest class  
 furnace manufactured, in your  
 territory? if so, communicate.

*Estate of*  
**P. D. BECKWITH**

Dowagiac, Mich.

# Moore's Ranges

THE PRIDE OF THE BRIDE—A new home completely furnished with every convenience is sure to have A MOORE'S STEEL RANGE in the kitchen. Not only the reputation of these ranges with previous users, but their neat attractiveness and handiness—which appeal to both the eye and the good sense of the buyer—insure this selection.

—The illustration is from a home recently furnished with Moore's Premium No. 268 Reservoir and Closet.

JOLIET STOVE WORKS, Joliet, Illinois,

HOLBROOK MERRILL & STETSON,

San Francisco, Sacramento, Los Angeles.

# GOOD WILL

## "UNION MADE"

# STEEL RANGES

We have combined all the latest improvements, such as Large Feed Door, Duplex Grates which can be removed without disturbing the linings or waterfront, Large Ash Pit Door, and Deep Ash Pan, which is so arranged that it catches all the ashes. The Smoke Box is made of cast iron, as also the Enamelled Reservoir and Reservoir Casing, which is one of the very important features in Steel Range building, as experience has shown that the dampness from the reservoir soon rusts out the heretofore sheet iron flues or casing. The Fire-box Linings are sectional. The Ovens are thoroughly braced, and the Bodies are fully lined with asbestos Mill Board protected with an inner plate and are boiler-riveted throughout.

## Monarch Ventilator No. 164.

### A CALORIFIC WONDER.

Improved for 1902 by the substitution of **cast iron** fire-box section in place of sheet steel, the intense heat generated making this necessary.

Two 15-inch burners, with four rows of gas orifices in each, produce a terrific fire which quickly sets the incandescent brick clinkers to glowing, and the MONARCH Ventilating and Radiating System of pipes combine to make this the equal of a **hard coal base burner**.

# The Cooper Oven Thermometer

The First, Best and only thermometer ever used on stove oven doors which is of any real value to those who do baking. This is no loose advertising talk, but statements easily verified by facts.

Many of them have been in constant use thirteen years, and many thousands of them from eight to ten years. Used by over forty manufacturers of the highest grade ranges in the U. S. and Canada.

FULL SIZED CUT OF DIAL.

Since the use of the Cooper Thermometer has shown the necessity for such an instrument on oven doors, within the past five or six years there have been some half dozen devices put on the market called oven thermometers.

They do not deserve to be so-called.

Their bad working is depopularizing the name of oven thermometer with the public, who do not understand the difference between them and a good one.

Fortunately, unlike a watch, their value can easily be known by their faces.

Twenty degrees difference in the temperature of an oven, is sufficient to make "good luck," or "bad luck" in baking many kinds of food.

Unless an oven thermometer will plainly indicate such change, by a movement of the hand sufficient to be easily seen, such thermometer is positively worthless, by which to regulate the fire and heat of the oven. An attempt to use them for that purpose only produces disappointment and disgust, more or less of which attaches to the stove on which they are used. Between normal temperature, and extreme baking heat, there is a difference of 325 to 400 degrees. If for such a change of temperature, the whole movement of the hand of an oven thermometer is only two or three inches, it is plain that with a change of 20-30 or even 40 degrees, the movement of the hand would be too slight to be noticed by those who usually do baking, at least without a magnifying glass, which is not commonly used in a kitchen. The hand on the Cooper thermometer moves over six inches with such change of temperature, plainly shows a difference of 8 or 10 degrees in the heat of the oven, and even 2 degrees can easily be seen, by a slight knock on the oven door.

Next to good working durability is the most valuable quality in an oven thermometer. Thirteen years of satisfactory working is a very good record for the Cooper thermometer. Not being obliged to increase the radius of the hand in order to give it sufficient movement to be noticed, the dial on the Cooper thermometer is only as large as is necessary to be plainly seen by those using it, thereby making the danger of breaking much less than if it had a larger diameter. Those who use them do not say they "Do not think an oven thermometer amounts to much, anyway." The most common expressions of those who use the Cooper thermometer, is "I would not try to keep house without my oven thermometer," or "I don't know how I ever got along without it."

It is easily adjusted to either a swing or drop door, and is the best selling point ever put on a stove or range. However highly it is praised by the seller, it is more than verified when used. Do not buy a worthless article because it can be bought for a few cents less. It is sure to be far more costly in the end. An honest tile is preferable to a "make-believe" oven thermometer.

The price of the Cooper thermometer is very low indeed, when cost and value are considered. Every thermometer carefully adjusted, and tested by heat, before sending out.

# Once We Sell, We Win,

because what we furnish is so much better than we picture it that dealers feel they have a furnace that will bring trade, make friends and advertise them. Furnaces can be cheapened by reducing weight and quality, but this cheapening process usually increases the cost of fuel, necessitates repairs and kills the

# REPUTATION

of the dealer who recommends such cheap furnaces. We aim to secure efficiency first, with economical use of fuel, and then as reasonable price is made as such features will allow. To burn soft coal a furnace must be rightly constructed, must supply air at the places and in the quantities that the combustion requires. If our Standard Smokeless did not have decided merit it would not have so many imitators; but when it is compared the imitations are quickly seen to be counterfeits. This furnace burns soft coal without smoke, soot, or gas, and without damage to the castings. Dealers who have tried it continue to use it, and have used it for years. Dealers who do not know it are neglecting excellent opportunities for profit.

## WHEREVER SOFT COAL IS USED

this furnace will be thoroughly appreciated.

## ITS CONSTRUCTION IS OPERATION IS PRICE IS RIGHT.

**EFFICIENCY** in operation,  
**ECONOMY** in fuel and  
**DURABILITY** are most desirable  
features in a furnace, and this fur-  
nace has all these features.

**White, Warner Co., Taunton, Mass.**

# BOYNTON'S "RENOWN"

## PORTABLE FURNACE

**A** NEW and distinct type of construction thoroughly tried and tested. Possessing more area of heating surface to area of grate surface than any other furnace manufactured.

Notice construction of cast iron heating flues, each one directly over and in contact with fire. Can we mail you catalogue and prices?

*The* **BOYNTON FURNACE CO.,**  
NEW YORK. CHICAGO.

### Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

*The Front Rank Fire Chamber* is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

## THE NATURAL OUTCOME

Given honest motives and exceptional facilities and you can accurately forecast the outcome. That's exactly the case with

### "Gurney" Heaters

400 SERIES, DORIC, and BRIGHT IDEA

Only one motive ever influences us, viz.—to PRODUCE THE MOST DURABLE, MOST EFFICIENT HEATER. And that motive is reinforced by every needed facility,—the right kind of material, of workmen, of tools and experience. So the outcome is just what you'd naturally expect: long wear, small fuel consumption, an abundance of heat and easy operation. And it's these features, combined with prices no greater than those of inferior makes, which account for its attractiveness.

You ought to share its profits as well as other dealers. Can we not arrange an agency? Write us to-day.

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel.

The general type of construction is exactly the same as the regular "DIGHTON" which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once.

The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the fire is thoroughly cleaned.

If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

**DIGHTON FURNACE CO., Taunton, Mass.**

Established 1850.

## OUR REPUTATION

We've been making high grade heating apparatus for 52 years, until the name "THATCHER" has now a well defined meaning for individual merit. It stands for unrivaled construction and efficiency in operation. It means a better value and a stronger guarantee for the dealer—*things backed by a half century reputation.*

**A**TOMS of heat make degrees of temperature in a house. Every degree of temperature conserved by the utilization of heretofore wasted heat means added weight to the side of economy on the balance of expenses. The cause which produces these effects is the COLUMBIA RADIATOR.

A radiator which utilizes the most heat, which is neat and compact and which is so constructed as to be most easily cleaned, is sure to prove the quickest, readiest seller. We call your attention to the vertical system of tubes in the COLUMBIA which assures direct radiation, even distribution of heat and added facilities for ventilation, and which also assures the simplest, easiest method of cleaning.

We solicit your correspondence, knowing that offering you as we do a superior article at a price which places us in a class alone, when you place your order the COLUMBIA will command your attention. We do not offer an untried article, but one which has stood the test and proven itself a marketable product.

# Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tanners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

## PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

**Chapter I.—Furnaces**—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

**Chapter II.—House Heating**—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

**Chapter III.—The Combination System**—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

**Chapter IV.—Air**—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

**Chapter V.—Heating and Ventilation of Buildings**—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

**Chapter VI.—Heating of Public Buildings, Churches and Stores**—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

**Chapter VII.—Fan-Furnace Combination System**—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

**Chapter VIII.—Temperature Control.**

**Chapter IX.—Estimate and Contract Blanks.**

**Chapter X.—Value of Fuels.** The Proper Size for Furnace Chimneys—with tables.

## APPENDIX.

**Furnace Fittings.**—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

PUBLISHERS,

232-238 William St., New York.

# WOOD FURNACES

THE HOT BLAST.

Made With SINGLE PIECE Fire Box Body—

a practically indestructible casting, heavily corrugated to stand the strain.

HAVING IMMENSE AREA OF RADIATING SURFACE—

all directly exposed to the heat of the fire, giving great heating capacity even when fire is low.

MADE IN A WOOD SECTION,

where wood is burned practically—not theoretically.

Our IMPROVED MONITOR,

2 sizes, PORTABLE OR BRICK SET

Our Low Priced HOT BLAST,

sizes, PORTABLE OR BRICK SET.

Thousands in use in all sections of the country.

Send now for illustrated booklet giving full particulars and testimonials.

Wood & Bishop Co., Established 1839. 329 Main St., Bangor, Maine.

## MONCRIEF FURNACES

PORTABLE  
and BRICK SET.

*Unequalled in the Great  
Essentials---Simplicity,  
Durability, Economy,  
Capacity, Comfort.*

NO BETTER MADE.

Write for catalogue. Special price to the trade.

MANUFACTURED BY

The MONCRIEF FURNACE &  
FOUNDRY COMPANY, ATLANTA, GA.

## The Torrid Zone Furnace

is a trade winner because it has points of merit peculiar to itself that can be found in no other steel furnace. Our new catalogue is now ready to mail and a description of our Hot Air and Hot Water Combination Furnace can be seen in it. We furnish either the cast iron lining or the fire brick at the same price. Our Wood Furnace is called a powerful heater by those who use it.

## Pig Iron Production.

The troubles in the fuel supply had a marked effect on the production of pig iron during August. The monthly blast furnace statistics of *The Iron Age* show that, in spite of the fact that August counted thirty-one days, the output did not quite reach 1,500,000 tons, which is rather low for a long month. This amount would have been considerably exceeded had it not been for the short fuel supply. When coke and anthracite coal are once again regularly supplied it is safe to predict a monthly production close to 1,600,000 tons. The statistics of furnaces in blast on September 1, as compared with August 1, show a practically stationary rate of production. The total weekly capacity of the active furnaces at the beginning of the month is placed at 335,189 tons, a falling off of something like 5000 tons for the month. Meanwhile available furnace stocks are of the lightest, amounting to only 79,539 tons. A number of furnaces were blown out during August in various parts of the country, and several others were reported to be banked on September 1, while a few resumed operations in Pennsylvania and the South. On the seaboard consumers are now relying on regular supplies of foreign foundry iron, including some shipments from Canada.

## A Fee for Bids.

The custom of inviting several tradesmen to bid on a piece of work is a reasonable one which meets with the approval of all interested when practiced in a spirit of fairness. Whenever a piece of work is to be done those in charge of it naturally give some consideration to the ability of different tradesmen to complete the work should they be employed to do it. In consequence, a limited number, sometimes not more than two or three concerns with an established reputation, usually answer all the requirements of securing a fair competition for good work at a living price. Modern trade, however, has developed a custom which is unfair to the bidders and which imposes upon them an unnecessary expense. Not infrequently, particularly in large cities, bids are sought from every roofing, plumbing and heating contractor within reach, and in a number of instances when the bidders have met they have computed the time spent in making up the estimates and bids and found that the aggregate expense of preparing the bids amounted to more than the total cost of the work. This waste of energy, time and money expended in making up the estimate has led the Master Plumbers' Association of

Grand Rapids, Mich., to adopt a resolution for its members to make a minimum charge of 2 per cent. on the gross amount of each contract figured, whether from architects' plans or plans furnished by owners, except that no charge is made for this work by the contractor who secures the job. The effect of this resolution will be awaited with considerable interest by all who are invited to submit bids wherever they may be established in business. All the advantage of having a number of bids goes to the recipient of the bids, who should be willing to pay a small fee for the information the bids convey and the opportunity of comparing bids for the selection of the contractor to whom the work is to be given. This would seem to justify the effort to secure reimbursement for the expense of preparing such bids. The desirability of contractors being paid for this expensive work has been frequently discussed in different branches of trade, and should the effort of the Grand Rapids master plumbers meet with success there is little doubt that efforts will be made to establish the custom in other places and in connection with other branches of trade.

## Higher Cost of Building.

In view of the intimate relation of the building industry with the trades in which many of our readers are engaged, considerable interest will attach to the statement in the *New York Tribune* that the cost of building in the city has increased over 30 per cent. in the past ten years. In other words, a dwelling house that could have been erected for \$7000 in 1892 could not be duplicated to-day for less than \$10,000. One-half of this increase is credited to the higher wages paid to all classes of workmen in the building trades and the other half to higher cost of building materials. It is well known that wages in this industry have been advancing steadily of late years, until they are now, in some cases, nearly double what they were thirty or forty years ago. The following table shows the increase in wages for labor per hour, from 1869 to 1902:

|                                      | 1869. | 1879. | 1902. |
|--------------------------------------|-------|-------|-------|
| Bricklayers .....                    | 34    | 30    | 60    |
| Carpenters .....                     | 34    | 20    | 56    |
| Gas fitters.....                     | 25    | 30    | 50    |
| Hod carriers and other laborers..... | 21    | 17    | 37½   |
| Marble cutters.....                  | 32    | 25    | 55    |
| Marble polishers.....                | 20    | 17    | 44    |
| Masons .....                         | 34    | 30    | 65    |
| Painters .....                       | 27    | 25    | 44    |
| Plasterers .....                     | 39    | 30    | 62    |
| Plumbers .....                       | 27    | 30    | 50    |
| Roofers .....                        | 32    | 25    | 50    |
| Stone cutters.....                   | 34    | 30    | 55    |

It will be seen from the above that the cost of labor of every kind engaged in building operations has been augmented materially. Moreover, in many instances, in which wages are fixed by the day, the amount of work done has been curtailed by the cutting down of the length of the working day to eight or nine hours. Thus the condition of the artisan has as steadily improved as the burden on the employer has become more weighty. As a recent example, the journeymen carpenters in New York and vicinity demanded and received an advance in wages, from September 1, from \$4 to \$4.50 a day, while the hod carriers secured an increase of 2½ cents an hour from the same date. This increase of a few cents an hour for the various classes of labor, which has been

a constant occurrence in recent years, means the expenditure of many thousands of dollars more in the erection of a large building than would have been charged up to the builder under previous labor conditions. Prices for nearly all kinds of building materials are unusually high, structural steel, which is the most important item in the construction of the big modern fire proof structures, having doubled in cost since the beginning of this year. Moreover, there is a pronounced scarcity of steel, and delay in the receipt of this material is a common cause of complaint among builders and contractors, for such delays add materially to the expense of a job. Under the circumstances it is somewhat surprising to find that there is so much activity in building at the present time. Probably this may be due to the prevailing impression that costs are more likely to increase than to decrease in the near future. At the same time it is natural to infer that a considerable amount of proposed building has been deferred until costs are lower. Had the prices of labor and materials been reasonable this year there is every reason to suppose that the volume of building would have been enormously ahead of any other year in the history of the industry.

### The South African Market.

The importance of Africa as a market for the manufactures of the United States is illustrated by some figures just received by the Treasury Bureau of Statistics showing the commerce of the United Kingdom with Africa. Considerable satisfaction has been felt in the fact that the value of exports from the United States to Africa has grown to \$33,000,000 in the fiscal year 1902. But a comparison of these figures with those of the exports from the United Kingdom to that continent shows that our exports to Africa still form a very small proportion of the importations of the Dark Continent. The total value of exports from the United Kingdom to Africa in 1901 was \$157,000,000, or practically five times as much as the exports from the United States to Africa. Of this exportation of more than \$150,000,000 worth of merchandise to Africa, nearly two-thirds went to the southern part of the continent—namely, to Cape Colony, \$62,700,000, and to Natal, \$29,500,000. The next section in importance is Egypt, to which the exports from the United Kingdom were \$31,238,000, while British West Africa took \$13,222,000 worth of British products. That the current fiscal year will witness a rapid growth in the exportation of American goods to South Africa is practically certain. The expansion of trade in this direction has already begun, and with the gradual reconstruction and development of the Transvaal and Orange River territories, now under British rule, the demand for our manufactures in that quarter is likely to show a steady increase in the future. And with the development of the territories formerly administered by the Boer Republics will naturally go the opening up of the other large British territories and protectorates in that region, Mashonaland, Rhodesia, Bechuanaland, Swaziland, &c., all of which possess natural resources that will inevitably be exploited, attracting thither numbers of Europeans and Americans, whose needs and comforts will create a call for many of the manufactured products of this country. South Africa is a market worthy of close attention and earnest cultivation.

### THE ANTHRACITE MINERS' STRIKE.

The strike of the anthracite miners is now running through its eighteenth week. It has lasted much longer than had been generally anticipated, and is therefore developing numerous features of interest. It is growing to strongly resemble the strike of the Amalgamated Association last year in the mills of the United States

Steel Corporation. In both cases the main object of the strike was to secure recognition of the union. Other points involved were far less conspicuous and by no means sufficiently prominent to constitute real grievances. In both cases it was also assumed by the strike leaders that the stock market interests of the employers were of such magnitude as to impel a speedy settlement for fear of the demoralization of the price of stocks. Again in both cases the organization of workmen had gradually worked up to the possession of advantages which should have been deemed satisfactory for a considerable period of time or until some act on the part of the employers appeared to threaten the loss of a portion of what had been won. And now another point of strong similarity presents itself in the probability of an abrupt termination to the coal miners' strike by the act of their own leaders, who are reported to be on the point of calling it off for the purpose of saving their organization. There are always hot heads who talk of "last ditches and last crusts of bread," but their policy would be ruinous to the labor cause. They would lose the last vestige of an organization if they had their way, as men are going to work in such numbers that in the likely event of an early scramble for employment too few will be left outside to maintain it.

The leaders may deny it, but they must be seriously disheartened to think that neither Wall street influences nor political powers nor even the pressure of consumers has the slightest effect upon the attitude of the coal mining companies. Financial losses have not terrified them and threats of hostile legislation have not made them abate in the least the position originally taken by them. They have been abused by demagogues and lectured by the well meaning but misinformed in press and pulpit, yet have sturdily maintained the stand that they propose to manage their business and not have it managed for them. The public is being put to great inconvenience, important business interests are suffering, manufacturers are sadly hampered for lack of material, and in innumerable ways the strike is so affecting public and private interests that if it was possible ever to cause outside pressure to be invoked to end a strike it would in this case. But the operators maintain that they cannot yield to the men in justice to the interests they represent. It is now time for the suffering public to exert pressure on the strikers.

Some important lessons can be learned from the two great strikes of last year and this. Labor organizations can learn the lesson which may be of great benefit to them if they will heed it. That is that when great manufacturing or producing interests are confronted by a powerful labor organization it is not necessarily to be assumed that the latter can take the position of dictating terms. Convincing demonstration has been made that neither a possible decline in the stock market nor order books filled with profitable contracts will compel or induce unsatisfactory conditions to be accepted. A strike for labor supremacy has been shown by these occurrences to be most ill advised. It would have been far better for the Amalgamated Association last year or the United Mine Workers this year not to have placed themselves in such a position that a strike seemed to be necessary to preserve the appearance of consistency. When demands were refused and refused in a manner to indicate decision, it would have been well to withdraw them and wait for future developments. Big manufacturing corporations and big mining companies have shown themselves not so vulnerable as had been supposed. Another lesson taught by these two labor controversies, as well as by the building strike in Chicago in 1900, is the assurance that labor organizations will not yet be permitted to control the great business interests of the country. Such organizations have accomplished considerable benefit in various ways, but some developments have been of a character to cause serious apprehension lest such control of industrial affairs be secured as to break down the methods through which this country has developed its natural and mechanical resources and become pre-eminent among the nations of the world. It has been shown in three successive years that the employers of this country have the necessary grit to resist when aggressions are carried too far.—*The Iron Age*.

## GOOD FOR THE STOVE BUYER.

Notwithstanding the advance in the price of iron and the increase in the cost of everything that enters into the production of stoves, the market throughout the year has been a good one for the stove buyer. This branch of trade is again occupying the active attention of all engaged in it, and it is a matter of common knowledge that many of the stoves recently shipped were on orders taken in the early part of the year at prices prevailing at that time, previous to the advances in the cost of production that have since taken place. It is probable that reflection on the transactions of the year has prompted a well informed stove manufacturer to write us that some stoves and ranges are being sold at lower prices than they were selling at some time ago. Evidently this correspondent is dissatisfied with such a state of affairs and feels that the stove manufacturers should get together, as the manufacturers in other branches of the trade have done, and agree to secure a more profitable return for their product. For a long time past the general complaint of the trade has been that stoves are sold at too close a margin, and that there is no money in the business as it is being conducted. From the fact that no successful effort has been made to change the conditions the inference might be drawn that the prices of stoves are satisfactory. It is improbable, however, that such a conclusion would be agreed to by the majority of the manufacturers. If, as our correspondent states, stoves are selling at prices lower than good judgment would warrant, in consideration of the advances in the cost of production, there can be but one conclusion, and that is that it is good for the buyers of stoves. This, however, depends on the price at which the stove dealers dispose of their stock. If they, like the manufacturers, are selling their stock too low, the prices ruling cannot even be considered good for the stove buyer. It is to be hoped, however, that the fall season will be a satisfactory one in point of profit to the retailers, even if the manufacturers may feel occasion to regret the small returns on their business for the year.

## NOMINATIONS FOR STOVE CAPTAIN.

While some in the stove trade are quietly advocating the combination that has been so much talked about, there are others who have no hesitation of giving their views on the subject when their identity is not disclosed. Some of the latter have been moved to express their feelings in writing, and below we give the letter received from a manufacturer whose record is of the progressive type:

If the stove business needs a captain, and it would seem that it needed one badly, then what kind of a captain should it have? Look about and see the captains who have made a success of other large enterprises, and it will enlighten the average mind as to the quality of man needed. You will see men at their head who not only have been successful themselves, but who became so by being well grounded in every detail of their business. Men of broad and comprehensive minds; men who are encouragers of confidence; men who can be polite, pleasant and agreeable, yet shrewd, and whose word is carefully given, but when given is sacred and true.

Can we find such men in the stove business? Yes! lots of them. But there are more who lack the executive ability and wide comprehensive experience requisite in a man to place at the head of a stove consolidation than of those who have these and all the other necessary qualities, combined with this last and all important one: a man to whom honesty, integrity of character and self respect are of more consequence than money, yet whose energy is in the ultimate success of the business of which he is the head.

Grange Sard of Rathbone, Sard & Co. most truly possesses all of these qualifications, and as close seconds come Lazard Kahn of Kahn & Bro., George H. Barbour of the Michigan Stove Company and A. W. Walker of the Walker-Pratt Mfg. Company. These four men would lead the consolidation of the stove business to success and not only command the confidence of the people interested in the stove business, but that of the general

public as well. Grange Sard knows the details of the stove business from early life, and with his wide experience of the requirements of the different sections of the country, East, West, North and South, combined with that of Lazard Kahn, George H. Barbour and A. W. Walker, no section of the country would be neglected or suffer.

These four men are men of manly, broad gauge, high grade qualities, who now carry on large business interests and to whom the larger interest of consolidation would not be such a bound upward as to take away their breath or cause them to lose their heads. It would be more of a question of whether the consolidated interests could get them to serve in this executive capacity rather than whether those interests would have them. Such men are sought for, and as they know themselves what they are worth and what they can do, they will be found reluctant to rush into responsibilities of such magnitude. If consolidation comes may such men be at its head—men who are honest, good and true—is my earnest wish.

## FIRST ANNUAL MEETING OF THE AMERICAN STOVE COMPANY.

The first annual meeting of the American Stove Company was held at the offices of the Standard Lighting Company Division, Cleveland, on Monday, September 8, at which time the following directors and officers were elected for the ensuing year:

*Directors:* A. E. Ambs, John Ringen, E. C. Baxter, C. I. Dangler, D. Ed. Dangler, C. A. Stockstrom, E. H. Stockstrom, Louis Stockstrom, Geo. F. Fiske, F. L. Alcott, W. H. Boardman, Geo. M. Clark, H. J. Trenkamp, Henry Trenkamp, Sr., O. P. Moon, Paul Schneider and Kenneth K. McLaren.

The directors elected the following officers:

*President,* C. A. Stockstrom, St. Louis, Mo.

*Secretary,* H. J. Trenkamp, Cleveland, Ohio.

*Treasurer,* Geo. F. Fiske.

*Vice-Presidents,* Geo. M. Clark, F. L. Alcott and E. H. Stockstrom.

*General Manager, Cleveland District,* F. L. Alcott.

*Master Mechanic, Cleveland,* Paul Schneider.

*General Sales Manager,* E. H. Stockstrom.

*Assistant Manager, Cleveland District,* O. P. Moon.

The following were elected as managers of divisions:

Geo. M. Clark & Co. Division, Chicago, Geo. M. Clark.

Dangler Stove & Mfg. Company Division, Cleveland, Ohio, D. Ed. Dangler.

Monarch Stove & Mfg. Company Division, Mansfield, Ohio, E. C. Baxter.

National Stove Company Division, Lorain, Ohio, O. P. Moon.

Quick Meal Stove Company Division, St. Louis, Mo., Louis Stockstrom.

The Ringen Stove Company Division, St. Louis, Mo., E. H. Stockstrom.

The Standard Lighting Company Division, Cleveland, Ohio, F. L. Alcott.

The Schneider & Trenkamp Company Division, Cleveland, Ohio, Henry Trenkamp, Sr.

Twin Burner Vapor Stove Company Division, St. Louis, Mo., A. E. Ambs.

The capital stock of the company is \$5,000,000. A dividend of 5 per cent. was declared, \$50,000 was charged off from machinery and pattern account, and \$160,544.86 was passed to surplus, making the surplus account \$358,144.86.

A banquet was given to the directors by Messrs. Dangler at the Union Club on Monday night, and on Tuesday afternoon and evening they were tendered a banquet at the summer home of Paul Schneider, at Bedford, Ohio.

An attractive advertising novelty now being furnished their agents by the Michigan Stove Company is a tin whisk or broom holder, intended to be tacked in a convenient place. It is decorated in colors, has the Garland trade-mark on the front and is not only tasteful but highly ornamental.

## DEATH OF JAMES DUFFY.

The stove trade of the country will learn with deep regret of the sudden death of James Duffy, a pioneer stove manufacturer of Hannibal, Mo., which occurred a few days ago from heart trouble while on the lawn at his residence in that city. While he had been in poor health for something like a year, Mr. Duffy had not been altogether incapacitated for business and was daily found at his desk looking after the interests of the company with which he was so long identified. Just previous to his death Mr. Duffy had expressed himself as feeling much brighter than for some time past, so that his sudden taking off came as a shock to his many business friends and associates.

Mr. Duffy, whose portrait we present herewith, was born in Ireland, November 11, 1827, and came to this country with his parents when a child. He was indentured as an apprentice in the stove molder's trade in 1841, and began work as a journeyman in 1846. In 1853 he went from Troy, N. Y., to Quincy, Ill., as a stove

JAMES DUFFY.

molder in the foundry of what is now known as the Comstock-Castle Company, where he remained until 1863, when he engaged in business with Messrs. White and Bonnet. In 1866 the company were dissolved and Mr. Bonnet and Mr. Duffy built what was then the third foundry in Quincy. Mr. Bonnet drew out in 1884 and the Duffy-Trowbridge Stove Company were organized. About 15 years ago the foundry was removed to Hannibal, Mo. When the company were organized Mr. Duffy was made the president, which position he retained to the time of his death. His long experience in the trade and his keen observation resulted in his bringing out many improvements in connection with stove making. The goods which his company turn out have enjoyed an enviable reputation, not only locally, but through an extended territory.

Mr. Duffy was held in high esteem by all those with whom he came in contact, both in a business and a social way. One of the stove manufacturers of Quincy recently paid him a high compliment by saying of him, "He is a 'grand old man.' As England looked upon Gladstone as the 'grand old man' in politics, so the stove founders of Quincy look upon James Duffy as the 'grand old man' in the stove business." Mr. Duffy was a member of the Methodist Episcopal Church in Quincy and of Herman Lodge, A. F. and A. M., in the same city, having never transferred his membership in either to Hannibal. He leaves a widow and two daughters.

## Gas Stove Wrinkles.

An interesting feature of the meetings of the different associations of gas manufacturers is the presentation of explanations of practical methods of accomplishing anything of interest to the members that have been gathered by the custodian of the "Wrinkle Department" during the year. The following "wrinkles" were presented at the tenth annual meeting of the Pacific Coast Gas Association:

*An Adjustable Valve for the Regulation of the Gas Supply to Burners.*—The feature consists of a separate needle valve with which the gas orifice may be enlarged or reduced in order to mix the proper quantity of gas and air for perfect combustion. When the gas range has been set in a locality where there is a high pressure of gas, to reduce this pressure heretofore a governor has generally been placed at the meter to cut down the supply of gas. This has been found unsatisfactory, as by the use of the governor the velocity of the gas is cut down, making poor combustion at the burner. By this appliance, when the gas stove is set in place each burner is adjusted according to the pressure of gas, so that no matter whether the pressure is increased or diminished the burners operate satisfactorily and no waste of gas is experienced. Another advantage of this adjustable valve is that a servant can turn the valve wide open and not increase the consumption of gas. This idea was originated by one of the former members of the San Francisco Gas Company, and it has been used by them in all high pressure districts very successfully for a number of years.

*The Way to Connect Large Gas Ranges.*—The hotel and other large ranges having six burners or more on top, wherever the pressure of gas is not sufficient to have all the burners running in full force, by making a double connection from the service pipe—that is, by connecting the range with the service pipe at each end instead of at one end, as is usually done with regular gas ranges—it has been found that the efficiency of all the burners is largely increased. All gas ranges of large sizes are so constructed as to allow this double connection whenever it is found necessary.

*The Kind of Oven Burners to Use When the Pressure is Very Low.*—When the oven burners of a gas range go out after being lighted, from lack of a good supply of gas, by using drilled burners instead of sawed this difficulty is overcome in a great many cases.

## Some Adler Gas Stoves.

The fall and winter catalogue known as No. 36, which has just been issued by the H. Adler Company, with office and salesrooms at 241 First avenue, Pittsburgh, Pa., is an exceedingly attractive publication of 48 pages, bound in paper covers of rather unique design. The matter relates especially to the Acme, Lustre and Duquesne stoves and to the company's lines of gas ranges, cookers and ovens. The manufacturers have added many new and handsome designs to their already extensive assortment, and make the claim that they now produce the most complete line of gas appliances in the United States. One of the new designs is the Relda gas stove with closed cast front and center tube arrangement. It is made in three sizes and in the same number of styles of finish. The Acme gas radiator with heavy cast top and base is referred to as a new construction, and it is made in eight sizes. The Westminster and Tunis gas stoves have been improved for this season's trade, as have also the Continental and Yorktown, these latter being intended for using natural gas only. The Monogram is a new pattern of stove designed for using natural gas and is made in two sizes. Many other goods are illustrated and described, including an interesting assortment of fire place heaters and portable constructions. The closing pages of the catalogue are given up to some comments on hot air heating with natural gas as fuel; to illustrations of natural gas burners; polished brass and black iron fronts for natural gas fires, gas ranges, cookers, ovens, hot air plates, &c. The last page of the cover shows an exterior view of the offices and warehouse of the company as well as interiors of various departments of manufacture.

### The Tucker Vertical Grinder.

The need has long been felt among stove manufacturers and others for a machine that will grind castings vertically. To meet the demand for such a tool the Tucker Machine Company, 224 East Ninth street, Cincinnati, Ohio, have brought out the vertical edging and inside grinding machine illustrated herewith, the construction and operation of which are clearly indicated in the cut. The machine is provided with a tilting table 2 feet square, which can be set by the operator at any desired angle. The table has also a raising and lowering device which gives a range of 4 inches in either direction. The machine is also adapted for grinding the inside of circles, scrolls, &c., as it carries a wheel as small as 2 inches, and from 2 to 8 inches in diameter by 4 inches face. The countershaft has 14 x 3 and 8 x 3 T. and L. pulleys and is calculated to make 750 revolu-

*The Tucker Vertical Grinder.*

tions a minute. The height of the machine is 36 inches. It is specially designed for use in stove foundries, range works and similar manufacturing establishments.

### The B. C. Bibb Stove Company.

Bound in paper muslin covers and illustrating the leading lines of stoves, ranges, furnaces, fire place heaters, hollow ware, &c., which they manufacture, the B. C. Bibb Stove Company, Baltimore, Md., have issued an attractive volume of 120 pages. In the arrangement of the matter the order often followed by manufacturers has been departed from, and in the early pages skeleton cuts of a cook stove and a range are presented with the various parts numbered and accompanied by suggestions intended to facilitate the ordering of repairs and the prompt shipment of goods. General directions for setting and operating stoves and ranges are also given with a view to securing the most satisfactory results. Again, the cook stoves are first considered, instead of the ranges, the leading place being given to the Grand Emerald, an attractive construction made in three sizes. It is followed by the Stonewall, made in two sizes; the Severn, made in three numbers; the New Maryland, the Virginia, the Southern Girl and the Maxim, the latter being made in one size only, and intended for burning wood. A varied assortment of ranges is presented with the Tuxedo in the place of honor. This has six 8-inch boiler holes in the top surface, and can be furnished with or without water back, according to requirements. It is

followed by the Harford, a substantial range of attractive exterior, in which nickel plays a prominent part. Other goods include the Improved Maryland, the Newport, Cecil, Avalon, Arcadia, Athol, Oriole and Improved Daisy ranges, the two last named being intended for using coal exclusively. A line of steel ranges is also shown, together with double oven constructions offered in portable form and also for brick setting.

The heating stoves cover the usual lines, prominent among them being the Hemlock, a handsome oak for wood or coal; the Druid, a high grade modern air tight; the Wildfire, another air tight with end feed door; the Warwick, a square parlor stove which can be used as a single or double heater; the Magnum, a heavy low priced stove, together with other specialties in the way of box, Todd, cottage parlor and laundry stoves.

An interesting chapter describes the valuable features of the Bibb sanitary hot air furnace, which the company manufacture and for which very strong claims are made. It is offered in five sizes portable form and two sizes for brick setting. For many years the company have been noted as manufacturers of fire place heaters, and in the closing pages of the catalogue under review considerable attention is given to their specialties in this line. Reference is made to the Lombard improved fire place heater, embodying a novel arrangement of the interior flues; the Arundel, an attractive modern design with the latest improvements; the Capitol, with back reversible flues; the Radiant, which is referred to by the company as their smallest production in the way of a fire place heater, and the Grand Diamond fire place heater for hard or soft coal, which has been in the market for something over 30 years. A valuable feature in connection with the description of these goods is found in the diagrams showing the proper manner of setting Bibb's original Baltimore made fire place heaters. The catalogue concludes with reference to portable grates for open fire places, hollow ware and lists of fire brick for cook stoves, ranges, heaters, &c., as well as Tuttle & Bailey's registers and ventilators. The company also give a list of heaters and stoves which have been retired from the market but for which they can furnish repairs.

### A. J. Magoon & Son Enlarge.

A. J. Magoon & Son, 313 Weybosset street, Providence, R. I., have bought the stock, fixtures, patterns and good will of the King Erle Heater Company, manufacturers of the King Erle and Silver Lake furnaces. This business will be added to the former line of A. J. Magoon & Son and the manufacture of the King Erle heater continued. They have about completed a large addition to their premises on Chapel street, directly in the rear of the Weybosset street store and connected therewith. The addition gives them a frontage of 50 feet on Chapel street and is 50 x 75 feet, three stories, built of brick. It will be used as a warehouse, manufactory and storeroom. The total floor space, including basement, is about 15,000 feet. It is expected that the increased capacity will enable the firm to handle more promptly their large stove repair business, and will generally afford them better facilities for their entire line.

THE JOHN B. MORRIS FOUNDRY COMPANY, Cincinnati, Ohio, are sending out a special catalogue devoted to Furnace Repairs of which they carry a large stock. It is of a size convenient to carry in the pocket, and is bound in paper covers with muslin back. The Furnaces for which Repairs can be furnished are arranged with names in alphabetical order, each being followed by the name of the manufacturer, and the parts for which Repairs can be had, together with their weights. The company state that the unusual success which they have had in the past in promptly supplying perfect fitting Stove and Range Repairs caused them to decide to enlarge their field and add Furnace Repairs to their line. After months of preparation they announce that they are today in a position to supply Repairs to fit the leading Furnaces made in the United States, and will continue to add new patterns as fast as circumstances would seem to warrant.

### The Charles Smith Company.

We have received from the Charles Smith Company of Chicago, Ill., a copy of a 32-page catalogue and price-list which they have issued relating to the Hero furnaces and Smith's hot water specialties, which are made in an interesting variety. The furnaces are for different kinds of fuel; the Improved Hero being intended for soft coal or wood. It is constructed of cast iron with cup joints, deep ash pit and Smith's triangular revolving grate. The fire pot and dome are heavily corrugated, thus doubling the radiating surface and insuring greater durability. The radiator is made in two parts and connected by means of a rib joint, giving it greater strength to resist unequal or sudden expansion. It is also mounted in such a way as to avoid the possibility of gas leakage. Another form of the Improved Hero has revertible double flue radiator, and is intended for burning hard coal. Smith's Cast Hero, 200 Series, is intended for using hard coal or wood and embodies features which cannot fail to attract the attention of the trade. Another member of this series is designed for burning soft coal or wood and the flues are constructed especially with a view to using soft coal. Another specialty is the Hero room heater, intended more specially for schools, churches, public buildings and stores which have no basements, also for halls and auditoriums located on upper floors. Still another specialty to which attention is invited is the new Hero combination hot air and hot water heater, in which the radiator has revertible flues so that the products of combustion are forced to pass to the front ends of the radiator and return to the center before reaching the smoke pipe.

The latter half of the catalogue is taken up with illustrations of Smith's hot water specialties, which include the Little Giant, made in four sizes, and which can be placed in any furnace; the Circular Giant, made in six sizes, from 14 to 24 inches, and intended to heat from one to eight rooms with hot water; the Maltese heater, which can be used in any surface burning stove or furnace, and two or more of which can be coupled together, and Smith's laundry water heater, which, as the name indicates, can be used in any laundry stove. Reference is also made to the Porcupine water heater for gas, Ideal registers and miscellaneous goods. Several of the illustrations are full page and represent vertical sections through city houses, one showing Smith's Little Giant connected to two radiators and expansion tank, another showing Smith's Giant connected to two radiators and flushing tank for expansion, while a third shows the water heater connected to two radiators, also supplying hot water for domestic purposes.

### ODD PLATES.

GEORGE M. CLARK & Co., 73 Lake street, Chicago, manufacturers of Jewel Gas and Gasoline Stoves and Chicago Jewel Steel Ranges, have just completed the decoration of their sample rooms and offices. The colors employed are cream white with cherry red trimmings, the combination being particularly striking and pleasing. The sample Stoves exhibited now appear to much better advantage. This company report a very substantial demand for their Chicago Jewel Steel Range, which is one of this year's production. It is meeting with much favor at the hands of the trade, and the indications are that it will prove to be one of the company's best sellers. A very striking muslin sign is being sent by this company to their customers. It is printed in three colors—red, yellow and black—and is adapted for either inside or outdoor display.

THE employees of the Quick Meal Stove Company, St. Louis, Mo., have organized a sick benefit fund, which has been incorporated under the laws of the State as the Quick Meal Employees' Mutual Aid Association.

THE CHAMPION STEEL RANGE COMPANY of 131-137 Viaduct, Cleveland, Ohio, are sending out a ten-page folder calling attention to the merits of their Champion and Marquart Steel Ranges, for which strong claims are made. The goods are offered in the usual modifications and in three finishes—japanned, polished steel or

Russia iron. The constructive features include pouch feed, cast reservoir, which is detachable, elevated warming closet and patent double flue hot blast, which it is claimed saves one-third in fuel. The nickeling is done on copper, which makes two thicknesses and is said to give a much better finish. One size of the Marquart is intended for hotel use, it having ten boiler holes in the top surface and is provided with double ovens.

THE PENINSULAR STOVE COMPANY, Detroit, Mich., are making the Winner Peninsular four-hole Wood Cook in several sizes and with ovens measuring 15, 16, 17, 19 and 21 inches respectively. The Stove is made with Never Break steel base, two piece-oven bottom, which will not warp or crack; Never Break steel oven rack, capacious fire box with large feed door, cemented oven top, smooth swing hearth, loose bottom grate and swing front grate. A written guarantee is given with each Stove. A leaflet which the company are distributing intimates that dealers ought to be interested in Peninsular goods.

THE WALKER & PRATT MFG. COMPANY, Boston, Mass., have issued what they term the "Heating Stove Number" of the *Crawford News*, which they occasionally publish in the interests of their leading specialties. The front page shows an old Heating Stove which they say may be 100 or perhaps 150 years old, which came from down Amesbury way and is, of course, made for burning wood. This relic of ancient days is on exhibition in the company's office, and interested visitors at the Hub are invited to call and see it and compare it with the company's latest Heating Stoves. The second and third pages of the *Crawford News* are devoted to a statement of the leading features of the Crawford Oak and the Cosy Crawford, the latter being a sheet iron surface burner with ornamental cast front. The last page is entitled "Antiquity," and answers questions as to the length of time the company have been in business. Accompanying the copy of the *Crawford News* are several folders, one telling about Dampers of Cooking Ranges, another is entitled "Crawford Reasons," and the third, "What Good Cooks Say of Crawford Ranges."

THE SUN STOVE COMPANY, Detroit, Mich., are erecting a two-story addition in the rear of their plant on Bellevue avenue, which will be used for warehouse purposes. The contract for the work of erecting has been given to G. L. Seelbinder & Co.

A LEAFLET just issued by the Estate of P. D. Beckwith of Dowagiac, Mich., calls attention to some of the leading points in Round Oak Steel Ranges, which are manufactured in great variety and adapted to meet many requirements. The Range is of handsome exterior and is intended for using coal or wood as a fuel. The body is constructed of Wood's hammered polished steel, and the parts are so put together that the Range will hold the fire for a long time, thus effecting a saving in fuel. The claim is made that the Range will bake like a brick oven.

THE S. M. HOWES COMPANY, 40-46 Union street, Boston, Mass., have recently issued a catalogue and price-list relating to heating. Confectioners' and Laundry Stoves, for wood and coal, also Portable Galvanized Ovens and Farmers' Boilers. The matter is neatly printed on good paper and bound in colored covers. The goods represent the lines handled by the company as well as those of their own production. Accompanying the catalogue are circulars relating to the New Process and Standard Oil Heaters, the Erie Hollow Ware and the Boston Stove Pipe and Elbows, for all of which the Howes Company are selling agents.

A STATISTICAL REVIEW of the commerce of the Philippine Islands for the year 1901, published by the Bureau of Insular Affairs of the War Department, shows that the total value of Stoves and Ranges imported into the islands in 1901 was \$4666, of which the United States furnished \$2042.

A FOUR-PAGE folder, issued by the Co-operative Foundry Company, Rochester, N. Y., illustrates the Economic and the Maple Leaf Steel Ranges which they are offering, adapted for hard or soft coal or wood. The Economic is a modern Steel Range embodying the latest features and is ornamented in a rich and effective manner. The Maple Leaf is a cheap Steel Range having

duplex grate, cast linings, good sized oven and six boiler holes in the top surface. An attractive Oak Stove, to which the manufacturers are calling attention by means of a leaflet, is the Model, made in four sizes with full size fire pots.

THE SIMPSON STOVE & MFG. COMPANY, Pittsburgh, Pa., are sending through the mails a card calling attention to the fact that this is the season when people are thinking about Gas Heating Stoves, and they raise the question if dealers have considered the contents of a catalogue relating to this class of goods which the company have recently issued. Special reference is made to the Simpson Multiple Action Stove, which embodies many interesting features of construction and which cannot fail to interest the wide awake dealer.

F. M. BORDEN & BROTHER, 118-127 North Second street, Philadelphia, Pa., are sending to the trade a postal card calling attention to their Ideal and Reliable Gas Ranges, and also inviting investigation of their extensive line of Gas and Oil Heaters. The house have given some attention to the selection of their line of gas and oil goods, owing to the increased popularity and demand for first-class constructions in this line.

THE S. OBERMAYER COMPANY of Cincinnati, Ohio, are having a series of leaflets and advertising novelties prepared to be sent to the trade each month. They have commenced the work by sending out blotters containing colored reproductions of paintings. They are also sending out a leaflet containing a reprint of P. R. Ramp's paper on "Economy in the Foundry," read before the Boston meeting of the American Foundrymen's Association. Another leaflet contains a treatise on Foundry Facings and Blackings.

THE TWIN BURNER STOVE COMPANY, 906-910 South Ninth street, St. Louis, Mo., are making the Twin Burner line of Steel Ranges with all the modern improvements and are offering them in a very attractive dress in which nickel plays a prominent part. A new catalogue which has been issued tells all about the goods and emphasizes the salient features. The company are selling agents for the Radiant Home Steel Ranges for Missouri, Southern Illinois, Kansas and Oklahoma Territory.

WHITE, WARNER COMPANY, Taunton, Mass., refer to the fact that the great heating capacity and long wearing powers of their Household Furnace are due to the brick lined, heavy wrought iron fire pot, combined with their own patent auxiliary horseshoe radiator. The company claim that with a Household Furnace the dealer is prepared "to meet the stiffest proposition that ever happened, and win."

THE UNION STOVE WORKS, 70 Beekman and 66-68 Gold streets, New York City, are offering the trade an extensive assortment of Cylinder Stoves, representing six different types and 63 varieties. One of the most attractive in the line of Globe Stoves is the Astor Gem, which is made in four sizes and with or without magazine. It is intended especially for heating offices, stores, railroad stations, restaurants, lecture rooms, chapels, club rooms, &c., and is finished in a way to render the Stove an ornament to the room in which it is placed. It is intended for burning any fuel, and the claim is made that even the self feeders make good wood burners by simply lifting out the magazines. The company manufacture a very large line of Heaters of all kinds, and they intimate that timid dealers who delay placing their orders this year are liable to disappointment in obtaining stocks of goods.

THE Good Will Steel Range, made by F. A. Klaine & Co. of Cincinnati, Ohio, combines the latest improvements, such as large feed doors; duplex grate, which can be removed without disturbing the lining or water front; large ash pit door and capacious ash pan. The smoke box is made of cast iron, as also are the enameled reservoir and reservoir casing, which is one of the important features in Steel Range construction. The fire box linings are sectional and the oven is thoroughly braced. The Good Will Range is of attractive exterior and is offered in the usual modifications.

THE STANTON HEATER COMPANY, Martin's Ferry,

Ohio, state that one of their customers placed such a high estimate upon their furnace that he has named his last son "Stanton" and calls a photograph, showing him with his son standing in front of the Heater, "The Three Stantons." The company have issued a catalogue relating to their goods and will send a copy thereof to any one on application.

A LETTER from D. G. Cooper, Pequabuck, Conn., includes the statement that the seed from which the popular oven thermometer grew was from a newspaper article that appeared in December, 1884, and his first patent was taken out in 1885, when the manufacture of the now well-known Cooper Oven Thermometer began. This Thermometer is attractive in appearance, satisfactory in operation, and through its popular service is well known not only to the Stove manufacturers and dealers, but in many kitchens. Mr. Cooper, through his advertising matter and circulars, has done much to explain the use and convenience of Oven Heat Indicators, so as to create a demand for them that has grown to some proportion recently.

THE HELIOS-UPTON COMPANY, Peabody, Mass., are sending to the Stove manufacturers a card cut to the size and shape of their Standard Oven Thermometer and bearing a picture of it, so that it is a good *fac-simile*, and being tied with a red ribbon, can be hung up for a reminder when the time for buying new stock arrives. By untying the ribbon a unique catalogue of several pages is disclosed.

### The White Mountain Freezer Company.

The White Mountain Freezer Company, Nashua, N. H., are making extensive improvements in and additions to their plant. During the past few weeks they have completed a new foundry to take the place of the one burned in July of last year. The building, which is of brick and steel, with slate roof, is 200 feet long by 50 feet wide, with all necessary rooms for tumbling and snagging castings, storage, &c. The foundry is equipped with a 64-inch Colliat cupola, and a No. 5 Root's blower of latest pattern. An addition to their brick tin shop building of 40 x 100 feet, three stories, has just been completed which will double the capacity of this department of the works. The company also have plans drawn for a new brick galvanizing and tinning building, 30 x 100 feet, with all latest equipments, and state that this building will be completed and in commission before October 1. With these additions to their already extensive plant the company claim their capacity will be increased about 50 per cent., so they will have no trouble in producing a sufficient quantity of freezers of their well-known brands to supply the trade promptly at all times.

### A New Gasoline Torch.

The Clayton & Lambert Mfg. Company, Detroit, Mich., are offering the new gasoline torch known as No. 36, of which we give an illustration. This torch is designed

A New Gasoline Torch.

for the use of mechanics who desire a powerful burner capable of doing heavy work out of doors in cold or windy weather. The makers state that the generator has great power and will produce a clear blue, intensely hot flame; is under perfect control of the operator and is economical in the use of gasoline. The tank is of

quart size, drawn out of heavy brass, free from seams. All fittings are heavy, reinforcements being used to make an extra strong tank. A brass air pump of the latest design screws into the tank and is submerged in gasoline, which aids in keeping it cool and also protects it from injury. The No. 36 torch is supplied in polished brass or nickel plated and is recommended as specially adapted for brazing the wires in rubber tires.

### L. & G. Galvanized Ware

The Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have recently expanded their line of galvanized sheet steel household ware materially. Here-with we present illustrations of a few of the goods now being offered by the concern. In Fig. 1 is shown a gal-

L. & G. Galvanized Ware.—Fig. 1.—Galvanized Washtub.

vanized wash tub, substantially made to withstand the exigencies of hard usage. These tubs are made in three sizes—namely, 20 x 11, 22 $\frac{1}{4}$  x 11 and 24 $\frac{3}{4}$  x 11 $\frac{1}{4}$  inches. They are provided with strong handles and are finished in the best possible manner. A galvanized Windsor dipper is shown in Fig. 2, the handle of which is securely

Fig. 2.—Galvanized Windsor Dipper.

riveted on the body. These dippers are made of  $\frac{3}{4}$ , 1 and 2 quart capacity. The pit bottom tea kettle, Fig. 3, is stamped in one piece and is of very durable construction. The kettles are made in four sizes of 4, 5, 7 and 8 quart

Fig. 3.—Galvanized Pit Bottom Tea Kettle.

capacity, with diameters at pits 6, 7, 8 and 9 inches respectively. Among the other galvanized goods made by the concern are coal shovels, steel baskets, garbage cans, chamber pails, water pails, foot tubs, trays, fire

pails, watering pots, refrigerator pans, dust pans, chambers, wash basins, measures, funnels, scoops, soap dishes, &c.

### Stove and Hardware Dealers.

E. E. WILLS has succeeded L. W. Snider & Son, dealers in Stoves, Hardware, &c., Exeter, Neb.

WAGNER BROS., Odessa, Mo., have disposed of the Stove and Hardware business which they have conducted for the past 19 years to Cable & Ferguson, who continue at the old stand.

THE COLUMBUS HARDWARE COMPANY, Columbus, Ga., have been succeeded by the Bush Hardware Company, who will continue the wholesale and retail business in Stoves, Tinware, Hardware, Agricultural Implements and Sporting Goods. The store is a new one, and is 50 x 300 feet in dimensions, two stories high.

CHAS. SCHUBER has purchased the Hardware and Tinware business of C. M. McMurray & Co., Geraldine, Texas. Mr. Schuber buys and sells for cash.

D. PHILLIPS & SON have lately embarked in business in La Harpe, Kan., handling Stoves, Tinware, Shelf Hardware and Sporting Goods.

MANCHESTER & GILL, Stove, Hardware, Harness, Sporting Goods and Furniture dealers, Skidmore, Mo., have been succeeded by Manchester, Gill & Dodds. They now occupy a room 50 x 60 feet, in addition to the one occupied last year. Since moving into the new building they have added furniture and undertaking to their former business.

F. L. BELZER has succeeded Belzer & Doss in the Stove, Hardware, Tinware, Farm Implement and Sporting Goods business in Rock Rapids, Iowa.

THE LELAND HARDWARE COMPANY have lately commenced business in Leland, Miss. The company have been chartered with a capital of \$10,000, the following being the officers: C. C. Dean, president; J. W. Thompson, vice-president, and J. A. Gary, secretary-treasurer and general manager. The line carried by the concern embraces Stoves, Shelf and Heavy Hardware, Crockery, Queensware, Wagons, &c.

KING & HEATH have purchased the Stove, Tinware, Hardware, Agricultural Implement, Sporting Goods and Wagon and Buggy business of C. B. Crawford, Shellsburg, Iowa.

P. F. WRIGHT & SON, Stove, Hardware and Farm Implement dealers, Wakita, O. T., have dissolved partnership, and the business is now being conducted by P. F. Wright under his own name. Mr. Wright has lately completed a new building for the accommodation of his Implement stock. It is 30 x 120 feet in dimensions.

CRANDALL & COON are successors to W. D. Crandall, dealer in Stoves, Tinware, Hardware, Agricultural Implements, Harness, Lime, Cement, &c., Leonardsville, N. Y.

J. E. NYE, dealer in Stoves, Hardware and House Furnishing Goods, West Union, Iowa, has recently disposed of his business.

A. O. DUNCAN has sold his stock of Stoves, Hardware and Farming Implements at St. José, Texas, to Dunbar & Johnson. The new owners sell strictly for cash, except in the Implement line, where well secured notes are accepted.

TRUE & BLANCHARD COMPANY, Newport, Vt., wholesale and retail dealers in Stoves, Hardware, Pipe, Fittings, &c., advise us that they would appreciate receiving catalogues and price-lists from manufacturers and dealers in Toys.

W. B. BERTELS, SON & Co., Wilkes Barre, Pa., are distributing blotters advertising their well-known Sun Dinner Pails. These are made in a number of sizes and styles. Special attention is called to the new spring ear which the company are putting on all their Pails, composed of a solid brass spring, which keeps the lid tightly in place.

## THE PLUMBERS' SUPPLY ASSOCIATION.

Some interest will attach to the deliberations of the different manufacturers of plumbing supplies this week, when the Association of Manufacturers and Jobbers of Plumbing Supplies held their quarterly meeting in New York. This meeting brought together manufacturers especially interested in the various lines of goods used by the plumber in constructing a modern plumbing system. It included those who are interested in the manufacture of brass goods, soil pipe, sanitary earthen ware, enameled iron goods and an infinite variety of specialties which go to make up the stock of the supply dealer. Their attention was given to the matters which affect the trade with a view to eliminating petty annoyances and such detrimental customs as are bound to creep into any trade, and to secure united effort for the betterment of all conditions that affect their interests. Notwithstanding that price is always a very important question, there are other factors in the transaction of a business in which dollars and cents do not come up so prominently to the buyer and seller and which have a most important bearing on the cost of carrying on a business and the profit and loss account at the end of the year, and these were discussed. Apparently the trade, so far during the year, has been transacted without anything more interesting cropping up than the relations between the wholesale and retail trade, and while there exists some difference of opinion between the plumbers and the supply houses as to the extent of the protection given the trade, it is not of sufficient importance to have been brought prominently to the attention of those who attended this meeting.

## THE PRICE OF HEATING APPARATUS.

It is a matter of history that at the last meeting of the manufacturers of house heating boilers and radiators a compromise was made in the interest of general harmony, and the advance in the price of boilers and radiators decided upon was but one-half of what had been agreed upon in the early deliberations of the body. As has been previously noted, the steam fitters anticipated this advance, and there are not wanting among the more careful buyers of heating goods some who are not satisfied that the advance in the price of such goods will stop at the point reached about a month ago. This opinion is justified by the continuance of the conditions of cost, and should these goods be advanced to the point originally contemplated there will be little cause for surprise. There is a feeling, however, on the part of some manufacturers that an advance having been made, to make another advance at this time would have a demoralizing effect which would be detrimental to this branch of trade. Should this opinion gain sufficient strength it is improbable that higher prices will be made, notwithstanding that some expect such action and that many agree that the conditions prevailing would justify it.

## FIRST TOURNAMENT OF THE EASTERN TRADE GOLF ASSOCIATION.

One of the most enjoyable meetings of the representatives of the heating and plumbing supply trades was at the first tournament of the Eastern Trade Golf Association, held on Thursday afternoon. The members are especially indebted to Frank B. Barrett, a member of the Fox Hills Golf Club on Staten Island, through whose courtesy they enjoyed the use of the 18-hole links of the club, covering 6066 yards, and being one of the finest in the vicinity of New York, having natural hazards with no artificial bunkers and exceptionally large greens of 100 feet square. In playing over the course a continual change of fine scenery is presented by the hills, the long vistas and a grand view of New York harbor. Through the kindness of W. W. Lowrey, the chairman of the Green's Committee, the course was in fine condition, and every hospitality of the club was placed at the disposal of the players, while their com-

fort was further provided for by the fine dinner which he arranged to be served.

The players arrived early, although all through the morning and the early afternoon recruits from the trade put in their appearance. The West was represented by H. M. Cole, Charles K. Foster, George E. Downe and Chauncey L. Williams, secretary of the Western Trade Golf Association. Owing to the absence of President C. H. Simmons and Vice-President C. W. Woodward and the illness of Secretary H. A. Smith, the treasurer, Frank C. McLain, and Captain E. C. Molby managed the tournament so as to win the hearty congratulations of the members.

The morning was occupied with the qualifying round, for which pairs were soon arranged, and the scores made were as follows: Charles K. Foster, 88, which score made him the first winner of the fine bronze figure of a golf player, presented by W. A. Russell & Co. of Detroit for the best score for the first 18 holes, open to Eastern and Western contestants, and to be won three times consecutively to become the property of the winner; W. H. Thayer, 90; Frank H. Simmons, 91; Frank B. Barrett, 93; P. R. Jennings, 101; A. W. Maine, Jr., 101; W. L. Herendeen, 102; Chauncey L. Williams, 104; Frank C. McLain, 105; E. C. Molby, 105; H. S. Martin, 106; Howard Hovey, 109; George E. Downe, 109; W. C. Marsh, 114; E. F. Glore, 123; P. H. Seward, 124; H. W. Walton, 126; A. A. Ainsworth, 128; H. D. Carter, 156. On the completion of the morning's play the dinner was enjoyed, at which the spirit of *bon camaraderie* prevailed.

In the afternoon play was resumed, resulting in the Association Challenge Cup being won in the first flight by P. R. Jennings, with a score of 89, while W. H. Thayer, with a like score, won the Bruce & Cook Silver Cup for the runner up. Mr. Thayer also won the President's Cup, presented by C. H. Simmons for the best medal play for 36 holes, with a score of 179. Frank B. Barrett, with 94, and Frank H. Simmons, with 96, were also in this flight, and Mr. Simmons, with a score of 187, won the second prize for medal play, a fine cup presented by the *Engineering Review*. Mr. Barrett, with a like score, won the third prize for medal play, a fine cup presented by *Domestic Engineering*.

In the second flight, Frank C. McLain, with 101, won a fine silver cup presented by the Pierce, Butler & Pierce Mfg. Company, and A. W. Maine, Jr., with 106, won one of the pewter cups given by the association for the runner up. E. C. Molby, with 108, and W. L. Herendeen, with 110, were also in this flight. The *Plumbers' Trade Journal* gave a handsome silver cup for the third flight, which was won by Harry S. Martin, with 99, Howard Hovey, with 105, getting the runner up pewter mug. W. C. Marsh, with 114, and E. F. Glore, with 123, were also in this flight. The silver cup given by *The Metal Worker* for the fourth flight was won by Howard W. Walton, with 106, P. H. Seward, with 125, getting the pewter mug for the runner up. H. D. Carter, with 126, and A. A. Ainsworth, with 132, were also in this flight. Frank K. Chew of *The Metal Worker*, not qualifying, played with Frank S. Hanley in the afternoon, the respective scores being 157 and 164. H. M. Cole arrived in the afternoon after all the flights were off and went over the ground, making a score of 90.

The handsome pewter stein presented by the association for a driving contest was won by Captain Molby, with an average of 244 yards for three strokes. This contest closed the sport for the day, and after the expressions of thanks and congratulations to Captain Molby, Frank B. Barrett and W. W. Lowrey, every one voted the tournament not only a success, but a grand opportunity for establishing acquaintances of a character to extend confidence in the trade. After pleasant greetings between old friends and new acquaintances the farewells were spoken. The first tournament of the Eastern Trade Golf Association will be long remembered by many who witnessed the contests as well as those who participated in them as an affair that can be repeated with benefit to the trade and frequently. On the home journey Charlie Foster promised on behalf of the American Radiator Company a punch bowl set for a contest between teams of five or more from the Eastern

Trade Golf Association and the Western Trade Golf Association, to be played on neutral links, and Harry S. Martin offered the Willow Brook links at Dunkirk, N. Y. Should such a contest be arranged prizes for individual contests will be forthcoming.

### PLUMBING AND STEAM SUPPLY LEAGUE.

Notwithstanding that President Behrer, a month ago, sent out a circular letter to the supply houses in the vicinity of New York who were connected with the Plumbing and Steam Supply League in the bowling tournament, which brought so much pleasure to all concerned last winter, there have been fewer acknowledgments and entries to the league for the coming winter than there should have been. The vacation season is now ended and President Behrer and Captain Emery, aided by ex-President Haff and ex-Secretary Wilson, are now drumming up those who were interested in this tournament, and the treasurer, Fred. Lowe, 90 Beekman street, New York, is likely to be more busy receiving the necessary \$10 for an entrance fee, and the names of men from which the team will be selected to represent the supply houses with which they are connected. A feature of the league this year will be the entrance of two trade paper teams to contest for the prizes. *The Metal Worker* has entered one team and the *Plumbers' Trade Journal* the other team, and prizes to be competed for have been offered by both papers. The indications are that a larger number of teams will constitute the league this year, and an increased interest will be taken in the contest. Inasmuch as the officers intend limiting the number of teams which will constitute the league, those who are desirous of taking part in the contest should look to it that their entrance fee is paid at the earliest opportunity and full compliance with the rules observed.

### Manual for Steam and Hot Water Fitters.

The Magee Furnace Company, Boston, Mass., have favored us with a copy of the "Magee Manual for Steam and Hot Water Fitters." The manual consists of 72 pages, with several blank pages in the back part for memoranda. The first 37 pages are devoted to an enumeration of the merits of the Magee line of steam and hot water heaters, which are made both in the vertical sectional and round horizontal sectional forms. These heaters are made in an extensive variety of sizes, adapted for heating the largest buildings as well as for smaller work. The company's tank heaters are designed for furnishing hot water for apartment houses, as well as for heating conservatories, and include a line of laundry stoves adapted for heating water and also a large number of smoothing irons. Several pages are occupied by supplies, such as water gauges, water columns, damper regulators, expansion tanks, thermometers, &c. Thirty pages are devoted to useful tables and information for the assistance of the heating contractor in designing and installing steam and hot water heating plants, showing pictures of different radiator connections, connections with boilers and methods of taking branches from heating mains. The manual will be a valuable pocketbook for the practical steam fitter.

### A Car Heating System.

The Peoria & Pekin Union Railroad Company are installing a new coach heating plant to care for trains in the yards at Peoria, Ill., while not in use during the cold weather. This is necessitated by the fact that the plant now in use has been worn out by the constant train movement and the settling of the tracks over the principal supply pipe. When the yards were relaid some time ago the main gauntlet track was laid directly over the supply pipe of the heating track, and the constant vibration caused by the trains passing over this track, together with the settling of the earth has given rise to broken connections and other troubles without number until the company have determined to relay it entirely.

Twelve hundred and fifty feet of pipe will be laid to

secure the connections with the strings of coaches on the various tracks and the work will consume about two weeks' time. Of this amount about 900 feet will be 3-inch pipe and the remainder will be 1½-inch pipe. In addition to this the increased heating capacity required by the erection of the new freight house has made it necessary to purchase a new vacuum pump, with a capacity of 16,000 square feet radiation, and this will be installed at the same time, though it will not be necessary to increase the boiler capacity.

### The Second Wonder Acetylene Burner.

Those who have made a specialty of the sale and equipment of acetylene lighting plants recognize the desirability of a burner which perfectly consumes the gas and avoids any accumulation of carbon at the burner tip, involving frequent cleaning. In the accompanying illustration we show the Second Wonder burner patented by D. M. Steward and made by the State Line Mfg. Company, Chattanooga, Tenn. These burners are made for a single flame of ¼, ½, ¾ or 1 foot of gas per hour. They can also be furnished for a group of 2, 3, 4, 6 or 8 flames, each burning from ¼ to 1 foot, as de-

*The Second Wonder Acetylene Burner.*

sired. The Second Wonder burner consists of the usual brass cylinder for screwing on the fixture, and supports a lava tip, the distinctive feature of which is that the circular groove which constitutes the air inlet is cut from beneath in such a way that it is impossible for particles of dust and dirt to reach the gas jet and deflect the flame. This is said to prolong the life of the burner and to aid in the production of a flame of strong illuminating power and regular in size and shape. Samples of these burners for test are mailed by the manufacturers on receipt of 25 cents.

THE PHILIP CAREY MFG. COMPANY of Lockland, Ohio, are sending to the trade several pamphlets devoted to their line of manufactures. One is especially devoted to Magnesia and Asbestos Coverings, not only for steam and hot water heating mains, but for boiler covering, and for covering the pipes of hot air furnaces. The catalogue also shows a variety of Asbestos Rope and Wick Packing, Sheet Mill Board, Asbestos Sheathing, Hair Felt, Cement and especially constructed Packings for pistons and gaskets. Another catalogue is devoted to the use of their Pipe Coverings for ammonia and brine pipes of refrigerating plants. A little pamphlet, entitled "Practical Experience," consists of testimonials from individuals, firms and corporations using the Carey Pipe and Boiler Coverings.

## WRINKLES FOR THE PLUMBER AND STEAM FITTER.

BY K. S. R.

The man who is alert enough to profit by his spare moments can do many little things for his customers that will keep them coming to his shop in spite of the efforts of competitors to secure their trade. Study your customer, the whole family and their needs, suggest whatever would add to their comfort and name the price for it. Use your knowledge of your business for their comfort. It will brighten your wits and increase your value to yourself in the additional revenue that comes from the special work that you will get. The more you know how to do the more you can do in special lines that do not interfere with your regular trade. Brighten up and try making a profit out of your wits. As an incentive here are two profit winners that I have used that may be of interest to somebody:

### A RADIATOR WARMING CLOSET.

Warming closets for food and dishes are convenient and desirable for use in winter, and would undoubtedly be more generally used in connection with steam radiators if it were not for the considerable expense involved, and for the fact that the size of the radiator must be increased in order to preserve the requisite amount of heating surface to heat the room. This extra bulk of radiator, moreover, cannot be reduced during the summer months, when neither radiator nor warming closet is in use. An effective and slightly substitute, which may be removed when desired, may be provided at a comparatively slight expense. A stamped steel portable oven of proper size, such as is used on gas and oil stoves, is fitted with lugs and clips to make it set firmly on the radiator top. It may then be taken to the bicycle shop and enameled in any desired color and style to suit the finish of the room or pantry in which it is to be placed. Such a warming oven will repay many times the expense involved in the degree of comfort it affords.

### TO REPAIR A CAST IRON SINK.

It sometimes happens that the ordinary cast iron sink becomes broken or cracked while in use. Obviously, the best way to remedy such a condition of affairs is to replace the broken sink with a new one. The writer was called on to repair an old style odd sized sink which was split almost the entire width of the bottom. New wood work and copper work had been fitted to the sink only a few days before, and the owner objected strongly to the removal of the old sink. The following successful repair was quickly made:

As the iron of which the sink is composed had been under strain, one edge of the break stood higher than the other, and it was necessary to fasten them together. Two  $\frac{1}{4}$ -inch holes were carefully drilled and countersunk in the line of the break, and the parts were drawn together with 3-16-inch bolts and washers. A mixture of glycerin and litharge of the consistency of cream was then applied to the break on both sides, and the cast iron was carefully heated by means of a gasoline torch until the litharge had hardened. Another application of litharge and heat completed a repair which has stood the test of hot and cold water for more than a year and a half.

In the case of single holes all that is necessary is to ream and countersink the holes and insert a stove bolt with rubber and iron washer beneath, taking care that the rubber washer shall bind closely on the thread of the bolt. A steel sink may be soldered, or may be repaired by means of a copper rivet carefully flattened.

### A New Heating Force.

A most extraordinary discovery, says one of the dailies, is reported as having been made by Dr. Goldschmidt in Germany of a new heating force of almost incredible power. It results from a compound that was accidentally discovered in some experiments that Dr. Goldschmidt was making for the great Krupp gun works. The compound is simply aluminum filings mixed with oxide of chromium. If a lighted match be touched to it a heat of 5400 degrees F. is instantly cre-

ated, a heat, says a scientist, that the human mind cannot form a conception of. It would melt mountains into streams of liquid fire. And yet it may be controlled and regulated for use in factories, foundries and machine shops, for melting, welding and shaping masses of iron and steel. It is equally valuable for producing rare and costly metals in a state of almost absolute purity. And why might it not be put in capsules, one of which would heat a room in ten seconds?

## BOILER BELOW RANGE.

Through the courtesy of F. R. Porter, Southampton, N. Y., we are enabled to present herewith a sketch showing the piping used for connecting the water back in a range with a boiler on the floor below. The piping is very simple and can be readily understood, and interest in it will be increased when it is known that a system of this character has been installed by Mr. Porter and is working satisfactorily. It will be seen that the hot water pipe from the water back is connected with the hot water service pipe from the top of the boiler, which aids in securing a movement of the water when any of the hot water faucets on the system are used. It would

Boiler Below Range.

not be advisable to pipe on this plan where there are no fixtures above the range, unless the hot water pipe from the water back be carried up at least 10 or 12 feet above the range and connected with a short return bend and pipe carried down and connected with the boiler, as shown. If, however, there are fixtures on the second floor the method of piping illustrated will be found satisfactory. Mr. Porter states that it helped him on one occasion out of a very tight place and it may be of similar value to others under similar conditions.

## Valves, Injectors, Oil and Grease Cups, &c.

A large catalogue by the Lukenheimer Company of Cincinnati describes their most complete line of brass and iron steam specialties and engineering appliances. Since issuing their last catalogue in 1898 the company have greatly increased their facilities, and expect by the end of this year to occupy new factory buildings which will be unsurpassed by any similar structures of their kind. The Lukenheimer automatic injector is a simple, durable, efficient boiler feeder not liable to get out of order, and is fully guaranteed in every particular. It is stated that this injector will deliver more water per pound of steam than any other, which means a direct saving in fuel. The injector can be relied upon to start instantly after a temporary interruption of either the steam or water supply.

### A New Steam and Water Heater.

The increasing popularity of steam and hot water for heating small residences has created a demand among the steam fitters for boilers especially suited to this work. The form that has been found best suited to this demand is round and naturally of a simple construction, so that the all important question of cost would be satisfactorily answered. The J. H. McLain Company of Canton, Ohio, have recently brought out

A New Steam and Water Heater.—Fig. 1.—The Columbia Water Heater.

boilers to answer these requirements, and in Fig 1 we present a sectional view of the Columbia water heater, from which it will be seen that it presents a large surface directly exposed to the fire. The same boiler when equipped with more trimmings and made with a slightly higher dome for a steam chamber is designated by the company as the Lehigh steam heater, a broken view of which is shown in Fig. 2, the construction being the same in both heaters.

The products of combustion rise from the fire, as shown in Fig. 1, and pass through an opening at the front to a horizontal flue which encircles the heater at the top, and passing each way make a complete circuit of the heater before issuing through the smoke outlet at the rear. These heaters are made in four sizes, with

Fig. 2.—The Lehigh Steam Heater.

13, 16, 19 and 22 inch grates, and for hot water are rated to carry 225, 400, 550 and 650 square feet of direct hot water radiation. They can furnish 300, 520, 650 and 780 gallons of hot water per hour respectively when used for furnishing hot water for apartment houses in connection with hot water storage tanks. The same heaters are rated to carry 150, 250, 350 and 450 square feet of direct steam radiation. The height of the water line varies from 39 to 43½ inches in the largest size, adapting these heaters for low cellars, as the height to the top of the tapping boss in the steam heaters is 48 inches. The company have recently issued a catalogue giving full dimensions and particulars, not only of the Columbia and Lehigh boilers, but of the entire line of heating apparatus which they manufacture.

### Washington State Master Plumbers.

The Association of Master Plumbers of the State of Washington completed their annual meeting at Seattle on Thursday, August 28, by the election of the following officers:

*President*, W. J. Creevey, Seattle.

*Vice-President*, P. Joyce, Ritzville.

*Secretary*, D. H. Lyman, Seattle.

*Treasurer*, Ben Olson, Tacoma.

*Representatives to the National Convention*: W. B. Coffee, Tacoma; W. Westover, Everett; E. B. Lambert, Spokane; A. M. Goddard, Tacoma.

A considerable portion of the time of the convention was taken up in preliminary work toward the revision of the by-laws of the organization. At the close of the convention the delegates enjoyed an excursion to the Puget Sound Navy Yard at Bremerton, and a picnic at Evergreen Park. The banquet held at the Hotel Stevens Café on Thursday evening was one of the most enjoyable features of the convention, and its success reflected great credit upon the Banquet Committee, consisting of H. Lustad, J. E. Young, H. Coughlin, H. Steckles, Leo Turner and H. Rautman.

### A New Plumbing and Steam Supply Catalogue.

Catalogue No. 61, consisting of 514 pages, and bound in a red cloth cover, has just been issued by the Rumsey & Sikemeier Company, St. Louis, Mo. The first page presents a view of the company's new building, which contains 110,000 square feet of floor space. This is followed by brief notes for the assistance of those who order goods from the house. A well arranged index occupying ten pages precedes a telegraphic code covering goods handled by the concern. The first section is devoted to brass goods, including various styles of bibs, stops and supply and waste cocks, laundry tray bibs, sill and curb cocks and lavatory and bath cocks in a variety of styles and finishes of the compression and Fuller pattern, followed by shampoo cocks, basin wastes, chain stays, sprinklers and a variety of smaller goods used in the equipment of bathrooms. Brass ferrules, boiler couplings, solder nipples, union joints and hydrant nozzles precede a variety of cast iron hydrants and street washers, service boxes and valve boxes. The next 60 pages of the catalogue are occupied by copper linings, steel clad enameled iron bathtubs and foot baths and sitz baths, with bathtub seats, supply and waste fixtures, towel racks, soap cups, sponge racks, mirrors and shower baths. In another section are shown galvanized iron and copper range boilers, designed to be heated by water backs and provided with coils for heating with steam. Tank heaters and gas water heaters for connection with boilers, and also of the instantaneous type, are included in this portion of the catalogue. Laundry trays of enameled iron, stone and earthen ware are followed by painted and enameled cast iron and steel sinks for kitchens and pantries, slop sinks of various materials, cast iron cesspool traps, urinals and enameled iron lavatories; also handsome lavatories of marble and elaborately constructed supply and waste fixtures. Another part of the catalogue is devoted to nickel plated and brass traps, drawn lead drum traps, grease traps and a variety of patented traps. These are succeeded by urinals and urinal stall equipments in marble or slate, with all the brass and iron fittings required for their installment. Water closets of earthen ware and enameled iron of the plainest type to the most elaborate, with flush valves and low down closets, also range closets, occupy another section. Other lines of goods shown include soil pipe and fittings, plumbers' tools and a variety of ornamental drinking fountains and filters; also wrought iron pipe, pipe fittings and steam fitters' supplies, including steam traps, reducing valves, radiators and steam and hot water boilers, together with a variety of steam valves. These are followed by tools for steam fitters, including pipe cutting and threading machines and a variety of tools for all purposes. The catalogue closes with 50 pages devoted to gas lighting apparatus and fixtures, including the Eagle automatic acetylene generators and suitable burners for use with these goods.

### New York City Notes.

Brooklyn applicants have been in the majority for the past two months before the Examining Board of Plumbers, more appearing from that borough than from all the others combined.

\* \* \*

Robert Thain, formerly a well-known Columbus avenue master plumber, attempted suicide last Tuesday while temporarily insane.

\* \* \*

The price of oakum, oil, peppermint, &c., will remain the same, although the store of W. H. Crookson & Brother, who supply most of the plumbers with this line of goods, was destroyed by fire last Monday afternoon.

\* \* \*

Jasper & Goebel have the contract for plumbing the new Hegeman Drug Building at 202 to 204 Broadway.

\* \* \*

Young & Myers are practically doing a new job in the Sharkey Hotel at Lexington avenue and Twenty-fifth street.

\* \* \*

The Joint Conference Committee is now the hardest worked committee in Manhattan Branch, settling the differences arising between the masters and journeymen relative to wages, nonunion men, &c., arising under the new agreement.

\* \* \*

Among the new jobs under way are the following: Francis Callaghan, two tenements on Broome street, near Mulberry; Gus Jackson, an apartment house at 318-322 West Fifty-first street; S. Greenwald, a tenement at 336 and 338 East Fourth street; John J. Hickey, a loft building at 129th street and Park avenue; P. J. Kenny, a business building at Sixth avenue and Thirty-first street; M. L. Rohman, an apartment at 290-294 West Twelfth street; A. Susemihl, a factory at 227 to 229 East Forty-fourth street; John A. Smith, an apartment at Lenox avenue and 115th street; W. J. McDermott, the Jewish Theological Seminary on East 123d street; Wm. Bryan, an apartment on Ninety-fourth street near Riverside Drive, and T. A. Hill, an apartment at 161 to 163 Madison avenue.

### Heating and Plumbing Notes.

S. A. PHILLIPS of Amherst, Mass., has been awarded the contract for plumbing the Childs Hotel at Wilmington, Vt.

THE officials of the city of Cleveland, Ohio, and the County Government are considering the advisability of the joint ownership and operation of a central plant for heating the city and county buildings.

B. MACKENSIE, Greensboro, N. C., has the contract for heating the new Elwood Hotel with 60 steam Radiators and also the Commercial National Bank at High Point.

L. A. MCGUIGAN, Davis, W. Va., bid \$2240 and secured the plumbing and steam heating contract for the Cottrill Opera House at Thomas, W. Va. A Model Boiler will be used.

J. A. BAILEY of Kaukauna, Wis., has been awarded the contract for a modern heating and ventilating system in the High School at Kiel, Wis., at his bid of \$2900.

THE BUCKINGHAM-ROTH COMPANY of New Haven, Conn., have been awarded the contract for the plumbing in the fine new residence which is being erected in that city for Miss Cora B. Wetmore.

W. P. KIRK, Bridgeport, Conn., is installing the plumbing and heating systems in the new parish house of St. John's Church in that city.

WILLIAMS & MARVIN, Deep River, Conn., make a specialty of the manufacture of Closet Pulls of all kinds. They issue an illustrated catalogue of 14 pages, referring to some of the varieties of these goods which they are manufacturing in various styles and finishes. Special attention is called to their patented Closet Pull, in which the ring is kept in place by a screw connected with a rod which runs through the center of the Pull, the latter

being provided with a rubber fender so inserted in the body of the Pull that it cannot possibly come off. These Pulls are made in two sections. The firm are also manufacturers of Plumbers' Chains and Eight Hooks made in hard brass by automatic machinery, and which are, therefore, absolutely uniform.

THE contract for steam fitting the new G. A. R. Hall at Middleboro, Mass., has been awarded to M. W. Baxter of that place.

THE UNION ENGINEERING COMPANY, 95 to 97 Liberty street, New York, are installing a 2750 foot Henderson Thermo Steam Boiler in the School Building of the Children's Aid Society, East Broadway, New York.

E. BRADLEY LORING has just installed a new heating apparatus in the Savings Bank Building at Hingham, Mass., a Kelsey Generator being used for the purpose.

CARTER, EVANS & Co., Bangor, Maine, have secured the contract for plumbing three new apartment houses for Dr. Atwell Sweet in that city.

THOMPSON BROTHERS of Philadelphia, Pa., have contracts in hand for the installation of a low pressure steam heating apparatus, to cost \$750, at 1837 South street, and one to cost \$956 at Alder and South streets; also a similar system in the Gyncecan Hospital, Philadelphia, to cost \$960.

EIGHT plumbing firms of Toledo, Ohio, have joined in a petition to the Mayor, protesting against the signing of an ordinance making a change in the method of opening paved streets for water and sewer tapping.

THE BUCKEYE STEAM FITTING COMPANY of Cleveland, Ohio, have the contract for installing a hot water heating system in the new residence of Z. D. Patterson in that city.

D. M. & A. D. BURNS of Green Bay, Wis., have been granted a patent on a new Heating Boiler, which is said to utilize the maximum of heat in the coal.

A CONTRACT for the steam heating of two fire companies' houses at West Hoboken, N. J., have been awarded by the Town Council to E. C. Thourot & Co., at their bid of \$799.

THE SCHLUCKEBIER HARDWARE COMPANY, Petaluma, Cal., have been awarded the contract for plumbing the elegant mansion which is being erected at that place for D. J. Healey.

L. E. ANDREWS & Co. of Gloucester, Mass., will furnish the heating apparatus for the new M. A. Pickett Association Building at Marblehead, Mass.

JAMES T. McNAB, 95 Prospect street, Paterson, N. J., will install Henderson Thermo Steam Boilers in the new buildings of the Lauter Piano Company, the Postal Telegraph Company, and Samuel Sykes, druggist.

WILLIAM P. FERGUSON of Knoxville, Tenn., has been appointed a plumber for the United States Army and assigned to service with the Sixteenth Infantry at Fort McPherson, near Atlanta, Ga. Mr. Ferguson served with the Tennessee Volunteers in the Spanish-American War and spent some years in Cuba and the Philippines.

THE contract for heating the new Norman County Court House at Ada, Minn., has been let to the Pond & Hazy Company of Minneapolis.

E. J. ERBELDING was awarded the contract for the installation of a new steam heating system in the City Hospital of Augusta, Ga., at his bid of \$1653.

J. HOWARD EWALD, 83 Laclede Building, St. Louis, Mo., has been appointed sole agent for Southern Illinois, Missouri and Texas for the Scaife and We-Fu-Go water softening and purifying systems manufactured by Wm. B. Scaife & Sons Company, Pittsburgh, Pa. Mr. Ewald has been for years identified with the iron and steel industries in this section. He has made a special study of the subject of water purification.

THE REMPE COMPANY, Chicago, in a substantially bound catalogue call the attention of the trade who used Wrought Iron Pipe and Iron Pipe Coils to the fact that the Wrought Pipe they manufacture is made from refined skelp especially designed for bending, and when bent by special machines preserves the full circle of the Pipe. All welding is done by the electrical process. The catalogue not only illustrates the various purposes for

which Wrought Iron Pipe is designed, but presents fittings of an improved design and some of the most modern tools now in service in handling Wrought Pipe.

THE BIGNALL & KEELER MFG. COMPANY of Edwardsville, Ill., have issued a catalogue describing their line of Pipe Threading and Cut Off Machines. Their Peerless No. 3 Improved is especially designed for severe and exact service in the cutting of pipe from  $\frac{1}{4}$  to 3 inches and bolts from  $\frac{1}{2}$  to 2 inches. The bed is long, giving the carriage a travel of 27 inches, and the chucks and die head are of ample proportion. Their No. 18 machine is intended to thread and cut off standard merchant pipe from 8 to 18 inches. Eight sets of dies are included in the regular equipment, a separate set being furnished for each size of pipe, each set consisting of 12 chasers.

G. E. MONTAGUE of Springfield, Mass., will erect a plant for the building of Windmills for all purposes. A gasoline engine will be installed.

J. B. CARROLL, 36 La Salle street, Chicago, Ill., is issuing a four-page circular devoted to the Hahn Acetylene Burner. This Burner is said to give especially excellent service, owing to its construction, a feature of which is the relative size of the air inlets and the small gas orifice, so constructed as to insure perfect combustion of the gas and the complete absence of any carbon formation on the burner tip.

THE commissioners for the erection of a new City Hall at Newark, N. J., will receive bids until September 24 for a heating and ventilating system for the new building.

THE Board of Health of Wallingford, Conn., have informed Plumbing Inspector C. J. Leroux that he has the authority to enforce the compliance by factories with the rules of the Board of Health, and he has been instructed to see that they are lived up to.

THOMAS RYAN, acting secretary of the Department of the Interior, at Washington, D. C., will receive bids until October 1 for a central heating plant for the Government Hospital for the Insane at Washington, D. C.

THE Board of Works of Newark, N. J., has decided to erect Sanitary Closets in Washington, Military and Lincoln parks. The structures will be of iron and located near the center of each park, a short distance from the principal pathway. They will be surrounded by shrubbery, so that they will be entirely hidden.

GRAY & SUTER of Sedalia, Mo., bid \$1600 and secured the contract for installing a steam heating apparatus in the Howard Payne Building in that city.

THE Board of Health of Lorain, Ohio, have denied the petition of the plumbers of that city to charge a \$25 license fee, the object being to prevent the Lorain plumbers from having to compete with plumbers from out of town.

THE Master Plumbers' Association of Taunton, Mass., has denied the request of the journeymen plumbers for an eight-hour day, owing to the fact that none of the other trades in the city have an eight-hour day.

A MOVEMENT is on foot in Birmingham, Ala., to have a revision of the local building and plumbing laws so as to bring them more into conformity with the rapid growth of the city.

THE B. F. SHAW COMPANY of Wilmington, Del., have received the contract for a heating plant for a large building for the Pennsylvania Steel Company, at Steelton, Pa.

THE SUNLIGHT LAVA MFG. COMPANY, Chattanooga, Tenn., are issuing a very neat pamphlet of 12 pages devoted to the variety of Acetylene Burners which they manufacture and recommend. These Burners vary in lighting capacity from  $\frac{1}{4}$  to 1 foot per hour, though a larger Burner and Group Lights can be furnished if desired.

J. A. PAINCHAUD, Montreal, Canada, is sending to those interested in lighting by acetylene a six-page folder devoted to his Gasoline Apparatus, which is said to be "fool proof, fire proof and reliable in operation." The circular enumerates the various considerations that should receive attention by the purchasers of such apparatus.

A NEW sanatorium at Attleboro, Mass., invites bids for the heating and plumbing.

McGLYNN & Co. bid \$1487 and secured the contract for a steam heating plant for the new Quigley bakery at Taunton, Mass.

FRANK G. DU BOIS, who is well known to the Plumbing Supply trade, is sending to his friends blotters calling attention to his removal, and giving the location of his new office at 150 Nassau street, New York, with telephone No. "2558, John," where he can be either found or called up to audit accounts or do expert accounting work. Mr. Du Bois has had 30 years' experience in general business, manufacturing, trade, &c., and is well qualified to render assistance to those who need help in their accounting department.

THE Ansonia apartment building in New York City, according to a recent description by A. L. Rice in the *Engineer*, will have its own power plant for furnishing 18,000 lights, supplying steam to 2500 radiators, hot and cold water to 1000 faucets through 160,785 feet of Pipe, cold brine to 400 Refrigerators and ice water to each of the 340 suites of apartments.

THE new Tube mill of the Wheeling Steel & Iron Company, at Benwood, W. Va., has been started up. This plant is equipped to make Tubes up to 8 inches in diameter. The skelp for the Tube mill will be rolled by the company in their own skelp mills.

THE Asbestos Mfg. & Supply Company, St. Louis, have rented a factory to be added to their works. The company make Steam Pipe and Boiler Coverings.

THE output of Pipe at the National Works of the National Tube Company, at McKeesport, Pa., in August was the largest in any one month in the history of that plant and amounted to over 1000 tons a day for 26 days.

C. L. BASTIAN MFG. COMPANY, 76-82 Illinois street, Chicago, Ill., have issued their Catalogue B of Siamese Hose Valves, Hydrant Gates, Automatic Couplings, Hose Pipes, Nozzles, &c. The company are also brass founders and finishers, and make a specialty of Castings of every description in aluminum, German silver, phosphor bronze, red and yellow brass.

THE TRENTON POTTERIES COMPANY of Trenton, N. J., have just issued a reproduction of the illustrations of their Ideal Solid Porcelain Ware which will be shown in their D catalogue and which will be issued in the immediate future and which will contain, so far as practical, illustrations of a complete line of Sanitary Goods of all descriptions made by the Trenton Potteries Company. They have largely increased their facilities for manufacturing Solid Porcelain Goods and now have two plants making this line of goods exclusively. With the fact that their Ideal brand of goods is known throughout the trade, and with the increased facilities they have for handling all orders intrusted to them, it is expected that their business in this line will be materially increased very soon.

THE eighth and September edition of the Directory of Recognized Master Plumbers, issued by President E. D. Hornbrook from the headquarters of the National Association of Master Plumbers in Kansas City, Mo., contains 200 pages, an increase of 14 pages over the last issue. It shows the prosperity of the national body under the present president, who is to be congratulated.

QUARTERMASTER H. J. SLOCUM, Chattanooga, Tenn., will receive bids until October 8 for heating, plumbing and gas piping for 65 frame building, constituting the new military post at Chickamauga Park.

J. H. MOSELAZE bid \$4373 and secured the contract for tiling and plumbing the Cordova Hotel at Memphis, Tenn.

GEORGE J. TOBIN of Plainfield, N. J., has secured the contract for plumbing in the new wing to be built on the State Capitol at Trenton. The contract price for this work is \$15,000. Mr. Tobin also secured the plumbing work at the State Reformatory at Rahway.

SPRIGGS BROS., Grand Forks, N. D., have received the second carload of House Heating Boilers required for contracts they have for customers in different towns in the State. They report business with them as very good.

**New Firms and Changes.**

J. C. ESLOW has opened a plumbing and heating business at Albion, Mich.

THE LOCKE REGULATOR COMPANY, Kittery, Maine, have been incorporated with a capital of \$250,000 for the purpose of making and selling Steam and Water Pressure Regulators. The officers are: President, Charles C. Smith; treasurer, Brainerd E. Smith of Kittery, Maine.

H. P. BLACKWOOD has opened a plumbing shop at Ogden avenue and Fifth street, West Superior, Wis.

THE RICHMOND PLUMBING COMPANY of Richmond, Va., whose incorporation was reported in our last issue, have begun business at 26 North Ninth street, Richmond. The officers are as follows: President, J. G. Davidson; vice-president, W. T. Yarbrough; secretary and treasurer, H. T. Burley. These, with T. K. Sands and J. Temple, constitute the Board of Directors. H. M. Delaney, one of the best known and most experienced plumbers of the city, will have charge of the company's plumbing branch. The concern are prepared to bid on all plumbing and tinning, gas fitting, sheet metal, electric wiring and other work of like nature. The paid in capital stock of the company is \$10,000. They are in possession of a handsome store and showroom, where they make a fine display of Mantels, Chandeliers, Gas Stoves, Ranges, Bathroom Fittings and other goods.

**New Publication.**

**The National Tube Company's Book of Standards and Useful Information.**—Pocket form. Gilt edge. Leather bound with flap. Pages, 322. Price, \$1.

This volume, which has just been issued by the National Tube Company, Pittsburgh, Pa., is a valuable contribution to engineering literature. It is not simply a catalogue of the products manufactured by the National Tube Company, although considerable space is given to this subject. It contains a great deal of related engineering matter which has been specially edited for this book by Prof. Reid T. Stewart. The object aimed at by this book has been to group together all the dimensions and data pertaining to standards as manufactured by the National Tube Company, for the purpose of making the publication a practical and valuable aid to all users of pipes, tubes, &c. The use of tubular goods has become so extensive that a great variety of articles necessary for different purposes has to be manufactured and a large amount of data has accumulated on the subject.

The book is divided into ten departments. These departments are indicated by the following sub-titles, each occupying a full page: Tables of Standard Dimensions of Tubular Goods as Manufactured by the National Tube Company, Dimensions of National Trolley Poles and Deflections Under Stated Loads, Seamless Tubular Goods, Useful Information Relating Chiefly to Tubular Construction, Steam and Steam Apparatus, Air, Gas, Iron and Steel, Weights and Measures, Mensuration, Trigonometry and Mathematical Tables. At the end of nearly every department a view is given of some one of the company's works, which are located at McKeesport, Pittsburgh, Middletown, Philadelphia, Chester, Oil City, Ellwood City, Christy Park and Versailles, in Pennsylvania, Wheeling in West Virginia, Youngstown and Warren in Ohio, Syracuse and Cohoes in New York and New Castle in Delaware.

The tables of standard dimensions are very comprehensive, giving the sizes, thickness, circumference, transverse areas, weight per foot, threads per inch, heating surface, standard dimensions of couplings, weight of fittings, possible upsets for tubes and all other information which is desired in connection with these products. The dimensions of National trolley poles and deflections under stated loads are given in a series of tables which are conveniently arranged for ready reference. The details relative to seamless tubular goods comprise tables showing the weight per foot in pounds of various diameters, together with illustrations of hydraulic forgings, such as carbonic acid gas cylinders, boiler shells, projectiles, &c. The information relating to tubular construction covers a series of articles relative to boiler incrustation and corrosion, water pressure, flow of water in pipes, frictional heads at given rates of discharge, discharging capacities of full smooth pipes, the contents of

pipes and cylinders of various diameters, weight of water in foot lengths of pipe and data relative to water power, pumps and pumping engines, &c. The department relative to steam and steam apparatus gives tables showing properties of saturated steam and factors of its evaporation, formulæ covering the flow of steam in pipes, resistance to flow by bends, valves, &c.; chapters on nonconducting coverings for steam pipes, power of engines and boilers, sizes of chimneys for steam boilers, &c.

The department on air gives tables for adiabatic compression or expansion of air, volumes of mean pressures per stroke, temperature, &c., in the operation of air compression and a great deal of useful information on volume and pressure curves of air, efficiency of air compressors at different altitudes, flow of air through pipes, &c. The department devoted to gas gives a formula for the flow of gas through pipes, tables covering the maximum supply of gas through pipes, services for burners, weights of gas holders, &c.

The department relating to iron and steel covers a short treatise on the method of manufacturing iron and steel and gives standard specifications for special open hearth plate and rivet steel, tables of strength of materials, a chapter on mechanics of materials relating to tubular construction, formulæ covering deflection and strength of pipes to resist bending action, chapters on stress due to internal bursting pressure, strength of thin cylinders to resist bursting, strength of cylinder ends or heads, and a large number of tables giving breaking loads in tons of hollow, cylindrical and wrought iron pillars, shearing and bearing value of rivets in pounds per 100, weight of bolts, sizes and weights of sheets and plates of various metals, United States or Sellers system of screw threads, strength of wrought iron pillars, &c.

The department treating of weights and measures covers the ordinary tables of weights and measures, as well as the metric system and mechanical, electrical and heat equivalents. The department covering mensuration, trigonometry and mathematical tables is quite comprehensive, filling 45 pages. A very complete index is found at the back of the book, requiring 15 pages.

**Alcohol Motors in Germany.**

The alcohol or "spirit" motor industry has been developing very rapidly in Germany. The chief advantages of these motors as compared with steam engines are that they are always ready for work without a preliminary warming up; they can be filled up, oiled and started in from two to three minutes, there is no constant supplying of coal and water, no danger of fire or explosion, no consents required from Government authorities and no compulsory inspection. Their working is independent of the state of the weather, the "spirit" is easily obtainable in all districts, there is no smoke or smell, and the weight of portable "spirit" motors is about half the weight of portable steam engines of equal power. The "spirit" for motors, containing 90 per cent. of pure alcohol, can be purchased at from 20 pfennige to 22 pfennige per liter (about 3 cents per pint), delivered at any station in Germany. The motors exhibited at an agricultural fair at Halle last year were from 1 to 25 horse-power. As regards cost, the Dürr Motor Company were exhibiting portable spirit motors of 6 to 8 horse-power at \$1000, 10 to 12 horse-power motors at \$1300 and 16 to 20 horse-power at \$1625. Of the tests made one trial gave a consumption of 0.92 pound of 86 per cent. spirit and 0.81 pound of a mixture of one-fifth benzol and four-fifths 86 per cent. spirit, in both cases per B. H. P. per hour.

It is reported that the output at the Bellaire Steel Works, Bellaire, Ohio, last week was the largest in the history of the mill. In one turn of 12 hours the men made 54 heats of 540 tons of steel. This is the record for a single turn and makes over 1000 tons in the full turn. This work was done with machinery that a year ago was claimed could not make more than 500 tons in two turns. The prediction that the mill could make 1000 tons of steel in 24 hours was derided.

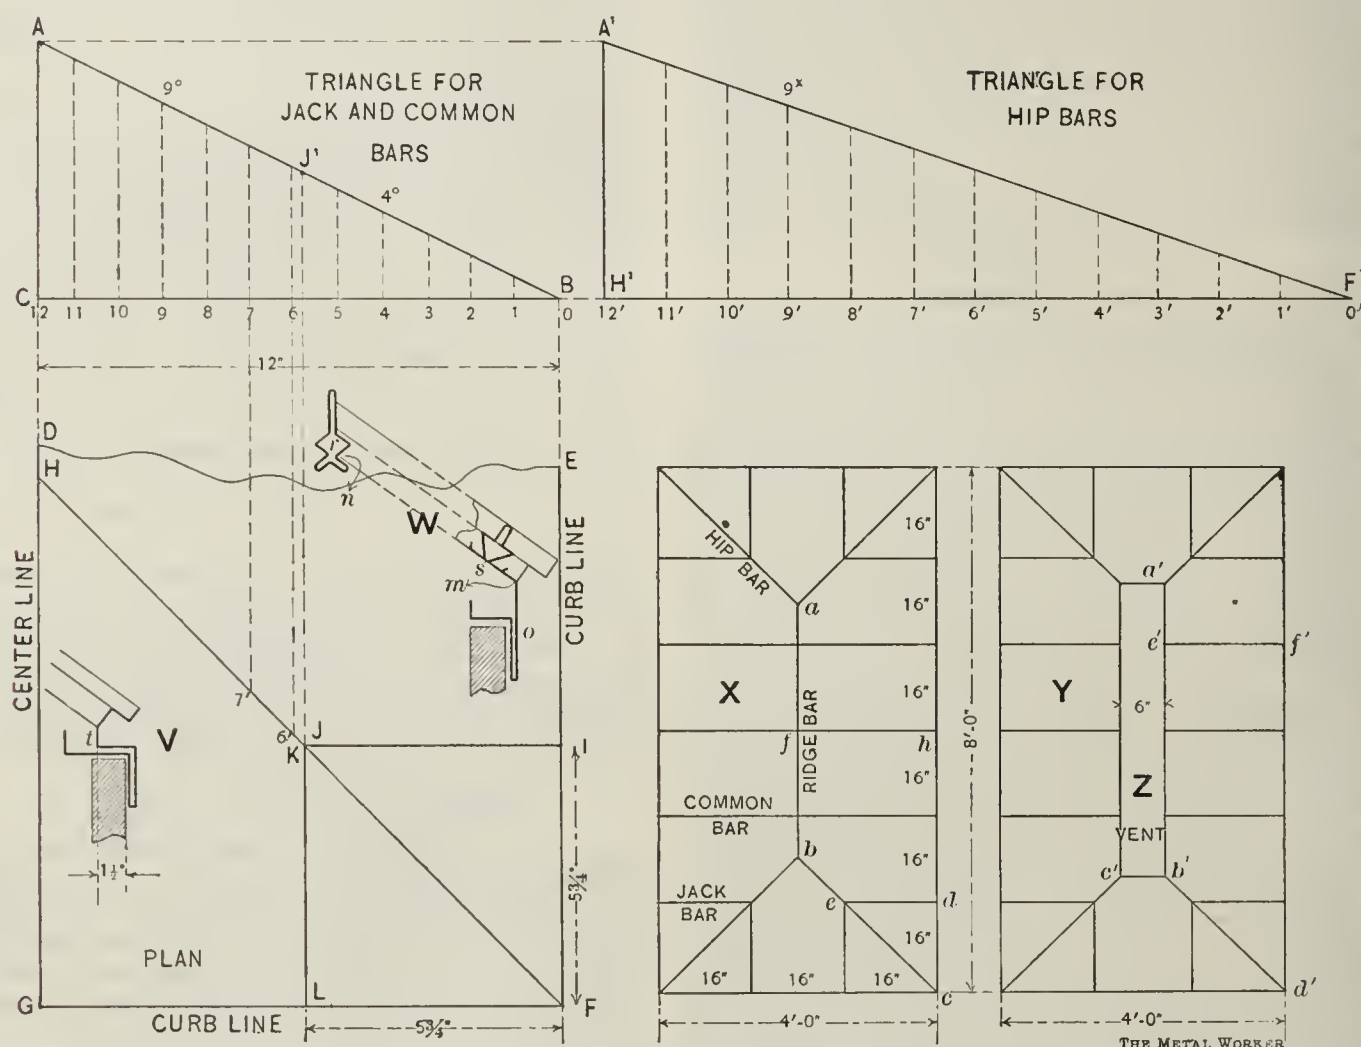

## FINDING THE LENGTHS OF SKYLIGHT BARS.

A New York City correspondent asks *The Metal Worker* to describe the best method for laying out skylight bars. In reply to this question it may be said that there are various methods in use for obtaining the lengths of the hip, jack, common and ridge bars in hipped skylight work. One of the simplest and quickest methods is here shown. By using this method any length of bar can be obtained from a drawing about 12 x 18 inches in size. It is only necessary to bear in mind that the size of the curb, or frame, forms the basis for all measurements, and that one of the lines or bends of the bar should meet the line of the curb, as shown in diagram W of the accompanying illustration, where the bottom of the bar meets the curb *o* at *m*, and the ridge bar *r* at *n*. Therefore, when laying out the lengths of

hip bar. Now take the distance *H F* and set it on the horizontal line *H' F'*, which also divide into 12 equal parts, as shown from 0' to 12'. At right angles to *H' F'* draw *H' A'*, equal in height to *C A*, as shown, and draw the hypotenuse *A' F'*. From the various points 0' to 12' erect lines at right angles to *H' F'*, intersecting *A' F'*, as shown. In practice each of the spaces on *H' F'* should also be divided into eight equal parts representing  $\frac{1}{8}$  inch.

In the plan, *I J* and *J L* represent the center lines of two jack bars spaced  $5\frac{1}{4}$  inches from *F* on the curb line. A perpendicular line carried up from the point *J* until it intersects the hypotenuse at *J'* would give the length of the jack bar, as shown from *J'* to *B*.

Now, to explain how these triangles are used in practice, the diagrams *X* and *Y*, showing respectively a skylight without and with a ventilator whose curb measures

Finding the Length of Skylight Bars.

the bars, they would have to be measured on the line *s*, from *m* to *n*.

First draw any line, as *B C*, 12 inches in length. From *C*, at right angles to *B C*, erect the line *C A*, in length so that a line drawn from *A* to *B* will be the pitch equal to that used in obtaining the pattern. Or, if a new set of patterns is desired, make *A B* one-third pitch. Then will *A B C* represent a half section through a skylight, say, 2 feet wide, and *A B* will be the length of the common bar. Now divide the distance *B C* into 12 equal parts, which represent inches, and from these intersections, at right angles to *B C*, erect lines intersecting the hypotenuse *A B*, as shown. In practice the 1-inch spaces are divided into eight spaces, the same as on a 2-foot rule. Then will *A B C* represent a triangle for obtaining the true lengths of jack and common bars for any size of skylight.

It will now be necessary to construct a triangle from which the length of the hip bar is obtained, and for which proceed as follows: Directly below *B C* draw part of a half plan view, as shown by *D E F G*, and from *F* draw the diagonal line at an angle of 45 degrees, as shown by *F H*, meeting the center line at *H*. Then will *H F* represent the plan of the center line of the

4 x 8 feet, has been prepared. Three rules are used in connection with these triangles, the comprehension of which will make clear all that will follow.

**RULE 1.** To obtain the length of the ridge bar in a skylight without a ventilator deduct the short side of the curb from the long side.

*Example:* In diagram *X* take,  
8 feet (long side of curb) — 4 feet (short side of curb)  
= 4 feet (length of ridge bar, *a b*).

**RULE 2.** To find the length of the ventilator in a skylight deduct the short side of the curb from the long side and add the width of the desired ventilator.

*Example:* In diagram *Y* take  
8 feet (long side of ventilator) — 4 feet (short side of ventilator) = 4 feet.  
4 feet + 6 inches (width of ventilator) = 4 feet 6 inches (length of ventilator, *a' b'*).

**RULE 3.** To find the lengths of either common or hip bars deduct the width of the ventilator, if any, from the length of the shortest side of the frame or curb and divide the remainder by two. Apply the length thus obtained on its respective triangle for common or hip bars and determine the true lengths of the desired bars.

*Example:* As no ventilator is shown in diagram *X*

there will be nothing to deduct for it, and the operation is as follows:

4 feet (shortest side of frame or curb)  $\div 2 = 2$  feet.

We now have the length with which to proceed to the triangle for common and hip bars. Thus the length of the common bar  $f h$  will be equal to twice the amount of  $A B$ , while the length of the hip bar  $b c$  will be equal to twice the amount of  $A^1 F^1$ . Referring to diagram X, the jack bars  $e d$  are spaced 16 inches, therefore the length of the jack bar for 12 inches will be equal to  $A B$ , and for 4 inches equal to  $4^{\circ} B$ , both of which are added together for the full length. The length of the jack bars in diagram Y will be similar, but the common and hip bars are shorter because a ventilator is used. Now, following Rule 3,

48 inches (length of short side) — 6 inches (width of ventilator) = 42 inches.

42 inches  $\div 2$  inches = 21 inches = 1 foot 9 inches.

Then, in skylight Y, the length of the common bar  $e' f'$  will be equal to  $A B$  and  $9^{\circ} B$  added together and the length of the hip bar  $b' d'$  equal to  $A^1 F^1$  and  $9^{\circ} F^1$ . Use the same method where fractional parts of an inch occur. If the curb is bent, as shown in diagram V, bringing the bottom line of the bar  $t$   $1\frac{1}{2}$  inches toward the inside of the frame all around, then instead of using the size of  $4 \times 8$  feet as the basis of measurement deduct 3 inches on each side, making the basis of measurement 3 feet 9 inches by 7 feet 9 inches, and proceed as explained above, which will make all the bars a little shorter.

### The Position of the United States Steel Corporation.

The American Iron and Steel Association have compiled from the returns at their disposal a full statement of the production of the United States Steel Corporation in 1901, as compared with the total production of the country, with a view of combating the statement frequently made that the steel corporation monopolized the production of the iron ore, pig iron and finished iron and steel in this country. With the exception of iron ore, the statistics presented have been carefully compiled from the returns of production made to the American Iron and Steel Association by the constituent companies of the United States Steel Corporation and by all other iron and steel manufacturing companies. The iron ore statistics in 1901 were obtained from the corporation itself and from other authentic data collected by the association, and all the figures given are said to be complete and absolutely correct, nothing having been estimated. The statement shows that of the total production of iron ore in 1901, 28,887,479 tons, the United States Steel Corporation produced 12,692,213 tons and the independent companies 16,195,266 tons, giving the steel corporation 43.9 per cent. of the total output. Of the total amount of pig iron produced in 1901, 15,878,354 tons, 6,803,988 tons were made by the steel corporation, against 9,074,366 tons by independent companies, a percentage for the steel corporation of 42.9. In a total of 13,369,611 tons of Bessemer and open hearth steel, 8,860,584 tons were produced by the steel corporation, against 4,509,027 tons by the other companies, a percentage of 66.3 for the steel corporation. All other finished iron and steel products, including steel rails, structural shapes, plates and sheets, wire rods, bars, skelp, cut nails, &c., the United States Steel Corporation produced 6,189,958 tons, against 6,159,369 tons produced by the other companies, or 50.1 per cent.; while of wire nails 6,446,938 kegs of 100 pounds each are credited to the United States Steel Corporation, against 3,356,884 kegs for the independent companies, a percentage of 65.8 for the steel corporation.

THE Bar mill at the plant of the Muskingum Valley Sheet Steel Company, Zanesville, Ohio, has been shut down. The closing of the mill is said to be due to the fact that the company can obtain all the Bars needed for their Sheet mill from other mills at a cheaper price than they could manufacture them. The company are reported to have a number of orders ahead, and their plant is in steady operation.

### Welsh Tin Plate Makers and Metal Ceilings.

The prospects of the Welsh tin plate trade are the subject of much discussion on the other side. Says the London *Ironmonger*: "Though the adverse vote of the Welsh tin plate workmen in the United States has for the moment frustrated the attempt of the American Tin Plate Company to capture the rebate trade, Welsh manufacturers cannot shut their eyes to the fact that the time will come when America will supply the whole of the tin plates required by its consumers. It, therefore, behooves the Welsh manufacturers to look to other sources of consumption." To this end the *Ironmonger* suggests that they take into serious consideration the desirability of putting on the market "steel embossed sheets for ceilings and wainscoting," which can be produced more cheaply than tin plates. In other words, the Welsh tin plate makers are urged to embark in the production of steel ceilings and sidewalls. South Africa, it is suggested, will presently require a large amount of material of this kind in the houses being erected or to be built in the future there.

American metal ceiling manufacturers should take this hint. Steel ceilings and side walls are especially adapted to the needs of South Africa, and it should be possible to open up a big market for this class of goods in that country. A suggestion has also been thrown out that the Welsh Tin Plate and Sheet Makers' Association should erect a model dwelling in Swansea to show the advantage of steel embossed sheets for interior decoration and also of terne plates for roofing. This is another hint that might be worth the attention of American manufacturers. Why should not such an object lesson of American productions in the line indicated be feasible and profitable in South Africa or other promising markets? In no better way could the merits and advantages of metal ceilings and side walls be brought to the attention of foreign consumers.

### The German Sheet Syndicate.

There are some features connected with the German sheet syndicate which are interesting. The 45 members have a minimum participation of 368,000 metric tons based on sheets of 1 mm. (0.039 inch) thickness. Heavier sheets are figured at a lower rate, while lighter sheets are counted at a larger rate. Thus a product of 100 pounds of 1.15 mm. sheets (0.059 inch) are counted as 80 pounds, while 100 pounds of 0.5 mm. (0.0197 inch) sheets are counted as 180 pounds and 100 pounds of 0.375 mm. (0.0148 inch) sheets at 260 pounds. The basis is a capacity of 4 metric tons per 12-hour shift. The different districts participate in the following proportion: Rhenish Westphalia, 185,000 tons; Sieg and Lenne, 115,000 tons; South German, 42,000 tons, and Upper Silesia, 26,000 tons. The largest individual mills are Dillinger Huettenwerke, 32,000 tons; Wolf, Netter & Jacobi, 25,000 tons; Stahlwerk Hoesch, 22,000 tons, and Grillo, Funke & Co., 21,000 tons. The outside mills, some of which co-operate with the syndicate, represent a tonnage of about 40,000 tons. The sales and the distribution of specifications are managed by the firm Verband Deutscher Feinbleck-Walzwerke, at Cologne.

### PRESIDENT SHAFFER'S POSITION.

It would appear that serious differences exist at the present time between President Theodore J. Shaffer and the rank and file of the Amalgamated Association of Iron, Steel and Tin Plate Workers. It is well known that Mr. Shaffer has been a persistent advocate of the acceptance of the offer for a reduction of wages on work on tin plates for the export trade made by the American Tin Plate Company. Mr. Shaffer has used all his influence to persuade the tin workers to accept this offer, but the result has not been according to his advice. He is now in the position of a leader of a revolted following, a majority of the members of the Amalgamated Association having voted against the proposition which he supported. It is said that Mr. Shaffer's action in the present instance is practically sure to prevent his reelection as president of the Amalgamated Association.

According to a recent newspaper interview President Shaffer is credited with the statement that he would force the tin plate workers to accept the American Tin Plate Company's proposition. Whether he has the power to do this remains to be seen. But, meanwhile, there is no question that a very sharp difference of opinion exists in the association, which may possibly lead to a split in the future.

### SOME LESSONS ON LEAKS.

BY OLD ROSINHEAD.

Leaks are of various characters and of a greater or less degree. Webster's definition of a leak is "a hole or crack that permits a fluid to pass." This is not definite enough for all practical purposes, for we know that elements other than fluids leak. The greatest leak that we have to contend with is the leak in our pocketbook. We have the hardest time imaginable trying to compress something into it, but before the week is half gone it has entirely leaked out.

The most singular leak we ever had to deal with occurred several years ago. One Saturday night we bought a bottle of vegetable water, highly colored (not mineral), and placed the flask in our inside coat pocket. As it happened, we got the bottle upside down, and, lo and behold! when we wished to take an eye opener next morning all we found was an empty bottle and a dry cork. We might have borrowed a clothes wringer, but we did not know of any one in the neighborhood who was possessed of such an article. So we went and stood the merchant off for a drink—of vegetable fluid. The leak in the pocket at this time was the more marked of the two.

We heard a story of a wonderful leak narrated as having occurred during the Civil War. The Commissary Department at a fortified post town received four barrels of whisky. As there was no room to store it in the freight house on its arrival the barrels were up-ended on the depot platform and a guard placed over them for the night. Next morning two or three of the barrels were empty. During the night the soldiers had bored a hole up through the platform and into the barrels, carrying the contents off to camp in kettles, pots, &c.

Ten or 12 years ago we had occasion to put in four or five days' work repairing leaks on a large wholesale liquor house, and we personally know that several large leaks occurred in several well filled whisky barrels on the top floor. Every cask on that floor had the bung out, and bottles turned neck down into the holes. But these were naturally very different leaks from those previously mentioned. The first were gravity leaks and the last were from capillary attraction, up through a straw.

Before the days of cash registers some clerks used to have the habit of helping themselves from the money drawer. These losses were said to be occasioned by a leak in the money till. We do not know if cash registers have any leaks or not, as none of my bosses has ever run me up against a cash register. But I expect that they can be tinkered with as well as any other old machine.

Twenty-two years ago I was clerk and tinner in a large stove store in Iowa. The boss's wife was there all the time, and she and I could not "haw nor gee." She fired me several times, but I paid no attention to that; so she laid her plans to get her husband to do the firing act. She misplaced the money out of the till several times, with the expectation that her husband would discover the loss and lay it to me. But the old man was too suspicious of her and was too foxy for the old lady. He was watching her, and not me, with the result that he soon found where the money had gone. After that the old woman made it too hot for me. It is better to be in h—l than to war with an ireful female; so at the end of the month I threw up my job in disgust and went on a tramp with a meandering umbrella man.

When a bank cashier helps himself to a bank's money there is said to be a leak in the bank funds. Wish we were a bank cashier; wouldn't we create a leak? Gee, wbiz! We would knock the bottom of the bank vault out in short order.

But it is the leaks as tinnors know them that we desire to discuss more than any other kind; not the leaks that permit matter to flow out, but those that permit undesirable elements to flow in—leaks in the roof. We have studied this subject closely and have decided that such leaks can be divided into four distinct classes. When endeavoring to locate a leak, if one class is not discernible, look for some one of the others. It is a dead sure thing that you must find a leak before you can stop it.

The first on the list we will call the "gravity leak." This is occasioned by a hole, or crack, through which the water flows by its own weight. The next one we will style the "splash leak." This is where ventilators or other openings set down near a flat roof and rain falling heavily breaks into spray and leaks sometimes 2 feet upward into any opening that may be near. This occurs sometimes when a counterflashing has opened out from its proper place, and also under the lower part of some skylights that have openings at the bottom of the glass. This is a cause for leaks which is often overlooked by tinnors.

The next kind of leaks we will name the "drift." These, as the name implies, are occasioned by the rain drifting, by force of the wind, in through openings and cracks that would not otherwise admit the rain. Wall ventilators and roof ventilators with too small caps permit these leaks to occur.

The last on the list are leaks that are caused by capillary attraction, and therefore can be called "capillary leaks." Broken seams in hip valleys are of this kind. Old rusty V-crimped and corrugated iron roofs leak from this cause. Lapped glass in greenhouse work often leaks from this cause also. Dormer windows and eyebrow ventilators, both in tin and slate, and built in on the slope of the main roof, are frequent sources of great trouble because when they were built proper care was not taken to overcome the force of the capillary attraction.

Several years ago we were greatly troubled by what was supposed to be a leak in the skylight built over an open court of a five-story office building. We went to a window that opened into the court during a rain storm and we found that the water was coming down and covering an electric light wire that was introduced through the opening under the lower end of the glass, and was carried across the court to the opposite wall. At the place at which it passed under the edge of the glass it made a slight turn upward over the bead of the water gutter. But this did not prevent the carrying of the water. The water followed the wire half way across the court, up a kink in the wire, where it fell in drops to the stone floor below. We tied a string around the wire where it passed over the top of the gutter and the water dripped off the string into the gutter. This was a leak that was very easily stopped—after we had put in about one day's time on the skylight and accomplished nothing.

About 25 years ago we read an article in the daily papers of a man going around the country selling a patent potato bug exterminator. The package was not to be opened until ready for use, but it was said to be sure death to any bug and only cost 10 cents a package. When the farmer opened his package he found two little square pine blocks with a printed slip between with the legend, "Catch the bug; put him on one of the blocks and hit him with the other." If you are called upon to repair a leaky roof find the leak and then repair it in any old way so that you stop the leaks. And ten chances to one the owner will swear that you made more leaks than you stopped.

ED. S. BURGESS, president of the Burgess Soldering Furnace Company, Columbus, Ohio, has been compelled to shorten his annual summer recreation period, usually spent at Columbus Beach, Indian River, Mich., by several weeks, owing to the excessive demand for the company's productions, especially the Gem Soldering Furnaces. His many friends in the trade may appreciate the fact that a curtailment of the annual fish story will necessarily follow the shortening of a pleasurable vacation.

## FLASHINGS.

It is reported that the Shenango plant of the American Tin Plate Company, at New Castle, Pa., will be enlarged by the removal of the company's Ellwood City plant to New Castle, and its addition to the Shenango works.

LAST month there was held in the City of Mexico a meeting of the shareholders of Mexico's principal operating Tin mine, which bears the rather far fetched name of the Australia & Queensland Tin Mines Company. Favorable reports were made in regard to operations and prospects. It was agreed to increase the capital of the company by issuing 150 shares of stock at \$100 each, for the purpose of purchasing additional machinery. The shares were immediately subscribed for by those present at the meeting. It is asserted that large bodies of Tin Ore have been uncovered in the company's property and that the prospect for its profitable treatment is very favorable. The president of the company is L. La Barra.

THE JUNIATA STEEL & IRON COMPANY, Greencastle, Ind., expect to have their new Tin Plate plant in operation by November 1. It will be a six-mill plant equipped in the most modern style.

A CHARTER has been issued to the Canonsburg Steel & Iron Company, Canonsburg, Pa., with a capital of \$250,000. The directors are John F. Budke, William H. Baxton, George W. Retburg, George B. McNutt and Ralph Marvin of Canonsburg, John M. Watson of New Castle, H. A. Quail of North Starbans, John G. Paxton of Chartiers and R. S. Park of Peters.

THE AMERICAN CAN COMPANY have decided to dismantle their Tin Can factory at Astoria, Ore., and remove the machinery and equipment to the large new factory they are building at Portland, Ore. The Portland factory will probably be in operation by February 1.

THE Star works of the American Tin Plate Company, Pittsburgh, Pa., are reported to be running full. The company's Beaver works, at Lisbon, Ohio, have been shut down. It is the last of their union plants to cease operations.

IN our last issue it was stated that F. B. Reeves would sever his connection with the Philadelphia branch of the Wheeling Corrugating Company. Mr. Reeves advises us that his initials are S. V., and not F. B., as therein given. We gladly make this correction.

SIXTEEN mills at the Laughlin Tin Plate plant at Martin's Ferry, Ohio, have been put at work. Eight mills are still idle on account of a new engine being installed.

THE Sheet mills at the plant of Zug & Co., Limited, Pittsburgh, Pa., are running full in all departments, with a prospect of continuing during the winter.

THE new Bar mills at the plant of the Parkersburg Iron & Steel Company, Parkersburg, W. Va., have been put in full operation and are working very satisfactorily. The concern are operating six Sheet mills, but on three of them Black Plate for tinning can be rolled if necessary.

DURING the next week the wage scale governing Bar Iron, Sheet and Tin Plate mills will be arranged for September and October. It is expected that the average price of Iron Bars shipped out by the mills in July and August will give puddlers an advance in wages. In July and August puddlers were paid \$6 a ton, based on a 1.6 card. In case it is found that the price of shipments for Iron Bars in July and August is 1.70 cents, it will entitle puddlers to an advance of 12½ cents for puddling and finishers 2 per cent. There will no doubt be no change made in the Sheet and Tin Plate scales, as prices on both of these commodities have not advanced for some time, but on Sheets are slightly lower.

It is reported that Eastern capitalists have secured options on lands owned by the Estate of John D. Aukron at Sistersville, W. Va., with a view to locating Steel and Iron Mills, Tin Plate Works, &c.

THE Tin house departments of the Shenango and New Castle works of the American Tin Plate Company,

at New Castle, Pa., are still in operation, but as soon as all the Black Plate is worked up they will be shut down for an indefinite period.

THE SHEET STEEL COMPANY of Pittsburgh have been organized and will apply for a charter of incorporation. The new company have leased the plant of the Tuscora Steel Company at Newcomerstown, Ohio, which contains four hot mills and four cold mills, galvanizing and proofing department. George A. McLean has been elected president and treasurer of the Sheet Steel Company and the offices will be in the Lewis Block, Pittsburgh.

THE AMERICAN SHEET STEEL COMPANY have recently installed at their Aetna-Standard Works, Bridgeport, Ohio, a jobbing mill, which with other jobbing mills added during the last year makes seven jobbing mills at this plant. The American Sheet Steel Company are now installing at the Aetna-Standard Works a three-high jobbing mill of the latest type, which will be in operation in November.

THE YOUNGSTOWN IRON SHEET & TUBE COMPANY of Youngstown, Ohio, have commenced active work on the building of their new Open Hearth Steel plant. The output of this plant will be used by the concern in the manufacture of Sheets and Pipe, as it is the intention of the Youngstown Iron Sheet & Tube Company to manufacture both Iron and Steel Pipe for the market. The company have been making Wrought Iron Pipe for some time and are turning out about 300 tons a day.

ONE steel building, 50 x 150 feet, formerly occupied by the Ellwood Works of the American Tin Plate Company at Ellwood City, Pa., is being removed to New Castle, Pa., and will be erected near the Shenango Works. It will be used for an annealing box and stand factory.

WE are officially advised that the report that the W. Dewees Wood Works of the American Sheet Steel Company, at McKeesport, Pa., would be very much enlarged and three new Sheet mills added is untrue. Beyond the usual ordinary repairs no changes are to be made at these works.

IWAN BROTHERS, Streator, Ill., are calling special attention to their Iwan's Revolving Chimney Top, the merits of which are well known to our readers. These Chimney Tops are claimed to produce a strong and regular draft at all times and have scored a considerable success since they were placed on the market. The firm also manufacture Conductor Pipe Hangers.

## Some Rules for Casting Aluminum.

The following rules for casting aluminum are given by the Foundry:

Pour this metal as cold as possible. Of course, thin castings have to be poured hotter than those of heavier section, but on general principles this rule holds good in all cases. A convenient way of ascertaining the temperature of the metal is as follows: If its color is red, stir with a pig of aluminum until it is white. The melting of the pig will serve as a guide so far. Then dip the end of a cold pig ¾ inch or so into the metal, when the aluminum will chill around the pig, and when the latter is withdrawn from the melted metal it remains like a little cup on the surface of the metal. The time required for this chilled metal to melt gives a good idea of the temperature of the metal in the crucible.

Use sand as dry as possible, and avoid sponging a mold. A little filing on the casting where the mold tears up is more to be preferred than a lost casting. Small bodies of sand nearly surrounded by metal, such as the center cores of small set collars, are almost certain to blow if the sand is a little damp.

Use large sprues and heavy gates. In some cases, however, it will not do to put a large gate on a thin casting, as the gate sometimes draws from the casting.

Pour rapidly. Just "dump" the metal in. Aluminum is not as liable to wash away portions of the mold as other metals, on account of its lightness.

Ram the molds very softly. It is not necessary to ram these nearly as hard as for iron, as aluminum is but one-third as heavy. Soft ramming will very often prevent the breakage of castings when they "set." The reason for this is that aluminum, just after it solidifies, is very weak and crumbly, and will scarcely bear its own weight. Vent all molds well.

## THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

### NAME WANTED.

If the correspondent at Linesville, Pa., who asks a question about the boiling of water, will send us his name, in accordance with the request printed at the head of this department, his communication will receive prompt attention.

The number of unsigned communications we are constantly receiving impels us to reiterate the statement that we must refrain from answering inquiries unless accompanied by the correspondent's name and address.

### HEATING FROM RANGE BOILER.

From E. B. S., Gettysburg, S. D.—I should like help on the proposition to connect a water back in a range by means of 1-inch pipes, with a hot water storage tank about 4 feet distant. This tank is close to the wall of the bedroom, which is 14 x 18 feet in size with a 9-foot ceiling. Now what I desire to know is, can I heat this room by substituting tees for the ells and carry the piping to a bedroom radiator? What size should the pipe be to supply the radiator and how much surface should the radiator contain to heat the room sufficiently? Also, would it be practical to expect so much from the kitchen fire?

**Note.**—The first question to be decided is whether or not the fire chamber of the stove is large enough to do the baking, the cooking on the top of the stove, heat the water for domestic purposes and still have reserve power for heating the water for warming the bed chamber? If the fire chamber is large enough then the question will be whether or not the water back exposes surface enough for heating so much water. The size of the family and the way the kitchen stove is run will also bear vitally on this question. If the family is small and the fire is run very moderately, it is improbable that water will be heated sufficiently for the purpose. These questions can all be best answered by our correspondent.

In the absence of more detailed information the only method of arriving at the size of radiator that will be needed in the bed chamber is to allow 1 square foot of heating surface for every 30 cubic feet of space, and a little calculation will show that 75 feet of surface will be needed for the room. In consequence, it would be better to use a radiator or a miter coil connected with manifold headers, than to use a return bend coil. One-inch pipes are as small as should be used in connection with the apparatus under construction, and they will be none too large for the work. The pipe for heating the radiator should be carried along the ceiling, from the tee which our correspondent proposes to insert, to the radiator where it should drop down and connect with it. The return pipe may be carried around the floor of the room through the wall and rise to the cold water pipe connecting with the water back. Some provision must be made for the escape of the air in the pipe along the ceiling, and if the high point is made in the kitchen, a pet cock can be placed in it to allow the air to escape when it accumulates to such an extent as to interfere with the circulation. The book, "Kitchen Boiler Connections," which can be furnished by our Book Department, has two chapters treating on this subject.

### CAPACITY OF VESSELS.

From M. J. M., Palestine, Texas.—I should be much obliged if you could give me a simple way of determining the capacity of any vessel.

**Answer.**—The Metal Worker Shop Card No. 5, which can be furnished by our Book Department, gives the capacity of cylinders from 4 to 72 inches in diameter and from 1 to 72 inches

in depth. To find the capacity of a flaring vessel add together the squares of the two diameters and the product of the two diameters, and multiply the sum by one-third the perpendicular height and .07854. If the dimensions of the vessels are taken in inches, the result will be the capacity in inches, which, divided by 231, will give the capacity of a vessel in gallons. From this rule our correspondent will also be able to calculate the size of vessels to hold a given number of gallons.

### HOW CHIMNEYS ARE CLEANED.

From O. W. T., Macon, Ga.—My business consists of furnishing stove repairs and repairing stoves and I now wish to add the cleaning of chimneys. The fuel used here is soft coal in grates and our buildings are two and three stories high. Can you give me any information as to how chimneys are cleaned and what appliances are used? These chimneys are usually very small, and as I have never seen an expert chimney sweep work, I am desirous of securing information.

**Note.**—The tools required for the work can be purchased from any brush manufacturer, who will make them to order when the sizes required are known. Where the chimneys are small the brushes are made somewhat like a wheel, the wooden part in the center being round, and the bristles or steel wires of which they are composed radiate from the center. If the chimneys are oblong some advantage attends the use of oblong or oval shaped brushes. These brushes should have either a hole through the center or an eye bolt securely attached to each side for fastening a rope. In use a rope is dropped from the top of the chimney and the brush fastened to it by the operator at the bottom. After this is done, if the grate from which the chimney leads is located in a parlor or handsomely furnished room, the chimney sweep should cover the opening with a clean canvas to prevent the soot, which may fall as the brush is drawn up through the chimney, from blowing out into the apartment. Should the brush become stuck by any obstruction, the rope that is fastened to the inside will allow the operator in the room to aid the operator on the roof in dislodging it. Experience enables the chimney sweep to do this work without causing any dirt or making it necessary to remove any of the fine furnishings from the room in which the grate is located. The advantage in the use of ropes and brushes of the construction suggested is that they can be drawn through chimneys with off sets where sectional rods attached to the same brushes could not be passed round the turns and bends in the chimney.

### A NOISY SERVICE PIPE.

From L., Sandwich, Ill.—Your valued journal comes to our store regularly, and we would like to ask a question in the Letter Box about the noise in a plumbing system. The system in question is located about 200 feet from the water main and is supplied through a ¾-inch pipe. This ¾-inch pipe also supplies a water tank located about half way between the main and the plumbing system. This tank supplies water free and is left with an overflow running all the time. When the water is turned on so that the tank will fill and keep running over there is a noise all the time at the plumbing system and we have been unable to stop it. Just as soon as the water is shut off from the tank the noise ceases. Is there any way of stopping the noise and still allowing the water to flow continuously?

**Note.**—It is the opinion of previous contributors to the Letter Box that noise under such conditions is always due to some loose part, either at the watering tank or in some fixture on the plumbing system in the building. The flow of water causes a very slight vibration, due to the slight variation in the pressure caused by the flow. This vibration, however, is sufficient to keep the loose part in motion, and it has been found that the noise so started is inclined to increase and become very loud on a long run of pipe. The remedy is to locate the loose part and tighten it up, or to substitute cocks or faucets constructed without any loose parts that are likely to become loosened and subject to the vibration, causing noise.

### HAMMERING IN RANGE BOILER.

From J. D., Newport, N. H.—Can *The Metal Worker* give me any explanation of the hammering in a range boiler under the following conditions? As soon as the hot water faucet is opened the noise begins, but it ceases if the water runs a few minutes. There is a water pressure on the boiler of 100 pounds per square inch. I had the full pressure on the boiler, with a four-pipe brass coil in the range. I changed that and put in a two-pipe coil, and also connected a pressure reducing valve to the supply pipe, so that the boiler is now operated under about 40 pounds pressure; but the noise still continues. I have looked for obstructions and low places in the pipes leading to and from the range, but have found none. I have consulted your book, "Kitchen Boiler Connections," and found similar cases and applied the remedies suggested, but have not discovered the real cause of the trouble yet.

Note.—We shall be glad if our readers will give their views on this subject. In the meantime we would suggest that possibly the brass coil still has too large a heating capacity for the boiler with which it is connected and for the amount of water used by the family having the range in use. This would cause the overheating of the water, and as soon as the pressure in the boiler is reduced by the opening of the hot water faucet steam is generated to condense and cause the noise. In many instances, however, a loose part in some fixture which vibrates under a modification of the pressure, such as would occur when the hot water faucet is open, will cause a noise, which may be at some point quite distant from the seat of the cause. Examination of the delivery tube should be made, to see that it is not closed at the bottom through sediment, or by being bent, and also that it has as large a capacity as the hot water service pipe, so that the cold water can flow into it as fast as the hot water can be forced out, by means of steam or any other cause, through the hot water service pipe. We make these suggestions, but would be glad if our practical readers, who are every day brought into contact with such problems, and who have a better opportunity of learning the cause and the remedy, will lend their assistance to this correspondent.

### TINNING CAST IRON.

From E. P., Washington, D. C.—Please let me know if the following statement in regard to tinning cast iron is correct; and if wrong, point out where and how. I have never had any experience in tinning cast iron and would like to find some good simple way. The statement is as follows: "To tin cast iron the castings must first be cleaned in a solution of hydrochloric acid, 1 part, and water, 20 parts. Then immerse in muriatic acid, sal ammoniac and water from three to four hours, and then take out. They must be washed in clean water immediately to prevent oxidization. Next dip in muriatic acid, 1 part; water, 40 parts, for two or three seconds, then in muriate of zinc and sal ammoniac; then dip in melted tin, which should be covered with a flux of muriatic acid and sal ammoniac, after which dip in kerosene oil and wash in hot water."

Answer.—While there is no essential fault to find with the above method for tinning cast iron articles, we offer another, which is, possibly, a little more definite. To be successful in coating with tin the castings must be absolutely clean and free from sand and oxide. They are usually freed from imbedded sand in a rattler or tumbling box, which also tends to close the surface grain and give the articles a smooth metallic face. The articles are then placed in a hot pickle of 1 part of hydrochloric acid to 4 parts of water, in which they are allowed to remain from one to two hours, or until the recesses are free from scale and sand. Spots may be removed by a scraper or wire brush. The castings are then washed in hot water and kept in clean hot water until ready to dip. For a flux dip in a mixture composed of 4 parts of a saturated solution of sal ammoniac in water and 1 part of hydrochloric acid, hot. Then dry the castings and dip them in the tin pot. The tin should be hot enough to quickly bring the castings to its own temperature when perfectly fluid, but not hot enough to quickly oxidize the surface of the tin. A sprinkling of

pulverized sal ammoniac may be made on the surface of the tin or a little tallow or palm oil may be used to clear the surface and make the tinned work come out clear. Some operators again dip in a pot of hot palm oil or tallow at a temperature above that of the melted tin, for the purpose of draining the excess of tin and imparting a smooth, bright surface to the castings. As soon as the tin on the castings has chilled or set they should be washed in hot sal soda water and dried in sawdust.

### HOW CAN HOT WATER BE SUPPLIED?

From E. A. S., Renton, Wash.—Will *The Metal Worker* kindly advise us how to connect a heater coil and a tank to supply hot water for a hotel? A hotel range that is now in use is to be provided with a coil made of 1½-inch iron pipe measuring 10 inches one way and 15 inches the other, and having four turns. As there is no city water supply, it will be necessary to furnish an open tank, which will have to be filled by means of a force pump from the well. I suppose that the tank will have to be placed outside of the kitchen to allow the steam to escape. I shall be glad to learn the different means of connecting the coil and the tank to afford a good circulation.

### PATTERN FOR OVAL FOOT TUB.

From H. C. S., Baltimore, Md.—Will you please publish in *The Metal Worker* the method of drawing the pattern for an oval foot tub?

Answer.—Problem 132, "The Envelope of the Frustum of a Cone, the Base of which is an Elliptical Figure," in "The New Metal Worker Pattern Book," shows how to develop the pattern for the sides of the tub. The pattern for the bottom is the same as the plan view of the bottom of the pan.

### REPAIRS WANTED FOR NEW ENGLAND RANGE.

From F. M. B., Philadelphia.—Answering the inquiry of "W. L. S.," in *The Metal Worker* of September 6, we beg to advise you that upon looking over our records we find that there is a concern called the New England Stove Company of Taunton, Mass. Probably this is the concern who manufacture the range for which "W. L. S." desires to get repairs. We hope this information will be of benefit to him.

### A Floating Sample Room.

The Commercial Oriental Expedition Company will start the steamship "Oregon" from Seattle, Wash., on November 15 on a six months' tour, loaded with samples of American products and having as passengers the representatives of the manufacturers and dealers. The markets of Eastern Asia, South Africa, Australia and Pacific islands will be visited. The purpose of the company was brought to the attention of the Seattle Chamber of Commerce and received the hearty indorsement of that body. The promoters of the enterprise believe that to open up new markets it is absolutely essential that extensive displays of samples as well as personal solicitation be made, and it is to this end that they will place the "Oregon" at the disposal of enterprising American merchants who are expected to convert her into a gigantic floating exhibition and sample room. The American consuls at the several points to be visited will be advised fully as to the objects of the expedition, the date of arrival and departure from each port and other data necessary to a proper co-operation.

The lower deck of the "Oregon" will be electrically lighted and fitted with every convenience for exhibition purposes. The deck will be used for no other purpose throughout the voyage and will be open to the public at all reasonable times. The vessel will have on board launches for carrying passengers and interested townspeople between ship and shore at places where wharfage facilities may be inadequate. Power will be furnished to firms requiring it for the proper exhibition of refrigerator plants, electric lighting or ventilating appliances. Two thousand dollars will be charged each exhibitor for the entire voyage, and for this amount there will be supplied in addition to transportation floor space on the exhibition deck to the extent of 2000 pounds.

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** has been dull, and is about  $\frac{1}{4}$ c. lower in price.

**Copper** is quiet and unchanged.

**Pig Lead** continues firm, with a moderate volume of business.

**Spelter** is still strong, with a continued scarcity of spot metal.

**Antimony** is quiet and unchanged.

**Nickel** is in good demand at unchanged prices.

**Aluminum** continues in active demand at former prices.

**Tin Plates** are dull as to large business, but more active in a retail way; prices unchanged.

**Sheets** are in rather better demand, with prices somewhat irregular.

**Scrap Iron** is very strong and somewhat higher.

**Scrap Brass and Copper** have stiffened.

**Foundry Iron** continues scarce, with prices nominal.

**Sheet Copper** is unchanged and in fair demand.

**Sheet Zinc** is moderately active and prices very firm.

**Hardware** shows increased activity, with prices well maintained.

**Steam Gauges** have been materially advanced in price by manufacturers.

**Roofing Papers** are firm and active.

**Sad Irons** have been advanced in price.

**Wire Nails** are more active and are firm in price.

**Cut Nails** are in moderate demand at former price.

**Cordage** is weak and low.

**White Lead** is more active and prices firm.

**Linseed Oil** has been reduced 3c. a gallon.

**Spirits Turpentine** is moderately active and unchanged

**Spelter.**—This metal is quiet. Spot is still scarce and very firmly held. Jobbers quote good Western brands in small lots at  $6\frac{1}{2}$ c. to  $6\frac{3}{4}$ c. per lb. St. Louis advises report that the demand for Spelter shows a considerable decrease there and that prices have eased somewhat in consequence.

**Sheet Zinc.**—The demand for Sheet Zinc is of the usual proportions. Prices are firm and unchanged at  $6\frac{3}{4}$ c. per lb. for 600-lb cask lots, and  $7\frac{1}{4}$ c. to  $7\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—No change is noted in this metal. Cookson's in small lots is selling at 10c. to  $10\frac{1}{4}$ c. per lb., Hallett's at  $8\frac{3}{8}$ c. to  $8\frac{3}{4}$ c. and U. S. at  $8\frac{1}{4}$ c. to  $8\frac{1}{2}$ c.

**Nickel.**—Is unchanged. Small lots rule at about 55c. to 60c. per lb.

**Aluminum.**—The demand for Aluminum is referred to as good and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market for Tin Plates has been dull and uninteresting as regards large business. There has been an almost entire absence of any important buying, and prices are without change. The American Tin Plate Company quote for delivery up to December 1 on the basis price ruling for the past year. Jobbers report more activity in the retail trade, there being quite a brisk demand in this vicinity from the smaller consumers, the demand covering all classes of Plates. Retail prices are practically unchanged, although there is said to have been some cutting on the part of certain holders who desired to secure business. This price cutting, however, is regarded as unjustifiable, as stocks of Plates are not excessive, and the closing down of so many mills will prevent any unwieldy surplus in the near future. Jobbers, as a rule, continue to quote American Bessemer Coke Plates, IC, 14 x 20, at \$4.70 to \$4.90 per box in moderate sized lots, delivered at New York and corresponding points. An advance of  $1\frac{1}{2}$  pence is reported in the price of Welsh Plates, the quotation being now 12 shillings 6 pence, Swansea.

**Sheets.**—The demand for Sheets is said to have improved somewhat, and manufacturers are beginning to expect a larger business during the fall and winter months. A number of mills are idle, which is cutting down the output of Sheets considerably. This ought to have a beneficial effect on the market, which has been somewhat soft of late. Competition in this trade has become very apparent, and some of the independent mills are understood to have been naming considerably lower prices than those maintained by the principal Sheet interest, who have not changed their quotations. In a retail way, business has picked up to some extent during the week, although the demand for Light Sheets and Galvanized Sheets is reported to be still rather tame. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at 3.60c. to 3.65c., and No. 27 Galvanized Sheets at 4.45c. to 4.60c.

Chicago advices are as follows: The week has brought forth little if any improvement in the market for either Galvanized or Light Black Sheets. The offerings are liberal and the demand only moderate. For Heavy Sheets there is a fair inquiry and the market is steady. No. 27 Black Sheets in small lots from store are offered at 3.25c. to 3.35c., Chicago, and Galvanized Sheets at 4.30c. to 4.40c. for No. 27.

**Old Metals.**—The demand for Scrap Iron is active, and supplies are not excessive; consequently prices have advanced. Scrap Brass and Copper are rather stiffer. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                              |                             |
|------------------------------|-----------------------------|
| Heavy Copper.....            | per lb. 10 $\frac{1}{2}$ c. |
| Light and Tinned Copper..... | per lb. 9 $\frac{1}{2}$ c.  |
| Heavy Brass.....             | per lb. 8 $\frac{1}{2}$ c.  |
| Light Brass.....             | per lb. 6 $\frac{1}{2}$ c.  |
| Lead.....                    | per lb. 3 $\frac{3}{4}$ c.  |
| Tea Lead.....                | per lb. 3 c.                |

## METAL MARKET.

NEW YORK, September 12, 1902.

**Pig Tin.**—Business throughout the week in the Tin market has been very quiet. Consumers are backward in buying, transactions being on a hand to mouth basis. In view of the fact that the large consumers are still well supplied through old contracts, and that a considerable proportion of the Tin Plate mills are idle, the lack of demand is natural. Prices have been easing off under this condition and also on account of heavy arrivals. With an occasional upward spurt the market has settled to a still lower level than a week ago. Jobbers' prices are about  $\frac{1}{4}$ c. less than those quoted in our last report, Straits Pig in small lots being quoted at 28c. to  $28\frac{1}{2}$ c. per lb. The London market is also easier. Arrivals thus far this month have amounted to 1730 tons and it is estimated that 2984 tons are afloat.

**Copper.**—After the dullness of the last few weeks a short lived "boom" set in at the end of last week, caused by the appearance of some favorable statistics of the Copper supply. The boom did not survive any time, however, and prices again settled down to about the level held for some time past. Meanwhile a considerable amount of Copper changed hands and some purchasers found that they had acquired more metal than they could well take care of, consequently were obliged to throw it again on the market at some loss. Lake Ingot in small lots is quoted at about  $12\frac{1}{2}$ c. to  $12\frac{3}{4}$ c. per lb. and Casting Copper at  $12\frac{1}{4}$ c. to  $12\frac{3}{8}$ c.

**Sheet Copper.**—There is no change in this department. The demand for Sheet Copper is of fair proportions and prices are unchanged on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—The market is quiet and firm, with a fair volume of trade. American Pig in small lots is quoted at 4.45c. to  $4\frac{1}{2}$ c. per lb. St. Louis advices indicate that the demand for Pig Lead in that market is on a very moderate scale, with prices unchanged.

|                                        |         |                  |
|----------------------------------------|---------|------------------|
| Zinc .....                             | per lb. | 2½c.             |
| Pure Aluminum Sheet.....               | per lb. | 22 c.            |
| Cast Aluminum.....                     | per lb. | 17 c.            |
| No. 1 Pewter.....                      | per lb. | 18 c.            |
| No. 2 Pewter.....                      | per lb. | 9 c.             |
| Tin Plate, per gross ton.....          |         | to \$5.00        |
| Wrought Iron Scrap, per gross ton..... |         | \$15.00 to 16.00 |
| Heavy Cast Scrap, per gross ton.....   |         | 14.00 to 14.50   |
| Stove Plate Scrap, per gross ton.....  |         | ..... to .....   |
| Burnt Iron, per gross ton.....         |         | 8.50 to 9.00     |

### The Scully Stocks of Sheets.

The Scully Steel & Iron Company, Halsted and Fulton streets, Chicago, have one of the largest warehouses in the country, specially arranged to carry stocks of Sheets, Plates and other forms of manufactured Iron and Steel. It is located with direct track connections with leading railroad lines, thus enabling shipments to be made with dispatch and at minimum cost for handling. Some idea of the heavy stock carried by this company is conveyed by the full-page advertisement to be found in another part of this issue. This advertisement relates exclusively to Sheets, enumerating the quantity on hand of every size of Black Sheets of No. 14 gauge and lighter and of every size of Galvanized Sheets of No. 16 gauge and lighter. The list is worth studying by all users of Sheets.

### THE PIG IRON MARKET.

NEW YORK.—There are reports of further heavy purchases of foreign Pig Iron by importers, but we are unable to verify them. Consumers are buying moderate quantities of foreign Iron from importers right along. The most interesting development during the week has been the purchase by Rogers, Brown & Co., Pig Iron merchants of this city, of the Foundry Pig Iron product of the Dominion Iron & Steel Company of Sydney, C. B., for a period of six months. It is estimated that the tonnage amounts to about 7000 tons per month. There is practically no domestic Foundry Pig Iron available for prompt or early delivery, and the Southern railroads have advanced the rail and water freight to New York to \$4.25. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity: No. 1 Foundry, \$23.25 to \$23.50; No. 2 Foundry, \$22.25 to \$22.50; No. 3 Foundry, \$21.50 to \$22.

CHICAGO.—The abnormal conditions prevailing have resulted in a chaotic market, with prices irregular, covering a wide range even on the same grade and brand of Iron. It is difficult, if not entirely impossible, to secure appreciable quantities of Iron for the first six months of 1903 of either Northern or Southern brands. Most of the business doing seems to be skirmishing for spot Iron, or its equivalent, shipments during the next 30 days. A few car lots of Southern No. 1 Foundry have been sold at \$27.65 to \$28.15, and No. 2 Foundry has been selling within 50c. of No. 1. Local No. 2 Foundry commands \$27 to \$28 for immediate delivery. The Coke famine is becoming more and more potent, affecting producer and consumer alike. More furnaces in the Central West are banked, and foundries are hampered by the intermittent fuel supply, with the result that both the production of Pig Iron and the melting for Castings vary considerably from day to day. Under the circumstances the prices prevailing, even for the first six months of next year, are of a nominal character.

PHILADELPHIA.—The excited feeling so strongly in evidence some time ago is abating materially. Consumers begin to realize that Iron will be forthcoming, and when prices get to \$23 to \$24 per ton no prolonged shortage will be feared. In short, the outlook denotes that high water mark in prices has been reached. This is indicated by a less urgency to place orders for next year's deliveries, as well as less running around for spot lots. The latter are supplied to a great extent by English and Scotch Irons, shipments of which appear to be so arranged that there is nearly always a cargo in port, or one at hand. American No. 2 X Foundry for this and next month's shipments readily taken at \$23 to 23.50.

Sales have been unusually heavy, small and medium sized lots comprising the bulk of the business, and mostly for foreign Iron. Prices are just about as they were a week ago, No. 2 X Foundry being \$23 to \$23.50 for this year's deliveries, \$22 to \$22.50 for the first quarter of 1903, and 50c. to 75c. less for deliveries covering the whole of 1903. Scotch Iron sells at \$22.50 to \$23.50 on dock, duty paid, and Middlesbro at \$20.50 to \$21. These quotations are for small lots. Car lots could be done at lower figures.

PITTSBURGH.—Unless the Coke situation materially improves within the next two weeks there is no doubt that a very large tonnage of foreign Iron will be brought into the Pittsburgh district. Actual negotiations are now under way for the importation of at least 150,000 tons of foreign Bessemer, which is to be divided among three or four large Steel concerns, who find it utterly impossible to get Pig Iron as fast as needed for their Steel works. The Coke situation, instead of improving, seems to be getting worse, and a number of furnaces that have had to bank quite often recently will blow out unless the supply improves in a short time. Little or no Foundry Iron is for sale, but not much is wanted, as consumers are pretty well covered. Prompt Foundry Iron will bring very close to \$23, Pittsburgh.

CINCINNATI.—The amount of offerings of Iron for delivery in 1902 and 1903 is so small as to hardly justify a quotation. The little that is selling is on the basis of \$21.75 to \$22.50, Birmingham. Northern Irons for this year's delivery are in the main unchanged. The market for this year's delivery is undoubtedly higher than a week ago, and the minimum quotation to-day on No. 2 Southern Iron is on the basis of \$18.50, Birmingham, at which figure quite a limited amount of metal is contractable. We quote f.o.b. Cincinnati for 1902 delivery as follows:

|                                |                    |
|--------------------------------|--------------------|
| Southern Coke, No. 1.....      | \$24.50 to \$26.25 |
| Southern Coke, No. 2.....      | 24.00 to 25.75     |
| Southern Coke, No. 3.....      | 22.75 to 24.50     |
| Southern Coke, No. 4.....      | 22.25 to 22.50     |
| Southern Coke, No. 1 Soft..... | 24.50 to 26.25     |
| Southern Coke, No. 2 Soft..... | 24.00 to 25.75     |
| Ohio Silvery, No. 1.....       | 29.10 to 29.60     |
| Ohio Silvery, No. 2.....       | ..... to .....     |
| Lake Superior Coke, No. 1..... | 26.10 to 26.60     |
| Lake Superior Coke, No. 2..... | 25.60 to 26.10     |
| Lake Superior Coke, No. 3..... | 25.10 to 25.60     |

ST. LOUIS.—The Pig Iron market is very quiet, and while there is some little inquiry the indications point to the demand being satisfied for some time ahead. What business of importance comes up is for the first half of 1903. Eighteen dollars, Birmingham, for No. 2 Foundry seems to be the quotation generally adhered to for delivery the first half of next year. The following is the range of prices current for cash, f.o.b. St. Louis:

|                              |                    |
|------------------------------|--------------------|
| Southern, No. 1 Foundry..... | \$21.50 to \$24.00 |
| Southern, No. 2 Foundry..... | 20.75 to 23.25     |
| Southern, No. 3 Foundry..... | 20.25 to 22.75     |
| Southern, No. 4 Foundry..... | 19.75 to 22.25     |
| No. 1 Soft.....              | 21.25 to 23.75     |
| No. 2 Soft.....              | 20.75 to 23.25     |

### CHICAGO REPORT.

Scrap Iron and Steel.—The market has developed a decidedly stronger tone, supplies being inadequate, and dealers finding a more ready outlet are buying at 50c. per ton advance on all the leading articles. The following are the prices paid by dealers in carload lots, Chicago:

|                                                        | Per net ton.       |
|--------------------------------------------------------|--------------------|
| Country Wrought Scrap.....                             | \$16.00 to \$16.50 |
| Machinery Cast.....                                    | 14.50 to 15.00     |
| Malleable Cast.....                                    | 13.00 to 14.00     |
| Stove Plate (free from burnt).....                     | 11.00 to .....     |
| Burnt Iron and Grate Bars.....                         | 9.50 to 10.00      |
| Sheet Iron and Hoops.....                              | ..... to 10.00     |
| Flow Steel.....                                        | 13.00 to 13.50     |
| Breaking Stock.....                                    | 12.50 to 13.00     |
| Old Boilers—whole (Iron).....                          | 9.50 to 10.00      |
| Old Boilers (Iron) cut in single Sheets and Rings..... | 14.00 to .....     |
| Old Gas Pipe and Boiler Tubes.....                     | 13.50 to 14.00     |
| Cast Borings .....                                     | 9.00 to 9.50       |
| Turnings .....                                         | 12.50 to 13.00     |
| Horseshoes .....                                       | 13.50 to 14.00     |

Old Metals.—Both Copper and Brass have stiffened in sympathy with primary markets and prices are ¼c. to ¾c. higher. Zinc and Lead have continued firm but quiet. Dealers have advanced buying prices of Copper

Wire, Copper Bottoms, Clips, Red and Yellow Brass.  
The following are the prices paid in this market:

|                            | Per lb.   |
|----------------------------|-----------|
| Copper Wire and Heavy..... | 10 3/4 c. |
| Copper Bottoms.....        | 9 1/2 c.  |
| Copper Clips.....          | 10 1/4 c. |
| Red Brass.....             | 10 1/4 c. |
| Yellow Brass.....          | 7 3/4 c.  |
| Red Brass Borings.....     | 9 1/4 c.  |
| Yellow Brass Borings.....  | 7 1/4 c.  |
| Light Brass.....           | 6 3/4 c.  |

**Old Rubber.**—A little firmer feeling has resulted from less free offerings and an improved outlet. Dealers buy at the following prices, Chicago:

|                            | Per net ton. | Per lb.  |
|----------------------------|--------------|----------|
| Garden Hose.....           | \$25.00      | .....    |
| Air Brake Hose.....        | 47.50        | .....    |

| Outside Tubing.....        | .....        | 5 c.     |
| Black Rubber.....          | .....        | 4 c.     |
| White Rubber.....          | .....        | 8 1/2 c. |

**Rags.**—The receipts have been only moderate and with a fair outlet the market has continued to rule steady, without essential change in prices. Dealers are buying County Mixed Rags at 75c. to 85c. per 100 lbs., Chicago delivery.

**Anthracite Coal.**—It is impossible to give any reliable quotations on Coal of any kind or size. Few dealers have any Coal to offer, but there are reports that sales have been made at prices ranging from \$7 to \$10 per ton on track. There is scarcely a local dealer who has the temerity to hazard an opinion concerning the market, they being apparently as much at sea as are consumers.

## THE HARDWARE TRADE.

There are indications of increased activity in the purchase of Hardware. Orders are coming in to manufacturers in very satisfactory number and volume, especially considering the fact that the jobbing trade covered their requirements liberally some time ago. Both jobbers and retailers are preparing for a business of good volume during the fall. The general conditions of prosperity and the way in which trade kept up during what are usually regarded as the dull months justified this. There continues to be, notwithstanding the opportunity which the summer afforded for the clearing of order books, much difficulty in getting goods of various kinds, the manufacturers being unable to make anything like prompt shipments in several lines. The fall season is, in fact, entered upon with back orders on many of their books and with warehouses practically empty. There still continues to be much correspondence with a view to hurrying up shipments. Some prominent jobbing houses are urging their customers to purchase the goods needed for fall and winter trade at an early date in order to avoid delay and disappointment. The manufacturers are handicapped in the turning out of their products by the difficulty in many cases of obtaining raw material, and in a good many factories strikes and labor disturbances have interfered with the regular operation of the works. The active demand and the profitable business which is doing, for manufacturers are obtaining more adequate margins of profit than has often been the case, have the effect of inducing a good deal of enterprise in the way of increasing manufacturing facilities. This is the case both with factories which are being extended and in the installation of new plants. In this way the producing capacity of the trade is being constantly increased, but up to this time the demand in many lines exceeds the supply. With the prevailing prosperity the trade are buying such goods as they require without questioning as to the stability of prices, but are refraining from placing speculative orders, desiring to be on the safe side when the reaction comes. The slight weakness which characterizes a few lines which have been high or in which new competition has interfered with association control is regarded as a desirable feature and not indicative of any general weakness in the market, which continues to be pervaded by a strong and confident tone.

## NOTES ON PRICES.

**Cast Iron Soil Pipe and Fittings.**—It is reported in the trade that prices on Cast Iron Soil Pipe and Fittings are about to undergo an advance. It is said that the demand, instead of diminishing as the summer drew to a close, has had a directly opposite effect and that the manufacturers are now in a worse condition than before regarding the filling of their orders. A report is current this week that one manufacturer was compelled to pay \$30 per ton for spot Iron, which he absolutely had to have to keep his foundry going. This same manufacturer is reported to have covered himself up to the end of the first quarter of next year for Pig Iron at \$16.50 per ton, and up to the end of the first half of next year at \$18.25 per ton, but regardless of all raw material he has bought, he is still unable to fill his present wants without paying exorbitant prices for the raw material. With these conditions prevailing there is every likelihood of a radical change taking place in a very short time in the price of all goods manufactured from Pig Iron.

**Lead Traps and Bends.**—The Union Lead & Oil Company, with offices at 32 Liberty street, New York, and whose factory is at 81 Front street, Brooklyn, have issued a price-list of Drawn Lead Traps and Bends. The list is in every respect the same as that issued June 3, 1901, by the Lead Trap Manufacturers' Association. It is said that the new concern have been endeavoring to purchase the plants of all the other manufacturers and have devoted considerable time and money to that end, but without success. They now announce that they are "Independent of all pools or combinations to control prices."

**Steam Gauges.**—The manufacturers of Steam and other Gauges, who for some time past have been carrying on a ruinous competition, came to an understanding September 5 by which prices have been advanced so that a legitimate profit can be made by the manufacturers. Before the last era of low prices began the base discount was 60 per cent., which has now been placed at 65 per cent., the extras being determined by the class of buyer and the volume of his business. Prices previous to the change last week had gotten as low as 80 and 10 per cent. in extreme cases. While the present prices show advances in some instances of over 75 per cent. it is claimed by the manufacturers that prices in such cases had been cut to less than manufacturers' cost, especially on 5-inch Gauges.

**Roofing and Building Papers.**—The market for Building and Roofing Papers is in a normal condition so far as prices are concerned, but there is plenty of business and manufacturers are slow in executing orders; consequently there is no special reason for cutting prices. Dealers in close touch with the trade in these lines say the consumption of Tarred Roofings, &c., is increasing all the time, a situation that is not explained by the natural increase due to good business conditions. A large part of this growth is attributed to the supplanting of Tin roofs by the various kinds of Tarred and Asphalt Roofings, both regular and prepared. One reason given for the change is the inferior lasting qualities of Tin Plate made from soft steel as compared with the tough Charcoal Iron Black Plate which years ago was the base of the tinned or terne sheet. The following quotations now represent the market for this class of Papers, viz.: Tarred Single Ply Roofing Felt, \$32 per ton; two ply, 55 cents, and three ply, 77 cents per roll, for less than carloads in New York or the metropolitan district. Slaters' Felt under the same system of prices is 80 cents per roll of 40 to 45 pounds each. Rosin Slized Sheathings are quoted as follows: Light, 40 cents; Medium, 50 cents, and Heavy, 60 cents per roll of 500 square feet, in less than carloads. Deafening Felt, 9, 6 and 4 1/2 square feet per pound, is now quoted \$42 per ton, without regard to quantity.

**Sad Irons.**—For some time past the Sad Iron market has been gradually stiffening, owing to the increasing cost of the raw material and the large demand made upon the manufacturers. A further slight advance has

recently been made in this line, the tone of which continues steady and strong.

**Wire Nails.**—Jobbers have received an increased number of orders during the week, and more disposition is shown on the part of some of the trade to place contracts for future deliveries. A fair business is being done in small lots from store. Jobbers' assortments are somewhat broken, owing to delays in transportation. Small lots of Wire Nails from store, New York, are quoted at \$2.25 to \$2.30 per keg.

**Cut Nails.**—The demand for Cut Nails in the New York market is modest. Small lots from store are quoted at \$2.30 per keg.

**Cordage.**—Owing to the weakness of the Rope market, to which reference was made last week, some low prices have been quoted on Sisal Rope, as a result of which a large amount of business was booked and the market has stiffened up, but without an advance upon previous published quotations. Quotations for 7-16 inch and larger are about 10 cents for Sisal and 13 cents for Manila Rope.

**White Lead.**—The demand for White Lead in Oil for prompt delivery, also for forward shipments, shows an increase, and the consumption for the fall months promises to be larger than ever. Under the circumstances the market is firm. White Lead in Oil from store in moderate size lots is quoted at 6½ to 6¾ cents per pound.

**Linseed Oil.**—Reports of frost had a temporary stiffening effect upon the Oil market early in the week, but a large seed crop and the anxiety of holders of Oil to sell resulted in a reduction of 3 cents a gallon in the price of City Raw by manufacturers. Jobbers now quote City Raw in small lots at 58 to 58½ cents per gallon. There is a fair movement of Oil in small lots, but as still lower prices are anticipated only immediate requirements are being covered.

**Spirits Turpentine.**—The local Turpentine market is moderately active, purchases being confined to comparatively small lots. The tone of the Southern market is somewhat weaker, but the holders here are firm in their views. Turpentine in small quantities is quoted at 48 to 48½ cents per gallon.

TRADE NOTES.

THE CROWN POINT GRAPHITE COMPANY of Bath, Maine, have been incorporated with an authorized capital stock of \$1,000,000, to mine Graphite. The president of the company is Edward A. Clark of Boston, Mass., and the treasurer Nathaniel E. Rankin of Lawrence, Mass.

THE CHARLES S. McNALLY METAL COMPANY, Trenton, N. J., have been incorporated with an authorized capital of \$200,000 by Charles S. McNally, Samuel Krekstein and Peter Backes to manufacture Metals.

THE ROYAL MFG. COMPANY, 408 Commerce street, Philadelphia, Pa., have issued Catalogue No. 8, covering their Metal and House Furnishing Specialties. Among these are Fryers and Drainers, Frying Baskets, extra deep Hotel Fryers, Hotel Lard or Grease Pans and improved Henis Self Basting Broilers.

A NEW catalogue is issued by the Philip Carey Mfg. Company of Lockland, Ohio, devoted to Carey's Magnesia Flexible Cement Roofing. This is put up in rolls, the body of which is a strong woolen felt, on top of which is a soft, flexible body of asphalt cement composition, tempered to any range of heat and cold. This is protected by a strong burlap firmly imbedded into the upper surface. The top dressing consists of a heavy elastic paint finish. The catalogue shows the method of applying this roofing material, and also the cement used for making tight laps and joints and for repairing. Interspersed with the text are engravings of a number of buildings on which this roofing material has been used.

E. BISSELL & Co., wholesale auctioneers, 12 Murray street and 15 Park place, New York, announce an important trade sale of Enameled Ware on September 17, 18 and 19 at their warerooms. The sale is by order of Lalance & Grosjean Mfg. Company and National Enameling & Stamping Company, and will comprise over 12,-

000 cases of goods from the factories of these concerns. The goods will be sold by the case in quantities to suit the jobbing and retail trade.

JOSEPH HUSE & SON, 91 Blackstone street, Boston, Mass., are offering to the trade an attractive case of Mica, containing 2 pounds of the material in eight different sizes, viz.: 2 x 3, 3 x 5½, 1½ x 3, 3 x 6½, 4 x 5½, 2 x 5, 4½ x 4½, and 5 x 5 inches. This Mica is guaranteed strictly first-class goods.

Talk about "sending coal to Newcastle!" Here are two cargoes of Welsh anthracite coal, aggregating 8000 tons, on their way across the Atlantic bound for New York, to be used, so it is said, by the Manhattan Elevated Railway locomotives. Furthermore, the news comes from Philadelphia that the local Board of Education, having failed to get bids from the Pennsylvania coal companies for the furnishing of about 25,000 tons of anthracite for the public schools, have completed arrangements to import their supplies of hard coal from England at a cost of only \$1 a ton above the average rate heretofore paid for Pennsylvania anthracite. Who would have believed a year ago that we should be now bringing in that essentially American fuel—anthracite coal—from abroad? Such are the straits to which the miners' strike has reduced the Eastern hard coal consumers.

## Horan Stay Gutter Hanger

PATENTED.

A REVOLUTION  
IN GUTTER  
HANGING

Four Pounds of Solder and  
One Day's Labor Saved  
on Each Gross USED

CUT NO STAYS  
USE NO SOLDER  
USE NO THUMBOLTS  
USE NO RIVETS

SIZES : 3, 3½, 4, 4½, 5, 6, 7 inches, in Gross Packages  
" 8 and 10 inches, in Half Gross Packages

### The Horan's "Staying" Points:

It is the only perfect combined Stay and Hanger on the market. Its hinge movement enables adjustment at shop. Nothing to do at building but drive nail. Make joints in the bead of gutter with Hanger adjusted without catching under the eaves. Stay wire being adjustable it will hang single or double bead, octagon, O G., Box Gutter or any hanging eave trough. It is the easiest and most rapidly adjusted Hanger in the market and makes the neatest and most substantial job. It will carry more weight than any wire hanger without sagging or springing from the drain line, and is the equal in strength of the steel Hanger. Ask your dealer for it. If he can not supply you write us direct.

# The Pesky Pin Holes

are responsible for the majority of Roof Troubles.

Both pin holes and troubles are avoided when you use

## GUMMEY'S ANTI PIN HOLE GENUINE CHARCOAL IRON PLATES

They make a Perfect Roof.

IMPORTED AND SOLD ONLY BY

Gummey, McFarland & Co., - = Philadelphia.

## DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

**STEEL & IRON ALUMINUM COATING CO.,**  
CONNELLVILLE, PA.

A Few Interesting  
FACTS about  
OUR

Genuine CHARCOAL  
Tinned IRON  
SHEETS

These were introduced by us several years ago on account of the dissatisfaction caused by the Roofing Tins made on a body of Steel. We argued that such trouble was unknown fifty years ago when nothing but pure Charcoal Iron was used, and that the trade would willingly pay the difference in cost if they could again secure an old-fashioned Iron Plate and thereby ensure to their customers substantial long-lasting roofs. Whereupon we decided to import and sell such an IRON Plate as would stand the test of centuries. We did so and are now and have ever been the ONLY house in America selling a plate made on a base of PURE CHARCOAL IRON. For years we advertised and talked up the virtues of our IRON SHEETS, and now, when the trade has become alive to its merits and it is being demanded on all sides by architects, owners and builders, numerous spurious imitations have sprung up on all sides, falsely claiming to be the equal of our well-known Tin. We caution all our customers and all others who desire only the ORIGINAL TINNED IRON to correspond with us direct. All inquiries are welcome and will meet with immediate recognition and prompt reply.

How  
to  
Make  
the  
Best  
Roof

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

## M F Roofing Tin

is heavily coated with pure tin and new lead by the *most favored* old style process. The thorough amalgamation of the coating with the surface of the black plates, effected by this process, makes the plates impervious to rust or atmospheric gases. Ask your roofer—or send for a copy of the book.

## McFarland's Metal Worker's Protractor Pattern.

For Laying Out Pipe Elbows, Miters, and Similar Work in Sheet Metal.

In the accompanying illustration the lines drawn from center, cutting tangents to arcs, and corresponding perpendiculars through their divisions at an equal distance from base line, show the different positions of a pivoted blade on protractor pattern in laying out the  $\frac{3}{4}$  in. miter or half pattern for a square cornered 90° elbow. It is also shown that the arc of a  $\frac{3}{4}$  in. circle with its lines through division points is unnecessary to produce the pattern.

Protractor patterns for any required angle and diameter of pipe, of aluminum, \$5.00.

The same, printed on suitably heavy card board, \$1.25.

Model sent free with circulars.

# A PERFECT FOLDER for STOVE PIPE and CYLINDERS.

Niagara  
Adjustable Pipe Folder.

The old style Stove Pipe Folders (Wright's, &c.) can no be relied on to turn locks of even and uniform widths. The Folder herewith shown overcomes this difficulty entirely.

The Niagara Adjustable Pipe Folder is sure to produce a lock of uniform width the entire length, as variations in the hardness of the material have no influence whatever. It also possesses the advantage of having an adjustable gauge for locks from 3-16 to 3/8 inch wide. Length, 30 and 42 inches.

MADE BY

**Niagara Machine and Tool Works,**

No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.  
With Lever Arc, Automatic Gauge. Will cut No. 2 iron,  
97 inches long.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel 1/2 inch thick, cut off and mitre angle iron 1/2 inch thick, and do it perfectly.

WRITE FOR LOWER PRICES.

WE have been told by dealers that they have occasionally lost orders for Paragon Furnaces because some other furnace cost a little less. How foolish! Why, the Paragon is the cheapest furnace we ever heard of—it gives more heat to the square inch than any other furnace made. The slight advance in price is paid only once, but the Paragon keeps right on saving money for your customers year in and year out. Why don't you "get next" to the Paragon.

# ROUND OAK

## Standard of America

There's a coal bin  
in the cellar  
of a fine residence  
on one of the avenues  
on the south side  
in Chicago  
that contains today  
all ready for winter  
twenty-four tons  
of "egg" hard coal.  
This is the amount  
they have used  
every winter  
to keep about  
"three-quarters warm"—  
"some days  
in the winter  
they couldn't do that."

The old furnace  
has given up the struggle  
after but few years  
and we propose  
with the  
Round Oak air tight furnace  
and Round Oak methods  
to keep them wholly warm  
and use about  
one-half that coal.  
We would like to hear  
from furnace men  
who are genuinely enthusiastic  
about high class furnace work.

# Important Facts

FOR THE

## ...Dealer to Consider...

"GARLANDS" are used as the standard of comparison by Manufacturer, Merchant and Consumer.

"GARLAND" Stoves and Ranges have never been victims of the auctioneer's hammer, but always command ready sale.

They are made of the best material, by experienced workmen, and are guaranteed to be the very best goods of their kind that can be manufactured for the price asked, which is no more than that of equal grades.

"GARLAND" Stoves and Ranges are the best known, most extensively advertised, and therefore easiest to market.

THE DANGLER STOVE & MFG. CO., CLEVELAND, OHIO, U. S. A.

# MONARCH

## TRIPLEX No. 63 GAS HEATER.

AN ORIGINAL AND POWERFUL HEATER  
AND A STRIKING BEAUTY.

Has three 6-inch Russia Iron Radiator pipes within which are located smaller tubes, each flattened at the lower end, forming the back walls of the burners, as shown through the mica windows.

The heated air passes up and around these tubes, heating also the current of air within, which is taken from the floor, discharging it through the open work nickeled top, making a strong combination and a handsome heater.

The Monarch Stove & Mfg. Co.,  
MANSFIELD, OHIO.

## ARTISTIC ENAMELED STEEL RANGES

*The only Enameled Ranges on the market to-day.* Are not to be confused with the Black Japan and so-called baked enameled ranges which will burn off and rust. Our Enamel being fused with the iron is guaranteed rust and fire proof.

*The Highest Grade of materials* only are used in the construction of our ranges and our Enameling Process is the only successful one.

An ornament to the kitchen and a delight to the housekeeper because so easily kept BRIGHT and CLEAN by use of soap and water, doing away with the objectionable stove polish.

An attractive line and ready sellers. Send now for Illustrated Catalogue.

### The St. Louis Enameling Company,

S. E. Cor. Ninth and Monroe Streets, ST. LOUIS, MISSOURI.

We do enameling of specialties and our line of Enameled Steel Signs cannot be excelled.

## About Fire Pots.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

### The American Furnace Co.,

1911-13 PINE STREET,

ST. LOUIS, MO.

Burn Hard or Soft Coal or Coke. Large Doors.

Large Radiators, easy to clean out

Write for prices and secure the agency before the other fellow gets it.

## FRENCH FOLDING SCREENS FOR FIRE PLACES

We are the only manufacturers of this line in the United States.

*Send for Our Prices  
Before Importing.*

Our screens are heavier, smoother finished, and generally better than the imported article.

Finished in pure brass, gilt, lacquer and Berlin black.

Screens made in the following heights: 18, 20, 26 and 30 inches.

A large variety of styles.

Send for catalogue of  
**Fire Place Goods**  
made of brass, wrought iron and cast iron.

## FURNACES, RANGES AND STOVES

THOUSANDS IN USE 1000 IN A SINGLE CITY  
RECORD EVERYWHERE ESTABLISHED*References to Some of Our Furnaces, Now and Through  
Past 25 Years in Continuous Service*

COMET Heavy Steel Drum

Both furnaces are well made—all exposed parts heavy. *A generation or constant service establishes their record for durability, economy, powerful heating, easy to set, simple to operate.*

The radiator of the STAMFORD ALL CAST FURNACE is a combined dome-tubular and cylinder construction of immense capacity and heating power.

The COMET radiator is made of heavy cold rolled steel. Fire pot and exposed parts especially heavy and durable.

The COMET is made for satisfactory service and not for PRESENT cheapness, ENDING IN EARLY DESTRUCTION.

OUR GUARANTEE follows everything we make, whether stoves, ranges or furnaces, and is established by our over 70 years' record.

Also an elegant and new line of OAK STOVES

STAMFORD, CONN.

IF YOU ARE NOT SELLING THE

### Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,

**WINCHESTER  
HEATER.**

Scott said of Napoleon that no one could claim with better right to be a sovereign among soldiers. Without wishing to steal his powder, we might say the same of the "WINCHESTER" Heater. Its success lies in the fact that it accomplishes what it was built to do, viz: make heat. Smith & Thayer Company, Boston, Mass.; 105 Beekman St., New York.

## Prove Our Assertions

The force of an argument lies in its application. We argue all the time that

## **"GURNEY" HEATERS**

400 SERIES, DORIC and BRIGHT IDEA

are the best selling heaters in existence. And the fact is having constant application at the hands of our agents. Ask any one of them what kind of reception the Heater receives. Find out whether its extra long wear, its extreme economy in fuel consumption and the ease and simplicity of its operation influences its sale. Then when you've satisfied yourself as to the force of our argument, write for full particulars concerning an agency—for you certainly couldn't make a more profitable business connection.

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel. The general type of construction is exactly the same as the regular "DIGHTON" which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once.

The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the fire is thoroughly cleaned.

If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

PIPE BENDING CO**  
160 RIVER ST., NEW HAVEN, CONN.

## THE "BEST" LIGHT

is a portable, 100 candle power light, costing only 2cts per week. Makes and burns its own gas. Brighter than electricity or acetylene, and cheaper than kerosene. No Dirt. No Grease. No Odor. Over 100 styles. Lighted instantly with a match. Every lamp warranted.

Agents Wanted Everywhere.

**THE BEST LIGHT CO.,**  
207 E. 5th St., Canton, Ohio.

## Put Your Finger

Perpendicularly over the chimney of a lighted lamp and then across the top of the chimney and see which will burn your finger most.

## New Era Radiators

are placed directly over the heat current that passes up the center of a stove or furnace pipe. As a heat saver and distributor of hot air they are unapproached by any device ever invented. A practical test will convince both you and your customers.

Send for our inducements to handle these radiators now. The season is just approaching when you can sell large numbers of them.

**WILMOT CASTLE & CO., 76 Elm St., Rochester, N. Y.**

## MOTT'S UTILITY RADIATORS.

ONE MAN'S OPINION.

"Like them, why certainly I do. They please me in every way—lighten my work, lessen my expense, and win the approval of my patrons. Under the circumstances I think this is good policy, don't you?"

This steamfitter voices the opinion of many. Agencies granted to established firms if territory is uncovered. Write to-day for catalogue and full particulars.

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

## IS IT SO?

It is said that a tea-kettle will boil quickest on top of a chimney. However that may be, all agree that there is too much heat wasted there. Nothing but the cross tube **ROCHESTER RADIATOR** has ever trapped it. If you were to heat a poker, would you hold it at the side of the flame or over the top? Or would you cook food on the side of a cook-stove in preference to the top? It is thus with the **ROCHESTER RADIATOR**, which takes the heat from the top of the current and not from the side. The cross tubes cool the hot current, just as you would blow across a cup of tea to cool it, only there are from 96 to 120 such currents in operation.

4,866 sq. ins.

## ROCHESTER RADIATOR CO.,

100 Furnace St., ROCHESTER, N. Y.

**A** N IDEAL Wall Register (closed) may cost a little more than a hole in the floor. It may cost you a little less. **IT IS THE BEST** Uni-

versal Side Wall Register. Used on all widths of pipe and by live dealers to their advantage.

All Sizes and Finishes.  
Lowest Prices.  
Prompt Shipments.

First Floor Open, No. 9, 10 or 12.

IDEAL REGISTER CO. 129-131 West Woodbridge St., Detroit, Mich.

**A** TOMS of heat make degrees of temperature in a house. Every degree of temperature conserved by the utilization of heretofore wasted heat means added weight to the side of economy on the balance of expenses. The cause which produces these effects is the **COLUMBIA RADIATOR**.

A radiator which utilizes the most heat, which is neat and compact and which is so constructed as to be most easily cleaned, is sure to prove the quickest, readiest seller. We call your attention to the vertical system of tubes in the **COLUMBIA** which assures direct radiation, even distribution of heat and added facilities for ventilation, and which also assures the simplest, easiest method of cleaning.

We solicit your correspondence, knowing that offering you as we do a superior article at a price which places us in a class alone, when you place your order the **COLUMBIA** will command your attention. We do not offer an untried article, but one which has stood the test and proven itself a marketable product.

# Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnerns and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

## PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

**Chapter I.—Furnaces**—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

**Chapter II.—House Heating**—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

**Chapter III.—The Combination System**—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

**Chapter IV.—Air**—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

**Chapter V.—Heating and Ventilation of Buildings**—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

**Chapter VI.—Heating of Public Buildings Churches and Stores**—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

**Chapter VII.—Fan-Furnace Combination System**—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

**Chapter VIII.—Temperature Control.**

**Chapter IX.—Estimate and Contract Blanks.**

**Chapter X.—Value of Fuels.** The Proper Size for Furnace Chimneys—with tables.

## APPENDIX.

**Furnace Fittings**—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

SENT, POSTPAID, ON RECEIPT OF PRICE, \$1.50

A NEW AND ENLARGED EDITION.

## KITCHEN BOILER CONNECTIONS.

A SELECTION OF PRACTICAL LETTERS AND ARTICLES RELATING TO  
WATER BACKS AND RANGE BOILERS.

The attention of readers of THE METAL WORKER is directed to the *fifth and enlarged edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

|               |                                             |                  |                                                       |
|---------------|---------------------------------------------|------------------|-------------------------------------------------------|
| In Chapter I. | Kitchen Boiler Below Range.                 | In Chapter VIII. | Two Horizontal Boilers Connected with One Water Back. |
| " VI.         | Water Hammer in Boiler Connections.         | " IX.            | Supplying Hot Water in Large Buildings.               |
| " VII.        | Proper Connection for a Horizontal Boiler.  | " X.             | Lime Deposit.                                         |
| " VIII.       | Double Water Back Instead of Double Boiler. | " XII.           | Hot Water Supply and Heating a Barn.                  |

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

*It tells How to Connect Kitchen Boilers and Water Backs Under all Conditions.*

*It explains Remedies to apply to all kinds of Difficult Cases.*

*Heating from Kitchen Boilers is fully described.*

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

Denver, Seattle, San Francisco.

Sell a man a poor elbow and  
he will remember it as some-  
thing from your store that was  
not worth the money. Get a  
few cents more from him for  
the best elbow made and he  
will see the QUALITY and  
forget the price.

The "Perfect" Elbow is the  
best Elbow made. It will do  
you the most good.

## WHY

THE TRIUMPH ADJUSTABLE STOVE PIPES  
TAKE THE LEAD:

They are easy to put together.  
They are easy to take down.  
They can be nested for storage.  
They save freight.  
They need no wiring.  
They cannot telescope.  
They are the only safe stove pipe.  
They are what the people want.

**The Climax  
RATCHET STOCK**

Is an indispensable tool for  
conveniently threading iron  
pipe in ditches, under floors  
in corners, over head, etc.  
With this tool threads can be  
cut without removing whole  
lengths of pipe. This tool is  
provided with a strong vis-  
which securely grips the pipe  
and by means of the leading  
thread the die is forced on pipe  
and the thread is cut. It is  
made of malleable iron and  
steel, and while light in weight  
making it convenient to carry  
is very strong and rigid. The  
advantages of this tool make  
it absolutely indispensable to  
Plumbers, Steam and Gas Pipe  
Fitters, Gas and Water Com-  
panies, Machinists, etc. It  
takes standard size dies, which  
are extra if furnished.

No. 1 threads  $\frac{1}{4}$  to 1 in. pipe,  
takes 2 or  $2\frac{1}{2}$  in. die, \$10.00.  
No. 2 threads 1 to 2 in. pipe,  
takes  $2\frac{1}{2}$ , 3 and 4 in. die, \$17.00.  
For sale by leading jobbers.

ESTIMATE  
BOOKS**For Plumbers and  
Heating Men

*Your Contract and Estimate Record Book  
for Plumbers is one of the best books that ever  
came into our house and we would not be with-  
out it for three times the amount it cost. We  
can figure without omitting anything with ac-  
curacy at a very short time. We think that  
every plumber should not be without this valu-  
able book.*

W. C. BENNETT &amp; CO., Haverhill, Mass.

*We have used an estimate book for three years  
and could not do without one. Would say that  
yours is far superior to any yet used and can  
cheerfully recommend it.*

W. R. PARK &amp; SON, Taunton, Mass.

*A great advantage. Prevents the leaving out  
of small items, which amount to more than the  
cost of the book in a very short time.*

CHAS. W. COOMBS, Lawrence, Mass.

*Your Contract and Estimate Record Book  
has been of great use to me in both the saving of  
money and labor, and I would highly recom-  
mend it to any or all master plumbers.*

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many,  
and indicate both that a well arranged  
estimate book, which provides complete  
lists of items to be figured upon, is a  
time, labor and money saver, and that the  
"CONTRACT AND ESTIMATE  
RECORD BOOKS" come up to this  
requirement.

THE EDITIONS ARE AS FOLLOWS:

**CONTRACT AND ESTIMATE  
RECORD BOOK FOR PLUMBERS****OFFICE EDITION.**

200 Pages. Arranged for 100 Estimates.  
Size 8 x 11 inches. Cloth bound, \$1.50  
500 Pages. Arranged for 250 Estimates.  
Size 8 x 11 inches. Cloth bound, \$2.50

**POCKET EDITION.**

200 Pages. Arranged for 50 Estimates.  
Size  $3\frac{1}{2}$  x 8 in. (oblong). Flexible cloth  
binding, \$0.50

**CONTRACT AND ESTIMATE  
RECORD BOOK FOR STEAM AND  
HOT WATER HEATING**

200 Pages. Arranged for 100 Estimates.  
7 x 12 inches. Cloth bound, \$1.50

**NOTE.** The omission of one item in an es-  
timate on a plumbing or heating job might  
result in the loss of all profit. These  
books provide a reliable, accurate, business-  
like record, and a sure means of avoiding  
loss due to mistakes and omissions.

Sent prepaid on receipt of price.

# Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ Inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. Hot water circulation and hot water supply in buildings are treated at considerable length.

## PART OF CONTENTS:

### DANGEROUS BLUNDERS IN PLUMBING.

Running Vent-Pipe in Improper Places—Connecting Soil-Pipes with Chimney-Flues—By-Passes in Trap-Ventilation, etc.

▲ Case of Reckless Botching.  
▲ Stupid Multiplication of Traps.  
▲ Trap Made Useless by Improper Adjustment of Inlet and Outlet Pipes.

Unreliability of Heated Flue as a Substitute for Proper Trapping.  
Need of Plans in Doing Plumbing-Work.

### HOUSE-DRAINAGE.

City and Country House-Drainage—Removal of Ground-Water from Houses—Trap-Ventilation—Fresh-Air Inlets—Drain-Ventilation by Heated Flues—Laying of Stoneware Drains.

Requirements for the Drainage of Every House.

Ground-Water Drainage of a Country House.

Ground-Water Drainage of a City House.

Fresh-Air Inlets.  
The Location of Fresh-Air Inlets in Cities.

Air-Inlets on Drains.  
The Proper Way to Lay Stoneware Drains.

The Tightness of Tile-Drains.

Danger of Soil-Pipe Terminals Freezing unless Ends are without Hoods or Cows.

Objection to Connecting Bath-Waste with Water-Closet Trap.

How to Adjust the Inlets and Outlets of Traps.

How to Protect Trap when Soil-Pipe is used as a Leader.

Size of Ventilating-Pipes for Traps.

How to Prevent Condensation Filling Vent-Pipes.

How to Prevent Accidental Discharge into Trap Vent-Pipe.

Why Traps should be Vented.

### MISCELLANEOUS.

Syphoning Water through a Bath-Supply.

Emptying a Trap by Capillary Attraction.

As to Safety of Stop-Cocks on Hot Water Pipes.

How to Burnish Wiped Joints.

Admission to the New York Trade Schools.

Irregular Water Supply.

Hot Water from the Cold Faucet, and how to Prevent it.

Disposal of Bath and Basin Waste Water.

To Prevent Corrosion of Tank Lining.

Number of Water Closets Required in a Factory.

Size of Basin Wastes and Outlets.

Tar Coated Water Pipe Affect Taste of Water.

How to Heat a Bathing-Pool.

Objections to Galvanized Sheet Iron Soil-Pipe.

To Prevent Rust in a Suction Pipe.

Automatic Shut-Off for Gas Pumping Engines, when Tank is Full.

Paint to Protect Tank Linings.

Size of Water-Pipes in a House.

How to Make Rust Joints.

Covering for Water-Pipes.

Size of Soil-Pipe for an ordinary City House.

Where to Place Burners to Ventilate Flues by Gas Jets.

How to Prevent Water Hammer.

Why a Hydraulic Ram does not Work.

Proper Size of Water-Closet Outlets.

Is a Cement Floor Impervious to Air?

Two Traps to a Water Closet Objectionable.

Connecting Bath-Wastes to Water-Closet Traps.

Objections to Leaching Cesspool and Need of Fresh Air Inlet.

The Theory of the Action of Field's Syphon.

How to Disinfect a Cesspool.

Slabs for Pantry Sinks—Wood vs. Marble.

Test for Well Pollution.

Corrosion of Lead Lining.

Size of Flush Tank to Deal with Sewage of a Small Hospital.

Details of the Construction of a House-Tank.

The Construction of a Cistern under a House.

To Protect Lead Lining of a Tank, and Cause of Sweating.

Stains on Marble.

Lightning Strikes Soil-Pipes.

How to Fit Sheet Lead in a Large Tank.

Why Water is "Milky" When First Drawn.

Carving-Tables.

Is Galvanized Pipe Dangerous for Soft Spring Water?

How to Arrange Hush Pipes in Cisterns to Prevent Syphoning Water Through Ball Cock.

Depth of Foundations to Prevent Dampness of Site.

Self-Acting Water Closets.

Wind Disturbing Seal of Trap.

How to Draw Water from a Deep Well.

Cause of Smell of Well Water.

Absorption of Light by Gas Globes.

Fitting Basins to Marble Slabs.

Intermediate Tanks for the Water Supply of High Buildings.

How to Construct a Filtering Cistern.

Objections to Running Ventilating Pipe into Chimney-Flue.

Size of Water Supply Pipe for Dwelling House.

Faulty Plan of a Cesspool.

Disposing of Refrigerator Wastes.

Pumping Air from Water Closet into Tea Kettle as Result of Direct Supply to Water Closets.

Danger in Connecting Tank Overflows with Soil-Pipes.

Arrangement of Safe Wastes.

What is Reasonable Plumbers' Profit?

### HOT WATER CIRCULATION IN BUILDINGS.

### HOT WATER SUPPLY IN VARIOUS BUILDINGS.

# Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 Inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

### BOILERS.

On blowing off and filling boilers.  
Where a test-gauge should be applied to a boiler.

Domes on boilers; whether they are necessary or not.

Expansion of water in boilers.

Cast vs. wrought iron for nozzles and magazines of house-heating boilers.

Pipe-connections to boilers.

Passing boiler-pipes through walls; how to prevent breakage by settlement.

Heating-boilers. (A problem.)

Isolating-valve for steam-main of boilers.

On the effect of oil in boilers.

Proportions for rivets for boiler-plates.

Iron rivets and steel boiler-plates.

Is there any danger in using water continuously in boilers?

A supposed case of charring wood by steam-pipes.

Domestic boilers warmed by steam.

### VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.

Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.

Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.

Calculating the amount of radiating-surface for a given room.

How much heating-surface will a steam-pipe of given size supply?

Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.

Computing the cost of steam for warming.

### RADIATORS AND HEATERS.

Improper position of radiator-valves.

Hot-water radiator for private houses.

Remedying air-binding of box-coils.

How to use a stove as a hot water heater.

"Plane" vs. "Plain" as a term as applied to outside surface of radiators.

Relative value of pipe on cast-iron heating surface.

Relative value of pipe on steam-coils.

Warming churches (plan of placing a coil in each pew).

Warming churches.

### PIPE AND FITTING.

Steam-heating work—good and indifferent.

Piping adjacent buildings: pumps vs. steam-traps.

True diameters and weights of standard pipes.

Expansion of pipes of various metals.

Expansion of steam-pipes.

Advantages claimed for overhead piping.

Position of valves on steam-riser connection.

Cause of noise in steam-pipes.

One-pipe system of steam-heating.

Air-binding in return steam-pipes.

How to heat several adjacent buildings with a single apparatus.

Air-binding in return steam-pipes, and methods to overcome it.

### VENTILATION.

Size of registers to heat certain rooms.

Determining the size of hot-air flues.

Window ventilation.

Removing vapor from dye-house.

Calculating sizes of flues and registers.

On methods of removing air from between ceiling and roof of a church.

### STEAM.

Economy of using exhaust steam for heating.

Heat of steam for different conditions.

Superheating steam by the use of coils.

Effect of using a small pipe for exhaust steam-heating.

Explosion of a steam-table.

### CUTTING NIPPLES AND BENDING PIPES.

### RAISING WATER AUTOMATICALLY.

### MOISTURE ON WALLS, ETC.

### MISCELLANEOUS.

Heating water in large tanks.

Heating water for large institutions and high city buildings.

Questions relating to water-tanks.

On heating several buildings from one source.

Coal-tar coating for water-pipe.

Filters for feeding house boilers.

Other means of clarifying water.

Testing gas-pipes for leaks, and making pipe-joints.

Differential rams for testing fittings and valves.

Percentage of ashes in coal.

Automatic pump-governor.

Cast-iron safe for steam-radiators.

Preventing fall of spray from steam-exhaust pipes.

Heating and ventilation of a prison.

Amount of heat due to condensation of water.

Expansion-joints.

Resetting of house-heating boilers—a possible saving of fuel.

How to find the water-line of boilers and position of try-cocks.

### MISCELLANEOUS QUESTIONS.

Applying traps to gravity steam-apparatus.

Connecting steam and return risers at their tops.

Power used in running hydraulic elevators.

On melting snow in the streets by steam.

Arrangement of steam-coils for heating oil-stills.

Converting a steam-apparatus into a hot-water apparatus and back again.

Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

## Soft Coal for Heaters.

Owing to the scarcity of hard coal through the miners' strike many who have no knowledge of the peculiarities of soft coal will this winter be called upon to use some one of the various grades of bituminous coal in the furnace or boiler. The dealers are already being cross questioned not only by their customers but by many who happen to pass their shops as to whether soft coal can be satisfactorily used in their heating apparatus or as to the cost of making the necessary change so that soft coal can be used. In another column a correspondent presents a series of pertinent questions with special reference to the apparatus he has been selling, and undoubtedly many others will be interested in the information that may be elicited on each point raised. These questions afford an opportunity for those who are in a soft coal section to render substantial assistance to their brethren in hard coal districts by describing in detail what they find is necessary in their every day practice. No great effort will be needed to give information that will aid an immense number of their fellow countrymen, for it is only necessary to describe fully and simply what they have been doing for years in a matter with which they are thoroughly familiar. We hope that the tender of our columns for the presentation of such information and instruction will be accepted and that *The Metal Worker* may have another opportunity to prove its value as a medium for communication on subjects of vital interest to tradesmen in different sections. The present condition of the fuel question in the East would seem to afford an opportunity for those manufacturers who for years have been making heating apparatus specially adapted for soft coal burning to bring to the attention of Eastern buyers the goods that have proved satisfactory in the home of soft coals of all kinds. The Eastern manufacturer has gone West with his plant to extend his trade and the present peculiar situation may afford to the Western manufacturer the opportunity to come East with his soft coal goods and possibly repeat the success of the invasion of the East by the oak stove.

## Plumbers' Combination.

It has become quite fashionable of late among newspapers in various parts of the country to give voice to charges that association plumbers are combining for the oppression of some of their *confrères* in the trade. Through the master plumbers' associations a considerable proportion of the trade are organized and united for the purpose of securing the protection of their interests, which is undoubtedly a legitimate action. That in some instances the temptation to use this combined

influence in a manner that has been disagreeable to those who have felt it is probably true. But it is doubtful if the power has been used for this purpose to any greater extent in this than in other branches of trade. Investigation of the cause of the outcry which has been taken up by the newspapers will almost invariably lead to the conclusion that the work done by the master plumbers in various sections has not resulted otherwise than for the public good. The boards of health throughout the country are old institutions, and they were doing an excellent work before the plumbing trade assumed the importance that it now enjoys. There can be no doubt, however, that the plumbers at the present time are not only sustaining the efforts of these boards to preserve the public health, but have brought sanitary work to a higher perfection than would have been possible without their assistance. The best plumbing regulations that have ever been produced by the boards of healths have been due directly to the master plumbers' associations, and these regulations have been widely adopted. The regulations, however, were found insufficient to secure the desired object, and the plumbing inspector has been the outcome. Where the plumbing inspector has held to the strict enforcement of the regulations no hardship has come to those master plumbers who are thoroughly masters of the business, and who make a practice of doing the best work they know how. Plumbers in all parts of the country who take out a license to work under such regulations have been constantly annoyed by incompetent and unlicensed plumbers working in competition with them. Wherever a master plumbers' association takes steps to remove these demoralizing factors from the field the cry of oppression is raised. These offenders, however, are entitled to no sympathy. Their work is in many instances a menace to the health of the occupants of a building, and it is generally worth much less than is paid for it. Moreover, the bids made by these incompetent men have the effect of making the general public dissatisfied with the reasonable charges of competent men for good work done in compliance with the regulations. While the methods sometimes adopted to get rid of these offenders are rather drastic, and, viewed apart from the surrounding conditions, may seem to the uninformed a hardship to the plumbers who complain, the object should not be lost sight of. This object is the same as one of the first principles of our government, "the greatest good of the greatest number," consequently the method of accomplishing it should receive commendation rather than censure.

## Oil Fuel.

The high price and growing shortage of hard coal, caused by the prolonged strike in the Pennsylvania anthracite regions, are directing increased attention to the oil fields of the country as presenting a probable solution of the fuel problem should the famine point in anthracite be approached. Crude oil is being successfully used for fuel purposes in the place of coal in many directions. It is employed in locomotives and for the generation of steam in stationary boilers, while a steam vessel has recently made a trip across the Pacific Ocean, using oil as fuel. In view of these facts it is not strange that the public should be eagerly investigating the adaptability of oil as a domestic fuel in place

of the expensive and scarce anthracite. Inventors in many parts of the country are busily engaged in the effort to develop oil burning apparatus that can be used effectively and economically with hot air furnaces, house heating boilers and domestic heaters, as well as in kitchen stoves and ranges. A number of devices of this character have lately appeared on the market, and it is likely that this winter will see a wide experimental use of oil as a domestic fuel in the East, where the anthracite shortage is most keenly felt, as well as in the districts adjacent to the various oil fields. The fact that oil can be produced much more cheaply than coal, combined with its greater convenience and economy of handling, together with the absence of the ash and dirt inseparable from the use of coal, either hard or soft, tells heavily with the public in favor of oil and stimulates the desire to obtain appliances for using the liquid fuel for household purposes. Undoubtedly means will be found before long to make such a substitution generally possible.

The future of oil in this country seems to be very bright. The area of oil production is steadily expanding. Each week we read of the discovery and development of new oil wells in widely scattered sections, so that it begins to look as though the oil area of the United States was fully as large as the coal area, great as the latter is. The cost of producing oil once a well is struck is far less than that of mining an equivalent amount of coal, and with the provision of effective and economical apparatus for burning it oil should be a cheaper fuel by any standard of comparison. The economic importance of these facts can hardly be exaggerated. That oil in the future will be a successful competitor of coal for practically all purposes in which the solid fuel is now employed seems to be a foregone conclusion.

### Central Plants for Public Buildings.

A work that eventually will prove a substantial benefit to the general public is being done by the heating engineers throughout the country, in the recommendation of the use of a central heating plant wherever municipal and county buildings are so located in a city that substantial economy can be effected thereby. The authorities at Binghamton, N. Y., are considering the erection of a central heating and lighting plant for both the city and county buildings, these buildings being so located that a considerable advantage would be gained by locating in one building all the boilers and the machinery needed for producing the heat and light for supplying the different buildings grouped around it. A combination heating and lighting plant makes an economical system, particularly where but one set of employees is required to take charge of such a plant for both the city and county buildings, as it insures a saving on the payroll. Moreover, the plan will undoubtedly effect a saving in fuel. The matter of determining the proportionate expense which two different bodies should bear is one that can readily be calculated by the engineers, and should not be an obstacle to securing the economy which such a central heating and lighting station would insure. Another advantage that should not be overlooked is the isolation in a separate building of all the noise, dust, and dirt producing apparatus, so that the other buildings are free from such annoyance. This is not a new proposition, but it seems to be receiving more general consideration, which affords evidence that the heating engineer is an accepted authority in his special field. Wherever progress and economy in cost of plant, labor, fuel and maintenance go hand in hand those who guide the movement are public benefactors.

### The American School of Correspondence.

No doubt there are many young men, as well as older men already in business, who are glad to have the opportunity of taking up technical studies at home with the assistance of an educational institution, especially if their work would count toward a degree when followed by a year or two of study at a resident school. This opportunity is about to be offered by the American School of Correspondence, heretofore located at Boston, Mass. The management of the school announce that they have made arrangements with the Armour Institute of Technology for the American School of Correspondence to be located in future on the Armour Institute premises in Chicago. Furthermore, a considerable number of the faculty of the Armour Institute will become actively associated in the instruction of the students of the American School. Dr. Gunsaulus, president of the Armour Institute, who is the chairman of the Advisory Board of the American School of Correspondence, is described as enthusiastic over the educational possibilities of the work, and it is at his invitation that the change has been made. President Gunsaulus believes that the American School system offers a means of bringing college influence to the masses such as no other form of education has ever offered. In fact, it is university extension work in every sense of the word.

Those young men who are too poor to give up four years to obtain a training and degree at a resident school can now considerably shorten their resident work by correspondence instruction, as the examination of the pupils of the correspondence school will count toward a degree at the Armour Institute. They will also be admitted to classes there on the subjects on which they have passed by correspondence. Furthermore, the management of the school will make a systematic effort to assist its students to procure positions in Chicago or vicinity, thereby enabling them to attend the excellent night schools at the Armour Institute, where all the advantages of laboratory and practical shop work are provided.

The American School of Correspondence will in no way lose its identity by the change of location. It remains a separate institution under its own management, but with the full co-operation and help of the president and faculty of the Armour Institute of Technology. In making this change the management state that they intend to use every effort to raise the standard of correspondence instruction to such a degree of excellence that their examination credits will be accepted by other schools besides the Armour Institute. They purpose to make their diploma stand for thorough work in the eyes of manufacturers and people employing trained technical help.

Last week's conflagration at the Spindle Top oil field, in the Beaumont district of Texas, suggests a possible very serious danger. It is reported that the fire was caused by carelessness, a man having gone into a tank of oil with a lighted lamp, which caused an explosion, the blazing oil spreading over a tract of 10 acres, burning derricks and tanks and igniting the oil in the latter, with the result of serious loss. More than once the Baku oil fields of Southern Russia have been the scene of violent conflagrations, with great destruction of life and property. It is to be hoped, therefore, that precautions will be taken in the Beaumont and other oil fields to provide so far as possible against the occurrence of any such catastrophe in this country.

At a recent session of the Trades Union Congress in London a resolution favoring the establishment of a Government arbitration court in Great Britain was rejected by a three to one majority. Many of the delegates opposed the resolution on the ground that under such a system of compulsory arbitration as was proposed the unions would not only lose many of the advantages they had wrung from their employers, but would die of inanition, since the need of their survival would no longer exist.

## STOVE PRICES ADVANCE IN NEW YORK MARKET.

For some time the feeling has been strengthening among the stove manufacturers marketing their product in New York that the prices ruling were too low, notwithstanding the independent advances made by different houses. This feeling prompted correspondence which led to a call for a meeting of the manufacturers interested, which was held at the Astor House, New York, on Thursday afternoon. The meeting was a comparatively short one, as the discussion developed a unanimous opinion that all stoves should be advanced in price. This idea was finally presented in a motion to advance the prices of all stoves 5 per cent., to take effect at once, which was unanimously agreed to.

The manufacturers are to be congratulated upon their action, which is undoubtedly justifiable under the prevailing conditions. It is doubtful if it will cause any trouble to the dealers, who should accept the advance as a notice to mark up their stock in hand accordingly. So far, the trade this year has been of large proportions, and if all concerned derive some increase in profit from the action taken the business of the year will have a more satisfactory outcome.

## THE CAHOONE ANTI-SMOKE STOVES.

The Pittsburgh Stove & Range Company, Pittsburgh, Pa., have recently begun the manufacture of stoves and ranges for burning soft coal under the Cahoon patent. The method of construction secures perfect combustion of the fuel, thus preventing the emission of smoke. In appearance these stoves and ranges resemble those of almost any standard line, their exterior furnishing no evidence of their peculiar merits, but the ingenious construction of the fire boxes makes them differ decidedly from all others heretofore placed on the market. In the words of an experienced stove man who has thoroughly tested these stoves, "the whole fire box of the range is hot blast and grate surface," with not a dead inch of space anywhere, even in the top, all gas generated being consumed. The heating stove is of the coal air tight type, round in shape, and is a self feeder. The claim is made that it will generate as much heat from 2 tons of bituminous coal as is usually obtained from 3 tons of anthracite. Great economy in fuel is thus secured, which is due to the utilization of all the gases in producing heat.

The following statement relative to the adaptation of the Cahoon stove to the use of lignite has been given us: "Last week one of these ranges was placed in the hands of a man to fire with lignite. He had never before seen the range, nor even a piece of lignite, and he was given no instructions. The results which he produced cannot be equaled with anthracite coal or any other solid fuel in any other fuel box. There was no smoke, no odor, no soot and no waste. It was a perfect fire."

Demonstrations of the special features of these stoves are now being given throughout the Northwest, and the orders being taken are regarded by the Pittsburgh Stove & Range Company as proving that the claims of the inventor are based on genuine merit.

## Death of Henry A. Richardson.

Henry A. Richardson, the founder of the Richardson & Boynton Company of New York and Chicago, died at his residence, Poughkeepsie, N. Y., on Monday, September 16, in the eighty-fourth year of his age. Mr. Richardson had taken no active interest in the affairs of the concern for a number of years, but had lived the quiet and peaceful life of a country gentleman. His particular delight was in horses and to his outdoor life with them and early good habits is due the vigorous health he enjoyed up to within a week of his death. Mr. Richardson and the late N. A. Boynton were shopmates and

practical men, and they became partners before 1850 in the business which was the nucleus of the present concern, which is still so prominent in the trade. The firm were formerly located on Broadway when that thoroughfare seemed to demand such a business. Afterward they removed to Canal street and finally to Water street, where the business increased to its present important proportions.

Mr. Richardson was highly esteemed by all his employees and friends, both in business and social circles, for his many good qualities and particularly for his affection for his old employees. He leaves a widow and three sons, Henry T., Dwight S. and A. P. Richardson. The funeral services were held at his residence on Wednesday and the interment was at Greenwood.

## Death of Otis H. Burtis.

Otis H. Burtis, one of the best known business men of Troy, N. Y., who for many years was prominently identified with the stove industry in that city, died from heart trouble on September 10 at his residence, 36 Ferry street, Troy. Mr. Burtis had not been in the best of health for some time, but the news of his death came as a shock to his large circle of friends. Mr. Burtis was one of the pioneers of the Troy stove industry. When that city was the center of the business he acted for many years as the chief traveling salesman for the old firm of Swett, Quinby & Perry. Later he entered into partnership in the stove making business with Herbert R. Mann. Subsequently Mr. Mann retired and Mr. Burtis associated with himself his son, H. L. Burtis, under the firm name of Burtis & Co. With this concern he was connected up to the time of his death. Mr. Burtis was of a kindly nature and made many friends. He was also an energetic, upright and well informed business man. He was born in Salem 58 years ago and had resided in Troy about 30 years. Mr. Burtis is survived by a widow, two daughters and two sons. He was a member of the Masonic order and also an Odd Fellow.

## The Channon-Emery Stove Company.

The annual stove catalogue and price-list which has just been issued by the Channon-Emery Stove Company, Quincy, Ill., is a neatly printed volume of 164 pages bound in muslin paper covers with side title consisting of a *fac-simile* of the company's trade-mark. The volume, which is known as catalogue No. 30, presents in great variety the leading lines of Never Fail stoves, ranges and heaters which the company manufacture. The place of honor is given to the steel range bearing the name Never Fail, which is intended for using soft coal, hard coal or wood as a fuel. It embodies the latest features of construction, is ornamented in an attractive manner and is offered both as a four-hole and six-hole range and in the usual modifications. Following this is the Crown Never Fail steel range, an entirely new construction, up to date in all respects. The Advance Never Fail is another new pattern which the company have brought out, embodying features of construction and ornamentation which cannot fail to command the attention of the wide awake dealer. A steel range which is intended for using wood exclusively is offered under the name of Kitchen Never Fail.

Among the cook stoves are found various lines offered under the same names as those which apply to the ranges already mentioned. In the way of all cast goods there is the usual assortment, some of the patterns being new for this season. The list includes a long line of cooks intended for burning wood exclusively. These goods occupy the bulk of the catalogue, the remaining portion being given up to the presentation of heaters, the Cheerful Oak being first considered. This is the company's leading stove in this line and is offered in an attractive dress in which nickel plays a prominent part. Other goods include the Cheerful Hot Blast, the Woodbine, a line of Cheerful air tights, the Rival, a neat box stove, together with an assortment of globe, cannou and laundry stoves. The catalogue concludes with a list of hollow ware and an alphabetically arranged index.

### Michigan Stove Company's Labor Day Display.

We present herewith a picture of the display made in the Labor Day parade at Detroit, Mich., on September 1 by the Michigan Stove Company. This display formed a part of the eighth division of the parade, under the leadership of Marshal John Shea, which was made up of floats prepared by the different business concerns of the city. The float of the Michigan Stove Company was conceded to be one of the most effective in the parade. It was drawn by four horses, and upon the vehicle, which was brightly ornamented with flags and bore on its top the well-known Garland trade-mark of the concern, were members of Iron Molders' Union No. 31, who with a small furnace showed how the Garland stoves and ranges are made. But instead of stoves, the product of the furnace on this occasion consisted of a quantity of medals, on which were inscribed "Labor Day 1902, Michigan Stove Works." These medals were distributed to the crowd. The wheels of the vehicle were

Anthracite or hard coal is so called for a good reason. It is more solid, more compact than bituminous. The latter is loose. It absorbs air and water. The flame from anthracite coal is from 2 to 3 inches long—that of soft coal is several inches longer. We know that the flame is the visible union of the carbon and oxygen, and that the products of the combustion of the gases generated go along up the flue.

In the case of the big soft coal flame, that also carries with it the soot and carbon besides the gases. Consequently plenty of room is necessary. Soft coal won't burn satisfactorily in a deep pit, which is the feature of our stoves here. It requires a large shallow fire, and the stoves used out West are built especially to meet these requirements. Besides, our stoves all have small fire boxes, while large, shallow fire boxes, large flues and shallow pits are the distinguishing features of the soft coal stoves.

If the New York housewife starts in to use soft coal it will simply mean discomfort and misery from the very start. Small rooms will be choked up with smoke, and nothing in the house will remain clean. She will have to feed her fire oftener, and the work of cleaning out the flues and range will be something awful. Nor

Michigan Stove Company's Labor Day Display.

hidden by a covering on which were the words, "Molders of Garland Stoves and Ranges."

### Hard Coal Stoves Not Adapted for Soft Coal.

The possibility of the coal strike extending into the autumn months, or even into the winter, and sending the retail price of anthracite up to such an exorbitant figure as to prohibit its use for household purpose by people in moderate or straightened circumstances, has turned the attention of many to the possibility of using soft coal in its stead. At the first glance those who have not considered the subject thoroughly are apt to take the position of a wholesale coal dealer who stated offhand that he did not see why bituminous coal should not answer all purposes, as the people out West, who could not get anthracite, had been using soft coal for years with satisfaction. While it would create more smoke, and a family might have to put up with certain inconveniences from its use, they would not, in his opinion, have to suffer from the cold, and they could also count on cooking their meals.

The New York stove men do not, however, take this favorable view of the situation, and in the issue of the *Evening Post* of a few days ago R. H. Horne of the J. L. Mott Iron Works gave his view of it in this way:

There would be no reason in the world—except the existence of the Health Board and the city ordinances that soft coal smoke is a nuisance—why New York's householders should not burn soft coal at home as they do in the West if it were not that the stoves in use here are not soft coal stoves.

can this cleaning be neglected, for a lapse will mean that the range will refuse to work and the fire go out.

As stove manufacturers we know the trouble that is experienced now to keep flues clean, as the neglectful housewife invariably blames first the landlord and then the stove for her own failure to occasionally clean out the soot. What this nuisance would amount to if soft coal were used in our stoves generally we cannot predict. The flues would get choked up with soot continually, every spot, every crevice, every ornament and curtain in the house would be black and dirty, and the soot and smoke would even penetrate to the exterior of the house.

In the country the damage to frame structures would be something awful to contemplate, and I think I am safe in saying that the house in which soft coal was used this winter would urgently call for entire repainting and redecorating inside and out in the spring, at a cost probably more than double the amount involved in the difference between the cost of the winter's supply of hard and soft coal.

It is a fact that soft coal will throw out as much heat as anthracite, perhaps more, but heat is not everything. Comfort and cleanliness are also likely to figure in the ordinary household. As for the matter of expense it should be remembered that much of the smoke of soft coal is carbon, and this is all wasted, so that it will take more soft coal to accomplish certain purposes than if hard coal had been employed. In other words, you would find that while you were able to heat your house nicely with 10 tons of hard coal last year it would probably take 15 tons of bituminous to do it this year. Of course, there are patented devices for consuming this soft coal smoke, but they can only be used in big manufacturing plants. Their application to ordinary household stoves and ranges has been very limited, and they are in but few instances in use.

## TRIBULATIONS OF FURNACEMEN.

BY CALORIC RAYS.

I am often asked the stereotyped question, "What kind of a heating system would you put in your house?" Well, that depends. If my house was going to be as big as the Waldorf-Astoria I should favor steam, but if an ordinary knockabout eight or ten room house I would have hot air—that is, a furnace system. But, my dear sir, if I were so fortunate as to even contemplate a new house I would not have a Cheap John tinker put it in. That furnace, and all that was linked, soldered, cemented and hung to it to make it complete, would be in proper proportions with all pertaining thereto and according to law and safety.

The trouble, my friend, is that the average man will take his plans, hire himself to some contractor and get his bid on the whole blooming business. After he gets it a bright idea, but an old one in the world, strikes him, and he takes those plans to another contractor and gets his bid, hinting at the same time that he must get down to a certain figure if he wants to get the job. And so he goes the rounds until the whole gamut is run and he finally or invariably takes the, by this time, much be-thumbed and blurred plans to the first bidder and to him he says: "See here, Mr. Tenpenny, I want you to build this house, but you're too high by \$399. If you lop off, say, \$398 the job's yours. What yer say, eh?"

### SKIN WORK.

Well, the \$398 are lopped off. But there is a reddish gleam in the builder's eye. He can skin the job, and skin every subcontractor under him. And "let's see; the job calls for furnace heat. No style, no make, no size; simply furnace heat. All right." Then the contractor sallies forth on a skinning tour. The mason, the painter, the plumber are visited and, finally, the Cheap John tinker; the man that gets more furnace work than all the others in town combined—of course, not on account of merit or reliability or reputation. This Cheap John tinker either doesn't know as much about furnace work as a clam does about performing on a trapeze, or he knows as much about it as any of them. But he is in it for the dollars, and as the majority of the people are looking for bargain counter prices in furnace work he has seared his conscience and hardened his heart and he gives the man what he wants—a cheap job.

He has become a "bucker," and can afford to buck any "son of a gun" in town on furnace prices. He gets the job; he skins it, flays it and lets the owner do the scorching—scorching the casings, scorching the galvanizing off the smoke pipe, charring the beams in the cellar trying to keep warm. He burns out the 18-inch pot in two weeks' time in trying to do the work of a 26-inch pot, and all for the want of a little fresh air, trying to force enough air through a 10-inch cold air pipe to fill four 7-inch, three 8-inch and four 9-inch pipes. The whole job was put in on the same merits that sold the Scotchman's razor, "'Twas made to sell, not to use."

### APPEARANCES DECEPTIVE.

True, the job when new looked nice to the inexperienced eye; uice, bright tin pipes. Of course some joints were gaping for additional air, while at the augles some of the pipes did bag at the knees. And the cold air pipe, "Why, bless your soul, it's the same as your neighbor has got." (That heats four rooms.) Then the registers. They all have the same sized grin on their faces. The 7 x 6 x 9½ foot bathroom 7 x 10 inch register smiles at the 8 x 10 inch register in the 14 x 15 x 9½ foot sitting room and the 8 x 10 inch register in the 12 x 14 x 9½ foot reception hall for not doing their duty. They get all the cussing and spitting at, while he is hugged and praised for being so faithful and up to snuff and right over the furnace.

The owner goes to John Tinker: "See here," says he, "I can't heat my house; what ails your furnace anyway?" John Tinker looks at him with a pitying smile, "What's up now?" "Why," exclaims the owner, "I can't get any heat to my sitting room or hall. I've burnt 4 tons of coal in six weeks, but no heat." "Is that so?" from Tinker. "Well, I'll send a man around to-morrow and fix it."

### INVESTIGATION AND THE RESULT.

The man is sent down. After lighting his pipe and surveying the job that some other journeyman put up for the same John Tinker, he soliloquizes, "A bum job." He goes back and hands in his time card, "Three hours. Repairing furnace at 40 Easy street for Mr. Cheerup." There is a suit. The owner sues. John Tinker, on the stand, testifies that there was nothing specified, only to put in a furnace job. And he did so. John Tinker wins the suit in addition to the three hours' time for repairing. The owner cusses the whole blooming business. At the suggestion of his neighbors he has the whole thing ripped out and pays \$675 for a hot water job.

### STARTING OUT WRONG.

Now, who is to blame, take it all in all? Why, in the majority of cases, the public—the owner. The owner has plans made for a house that would, if carried out to the letter, cost between \$6000 and \$7000; whereas in his own mind he chuckles at the prospect of getting a \$6000 house for \$4000. He has a conniption fit when he goes to a reliable contractor, who sublets only to reliable contractors, and gets his first knockout blow in the building business. Of course the plans are sent around the circuit and pass through clean and through dirty hands. They are looked over by honest eyes and by dishonest eyes. They are figured with an ordinary every day pencil and they are figured with a pencil so hard and sharp that the figures appear shrunken and ashamed of themselves. The low contractor, the cheap contractor, the man who, perchance, has failed time and time again and been discharged on a basis of assets so small that a keg of six-penny nails would not be the equivalent. Or it's the mau that has skipped from Maine to California, from the lakes to the gulf. He is a new man in town. He cuts a big swath, and in a little while, in the still night, vanishes to parts unknown, leaving the whole blooming shooting match, including our friend John Tinker, in the mud.

Then the owner in his wrath rises up and suggests some changes in the plumbing and the furnace heating, which call for extras, which he reluctantly pays for. The final scene: Total cost of house, \$8500, and nothing like or as good as the plans and specifications called for.

### MISERY FROM MISMANAGEMENT.

Another experience is like this: "Say, what kind of a furnace do you call that that your customer put in for me? Why, I can't get any higher than 55 degrees if I was to shovel coal all day. Run down to my house if it's cold to-morrow and see what ails it, will yer?" I go down. It's a cold day. The mistress is in. With a \$2 horse blanket over her shoulders and a scowl on her face she leans over the register trying to get warm. At the same time she is rocking a baby, who is buried up in the baby carriage. The temperature is 45 degrees. Whew! I meander down to the cellar, saying nothing but sawing wood. I look at the fire. I poke it gently and lo! it collapses into a dead faint. I go over to the cold air inlet. It is shut tighter than a fresh oyster with the lockjaw. I go about gently making the necessary changes. After doing so in the cellar, I meander over the house, opening all the registers. Down to the cellar again I go, find an old box, sit down, pull out a two for a fiver, light it and smoke; look over *The Metal Worker* and let things simmer. After a while I hear stirring around upstairs. I hear a lullaby song. I put on a little more coal; sit down again; then trot upstairs. Presto, change! The \$2 blanket has vanished, the scowl on the mistress' face has disappeared, while the little fat baby's legs are high in the air that now registers 75 degrees. A surprise to the lady of the house and a gratification to the baby.

After a few minutes' scientific lecturing on the principles of hot air heating, I leave with the blessing of the house, never to be troubled again by them, if they possess common sense enough to run the furnace as it should be run and keep a good fire, with good coal.

THE SUN STOVE COMPANY, Detroit, Mich., are erecting a building 30 x 70 feet as an addition to their plant, in order to accommodate the increasing demand for their products.

### The Orient Gas Stove.

We present in the accompanying illustration a general view of one of the attractive patterns of gas stoves which has recently been added to their already extensive assortment by the Reineke-Wilson Company, Pittsburgh, Pa. The stove is known as the Orient, and is constructed of cast iron and sheet metal. It has large radiating and heating surfaces consisting of an outer shell and an inner heating drum. In operation the air passes into the inner heating drum through a number of inlet registers and is discharged at the top of the

*General View of the Orient Gas Stove.*

stove through the outlet registers. The inner drum is directly over the fire and the air passing through it is rapidly heated. The products of combustion pass between the inner heating drum and the outer shell to a flue collar of ample size. The stove is fitted with cast iron fuel basket, cast iron drilled burners and nickel valves and mixers. A noticeable feature of the stove is the ample mica door and the nickel plated trimmings. The outer shell of the stove is made of planished iron with ornamental stamped steel top.

### Superior Warm Air Furnaces and Utica Heaters.

We have received from the Utica Heater Company, Utica, N. Y., a copy of their new furnace catalogue, consisting of 40 pages of letterpress, profusely illustrated and bound in paper covers. In offering this publication to the trade the manufacturers call special attention to the features embodied in the construction of their entire line, and state that during the past year they have brought out several new patterns of heaters particularly adapted to all climates and fuels. The company have had 25 years' experience in the manufacture and sale of heating apparatus, and claim to be in a position to meet every requirement of the trade in their particular line.

A valuable feature of the opening pages of the catalogue are short chapters on furnaces, heating and ventilation which the dealer will find well worthy of perusal.

Among the patterns which are presented special attention is called to the New Superior furnace, designed and constructed to meet the demand for a heavy all cast iron furnace for using hard or soft coal or coke. In its construction has been embodied the latest and most improved features that are to be found in the Superior line. The gas burning chamber is high above the fire and a complete combustion of the gases is claimed to take place before they pass into the return flue radiator. The fire pot is extra heavy and cup joints are used in connecting all parts of the furnace, thus avoiding the use of bolts and providing for expansion and contraction.

Another heater to which the company draw special attention is the Superior dome furnace, made with double feed doors. This has been brought out to meet the demands of customers in sections where wood is largely used as a fuel, particularly during the fall and spring months, or even during the entire season, and where a strong and powerful heating surface is required. The furnace is made in three sizes and is intended for burning hard or soft coal, coke or wood. Among the closing pages of the catalogue instructions for setting furnaces in brick are given, accompanied by a foundation plan showing the position of the brick piers, a description of the company's new revolving duplex grate, some information about hot air pipes and illustrations of the Imperial and Keystone steam and hot water boilers.

### Vulcan Gas Appliances for Heating.

The Willam M. Crane Company, with office at 1131-1133 Broadway, New York, have issued the fall edition of their catalogue No. 22, illustrating in an attractive style their leading specialties in the Vulcan and Manhattan lines. The leading place is given to the New Vulcan, a sanitary heater, made in two sizes for natural or artificial gas. The appearance is attractive and the construction is such that all products of combustion are utilized to the fullest extent. Following this are the Omega odorless sanitary blue flame gas stove; the Vulcan cylinder and perforated heaters; the Vulcan radiators, shown in great variety; asbestos and reflector gas heaters, a handsome line of Manhattan gas heaters for open fire places, the Vulcan gas fires, the Vulcan log fires, gas logs, andirons, waffle stoves and miscellaneous goods of interest in this connection. The catalogue concludes with a description of the Vulcan gas furnace, which is so made that it can be automatically controlled.

### ODD PLATES

THE GREAT WESTERN STOVE COMPANY, Leavenworth, Kan., are increasing their manufacturing facilities by the erection of a five-story brick warehouse, estimated to cost \$30,000. It will be located at 910 to 912 Harney street, in the city named.

THE latest Colebrook novelty in advertising that is being sent through the mails by W. H. Colebrook Sons & Co., Syracuse, N. Y., takes the form of a card having attached to it a little pair of scissors with the legend, "Cut it Out." The lines underneath explain this advice as referring to cutting out all other kinds of Stove Putty and Furnace Cement except Colebrook's.

A NEAT pamphlet which is being sent out by the Peninsular Stove Company, Detroit, Mich., calls attention to some of the leading points of the Oak Peninsular Hot Blast Smoke Consumer, which is intended for using any kind of coal or wood. The Stove is of handsome exterior and is offered in a number of sizes. Its special features include steel base, treble jointed corrugated fire pot, which is said to increase the durability and heating surface of the Stove, deep reflector ring, air tight ash pit door, capacious ash pan and portable magazine for hard coal. The Duplex grate and shaking ring can be withdrawn when desired without removing a single plate or bolt.

THE plant of the Rome Stove Works, owned by Bowie & Terhune, at Rome, Ga., was destroyed by fire on the night of September 6. The fire started about 7 o'clock in the evening, and before it was thoroughly under con-

trol extensive damage had been done. The loss is placed at about \$45,000 and the insurance at about \$35,000.

THE PHILADELPHIA STOVE & IRON FOUNDRY COMPANY of Philadelphia, Pa., have been absorbed by the Philadelphia Stove Company, recently incorporated. Howard H. Dickey is president of the new company and Robert W. Trump general manager.

WE have received from the Fuller & Warren Company, Troy, N. Y., a copy of an attractive pamphlet relating to the P. P. Stewart line of Ranges which they manufacture in great variety. The printing is in old gold and black upon a good quality of paper and the binding is in colored covers of appropriate design. A short obituary with portrait of P. P. Stewart is found on the first page, following which are interesting comments regarding the goods shown. In speaking of the P. P. Stewart the manufacturers state that it is their aim to produce a Cooking Stove from which the most excellent and satisfactory results may invariably be obtained with the least expenditure of fuel; at the same time grace and beauty are not sacrificed to utility. The P. P. Stewart is offered in a great variety of styles and sizes and embodies features which have established for it an enviable reputation in the trade. Particular attention is called to the removable nickel work of the Stove which affords the opportunity for thoroughly polishing the parts by rendering them easy to handle. The band is also removable and is firmly held in position by means of a thumb screw. Broken views of the Range show the more important features of construction in a way to render them easily understood by the dealer and user.

BRIDGEFORD & Co., Incorporated, Louisville, Ky., are greatly rushed in their Steel Range department. They find a scarcity of skilled workmen in this line and could possibly give employment to a few hands.

BERGSTROM BROS. & Co., Neenah, Wis., have recently issued a new price-list covering the Royal line of Steel and Cast Ranges, Cook Stoves and Heaters. It is sent out in the form of a four-page folder and gives such information relative to the Stoves in question as the dealer is likely to find convenient and useful.

A PACKAGE of trade literature which is being sent out by the Graff Furnace Company, 208 Water street, New York, presents much interesting information relative to their various lines of specialties. Among the matter is a neat catalogue and price-list of the Faultless and Columbian Ranges, made in both portable form and for brick setting. The Faultless is provided with extra large single oven, and it is also made with double oven in order to meet specific requirements. Some of the styles are fitted with vertical circular boilers and others are provided with the horizontal boiler. The company also make Combination Ranges for gas and coal, which have established for themselves an enviable reputation in the trade. They are particularly serviceable in flat houses where space is always at a premium. Under the name Hero the maker offers an attractive Range which is thoroughly up to date in all respects. The Elegant Elevated Oven Range and the Elegant Fire Plate Heater are also illustrated and described. Other specialties referred to include the Comfort Furnace, built according to the most improved ideas; the Hot Blast and Tubular Cast Iron Furnace; the Oregon, made both in portable form and for brick setting; the Hero Steam and Hot Water Boilers, and the Rival Furnace, made in four sizes in portable form and in two sizes for brick work.

THE STANTON HEATER COMPANY, Martins Ferry, Ohio, are making the "radiating" or "crown" sheet of their Stanton Heater of the best quality of fire box steel several times as thick as is ordinarily employed for steel radiators in warm air furnaces. The construction is such that expansion and contraction are said to have no effect on any joint, neither does the fire come in contact with any joint or seam in the entire construction.

THE MONARCH STOVE & MFG. COMPANY, Mansfield, Ohio, refer to the Monarch Triplex No. 63 Gas Heater as a powerful construction of original design. It has

three 6-inch Russia iron radiator pipes, within which are located smaller tubes, each flattened at the lower end, forming the back walls of the burners. The heated air passes up and around these tubes, heating also the current of air within, which is taken from the floor, and discharging it through the open work at the top.

THE BELLEVILLE STOVE WORKS, Belleville, Ill., are making a very extensive line of Malleable Ranges and Steel Ranges, both with single and double oven. They are also offering a great variety of Cast Cook Stoves, Ranges and Heaters, the merits of which are strikingly set forth in a new catalogue which they have just issued. Special reference is made to the Splendid St. Clair Steel Cook Stove, the Incandescent St. Clair Oak and the Incandescent St. Clair Air Tight Heater.

THE Model Ruby four-hole Cook Stove, which is being offered by the Home Stove Company of Indianapolis, Ind., is made both with steel and cast ovens. While intended for using coal or wood as a fuel, the company also make it for burning wood exclusively according to circumstances. It is of neat exterior, cast ornamentation being largely used in its decoration. The oven is perfectly square, measuring in one size 18 x 20 x 13 and in the other 20 x 22 x 13. The Stove is one of the latest additions to the company's assortment and the manufacturers expect it will meet with a hearty reception.

### Examinations for Ironmongers' Clerks in England.

Our London correspondent reports that the Ironmongers' Federated Association of the United Kingdom are preparing a system whereby ironmongery clerks can pass an examination and obtain a certificate. The idea has progressed so far that a proposed syllabus has already been evolved. The syllabus, in full, is as follows. The numbers preceded by an asterisk will be considered optional subjects:

- 1.—Standards of Weights and Measures and their usual divisions.
- \*2.—Standards of Metric Weights and Measures and their usual divisions.
- 3.—Gauges in common use for Wire and Tube.
- 4.—Calculation of Areas.
- \*5.—Calculation of Cubic Capacities.
- \*6.—The Physical Characteristics of Metals and Alloys. Definition of ductility, malleability, elasticity and tensile strength.
- \*7.—Oxidization or Rusting. The particular properties of Iron (wrought, malleable, cast and steel), Copper, Tin, Lead, Zinc, Gun Metal, Phosphor Bronze, Pewter, Brass, Nickel Silver, Britannia Metal and Aluminum.
- 8.—Methods of Preserving from Oxidization.—Painting, lacquering, bronzing, plating, tinning and galvanizing.
- 9.—Hardening and Tempering of Metals.
- 10.—Methods of Joining Metals. Welding, brazing, soldering and riveting.
- \*11.—Relative Electrical Conductivity of Metals.
- \*12.—Gas Fitting. Sizes of pipes for installation of a given number of lights. Choice of metals for special situations.
- \*13.—Sanitary Plumbing. Forms of traps, closets and lavatory basins. Sizes of waste pipes. Joints used, for lead and iron pipes in sanitary work.
- 14.—Domestic Hot Water Supply.
- \*14a.—Heating by Hot Water. High and low pressure.
- 15.—Locks. The general principles of construction and various kinds in common use of Locks, Lock Furniture and Hinges.
- \*16.—Bells—Electrical and Crank. The principles of the telephone and speaking tube.
- 17.—Builders' Black and Brass Foundry. Knowledge of usual stock articles. The candidate will be required to draw out specifications and make sketches.
- 18.—Nails, Locks, Bolts and Nuts, Screws and Rivets, various kinds and their common uses.
- \*19.—Tools, trade classification as Sheffield list; and Cutlery, pocket and table.
- 20.—Hollow Ware. Cast, wrought, stamped, enameled, tinned and galvanized.
- \*21.—Scales, Weights, Spring Balances. The requirements of the Weights and Measures Acts.
- \*22.—Wire and Wire Goods.
- \*23.—Rain Water Goods. Pipes, Gutters and Fittings.
- \*24.—Kitchen Ranges.
- \*25.—Stove Grates.
- \*26.—Planning Glazed and Unglazed Tiles.
- \*27.—Agricultural Implements. Plows, Harrows, Drills, Mowers, Reapers, &c.
- 28.—Steam, Gas and Water Tubes and Fittings.
- 29.—Making Drawings and Instructions for Workshop.

- 80.—Handwriting, Orthography and Calculation of Discounts; also Bookkeeping.  
 \*31.—Lamps. Structure, materials and appliances for safety of petroleum Lamps; Colza and other heavy oil Lamps.  
 32.—Woodturnery. Builders' and house furnishing.  
 \*33.—Colliery and Mill Furnishing.  
 34.—Ship Chandlery.

Examinations will be held every six months in the principal centers, viz.: Birmingham, Bristol, London, Manchester and Newcastle. The examination committee may decline to hold an examination if less than ten applications are received by the secretary. Ninety per cent. of total possible marks entitle the candidate to a first-class certificate with honors; 75 per cent. of total possible marks to a first-class certificate; 50 per cent. to a second-class pass. There are other regulations, but these are the chief.

### The Dandy Ice Pick.

The Franklin Specialty Company, 627 to 631 Franklin street, Reading, Pa., are manufacturing and have just placed on the market the Dandy ice pick illustrated herewith. This ice pick is nickel plated all over, and the handle is of polished hickory. The length of the tool is 11 inches and it weighs only 8 ounces. The pick is

*The Dandy Ice Pick.*

said to be remarkably adapted to its purpose, besides being of attractive appearance.

### The Grimm Sap Spout.

G. H. Grimm & Co., Rutland, Vt., have placed on the market the sap spout shown in the accompanying illustration. It is made from one piece of No. 21 gauge steel. The tinning is the last operation so that the raw edges are covered with pure block tin, besides being a guarantee against rust. The holes opposite each other at the large end are for inserting a nail to form a handle, by means of which the spout is slightly turned and thus is readily removed from the tree. The hole at the

*The Grimm Sap Spout.*

bottom of the small end is for draining the sap from the bore so as to prevent the formation of ice and the accumulation of sour sap in the bore. The spout will fit  $\frac{3}{8}$ -inch,  $\frac{7}{16}$ -inch and a  $\frac{1}{2}$ -inch hole. By reaming a  $\frac{3}{8}$  bore to  $\frac{7}{16}$  inch, and a  $\frac{7}{16}$  bore to  $\frac{1}{2}$  inch at proper intervals during the sugar season one fourth more sap, it is claimed, will be obtained; also that with the use of this spout removing of the bark from the tree is not required. The spouts are furnished with and without hooks.

### The Improved Henis Broiler.

The Royal Mfg. Company, 408 Commerce street, Philadelphia, Pa., are offering the improved broiler shown herewith. It is made of heavy sheet steel, having deep circular grooves in both sides of the broiler to

retain the juices of the meat. The perforations are punched and upset so as to make it impossible for the juice to escape, and the meat, held firmly, is cooked in its own juice. It is explained that the nutritious juices are retained and conveyed back to the meats, in the self-basting process, by simply reversing the broiler a few

*The Improved Henis Broiler.*

times while broiling. The broiler is made in sizes Nos. 8 and 9 to fit the stove hole, and in use, it is explained, there is an absence of smoke and no soiling of stove or range.

### Frame for Holding Twine.

In the store of Valentine Weidig, Unionville, Conn., is the little wooden frame shown in the accompany-

ing illustration. There are three holes in each side and through each set of holes is passed a 3-16-inch iron rod, one end of which is bent in the form of a handle. These rods are run through and support the balls of twine, as illustrated. To the handle on each

*Frame for Holding Twine.*

rod is fastened a tag, giving price of the twine on that rod. The frame is hung where it can be readily seen by means of the screw eye shown on the top.

H. M. CLINE & SON are a new firm who have gone into the retail Stove, Hardware and Tinware business at North Topeka, Kan.

## WATER CLOSET FLOOR SLABS.

BY HELMAR.

Some residences, and nearly all public buildings, of whatever character, have tile, cement or mosaic floors in the toilet rooms. These floors need nothing better to set the closets on, but the majority of residences have wood floors throughout, usually soft wood, and a wood floor of any kind is not good to set a closet over. Hence the use of floor slabs. Yellow pine, known as "hard pine" in the Northern and New England States, is even

Water Closet Floor Slabs.—Fig. 1.—Plain Thin Slab on Floor.

worse than white pine, on account of its inability to withstand dampness without rotting.

In Fig. 1 is shown a section of a type of slab called a floor slab by the "scrimp" element. It is square edged, plain faced,  $\frac{7}{8}$  inch thick, set dry, rocks over one or two points like a five-leg table with the middle leg on a hump, and its dimensions are—too small. On cheap contract work the writer has seen the slabs all sizes, from just the size of the closet flange to 18 x 24 inches.

The purpose of a floor slab is not merely that the closet be "set on marble." The idea is to have the closet over a non-absorbing surface that will catch and hold accidental dripping, leakage, &c., and which can be sponged clean, with no injury to it or the surroundings. A small slab will not catch drippings or slight leakage effectively, whether plain or countersunk. If small and set back it raises the closet uncomfortably high. If set forward it does not reach the wall behind and the front edge is just far enough forward to make a stumbling place for the feet. If the

Fig. 2.—Countersunk Slab Placed on Floor.

closet room is to contain no marble except the floor slab the right way is to have it reach the wall behind, before shoe sham is put down, and extend far enough forward to make good foot room; and unless the room is very large it should go to the wall at both sides of the closet.

All slabs should be countersunk all around, leaving a boss the shape of the base of the closet to be used, except about 1 inch larger for a margin. A drip pipe from a residence floor slab is of but little consequence. It will not have the chance to take care of any considerable leak, and the room is cleaned so regularly that a small leak is discovered through the water in the countersink before it does much damage. When a drip pipe is put in it should discharge into the outer air or with open end over a sink or in basement, covered by

a gravity flap to keep air from circulating freely through it.

In Fig. 2 is represented a slab set on the regular floor. It is countersunk  $\frac{1}{4}$  inch, is  $1\frac{1}{2}$  inches thick and has a chamfered front edge. It is flat on the bottom side. Every projection above the level on the floor covered by the slab was removed before setting the slab. A ring of creamy cement or plaster around near the edge of the slab and a few bars across and along the floor, about  $\frac{1}{8}$  inch deep, are sufficient bedding. The floor should be well dampened where the cement is placed to keep the cement from setting too quick, and the slab settled into place by jostling and pressing down. No screws are necessary to hold the slab in place. If the slab sets against a plaster or cement wall it should be flushed full and smooth around the edges with cement for a cement wall or plaster of paris for a plastered wall. If the room has a wood baseboard set in a shoe the slab should reach flush with the face of the base, which will require cutting off the shoe front. A strip to match the shoe front should be fitted all around the wall edge of the slab and properly membered with the shoe. The slab should never extend less than 12 inches forward from a line drawn down from the front of the flush rim.

Fig. 3.—Countersunk Thick Slab Sunk to Floor Level.

A slab similar to the one in Fig. 2 is shown in Fig. 3. It is sunk so that the countersink is level with the top of the floor and the front edge chamfered down nearly to the floor level. If the house has no deafening floor it is best to cleat the joists and lay a floor low enough to receive the slab and a good bedding of cement, as shown in the sketch. If there is deafening it is only necessary to cut out enough of it to admit the slab and a bedding for it. In any case a strip should be put in to fill from the deafening or subfloor to the regular floor a little back under the regular floor line, to retain the bedding and make a good joint under where the slab joins the regular floor. The floor board which joins the slab along the front should be perfectly straight along the edge and without either groove or tongue, as shown. Slabs should never be less than  $1\frac{1}{2}$  inches thick, and if larger than 3 x 3 feet should be more— $1\frac{3}{4}$  or 2 inches, according to size.

It is scarcely necessary to say that slabs should be set level. When slabs are sunk in the floor the writer leaves the depth of the countersink above the floor level. They are apt to settle slightly and the floor may not be perfectly level to start with. The slab being a little high provides for these deficiencies.

W. H. SELVEY, president of the Selvey-Wyckoff Company of Springfield, Mass., died on September 11 at the Mercy Hospital in that city after a week's illness. Mr. Selvey had been connected with the plumbing business in Springfield for 23 years. He was born in Boston in 1862, and learned the plumber's trade in the employ of the Phillips Mfg. Company, rising to the position of superintendent of the steam fitting department. When the Phillips Mfg. Company were merged into the Selvey-Wyckoff Company Mr. Selvey was made president. Under his management the business has grown so that 50 men are employed. Mr. Selvey was prominent in social life in the city, and was a member of several clubs. He lived with his mother and sister, who survive him.

## The Range Boiler and Water Front.

BY M. L. KAISER.

With probably no other plumbing fixtures are natural laws so often abused and even totally disregarded as in the setting and connecting of the range boiler and water front. These fixtures may be properly set in several ways, but the wrong ways for setting them seem to be without number. Then, too, in some cases where the connections have been properly made originally, wear or deterioration, or some outside influences have produced a condition of things which should be remedied. The plumber should consider it a duty to warn the householder of the insecurity of an arrangement which to him is manifestly unsafe, and his reputation for honesty should be proof against the imputation that he is merely "hunting for work." The number of water front explosions—some of which have proved fatal, and almost all of which have done damage by fire or water—is a sufficient text from which to preach several sermons. Men and women will work day after day beside a boiler which rumbles and rattles so as to shake the house, when they would stay no longer than necessary in the vicinity of a steam power boiler when the steam is escaping from the safety valve at 80 pounds. Some of these domestic boilers and water fronts are under as great, or even greater, pressure, but the absence of a pressure gauge exemplifies the old saw, "Out of sight out of mind."

The term "boiler" is used throughout the present paper to mean the cylindrical storage tank of from 30 to 120 gallons capacity which is ordinarily seen connected with the domestic range. The word "water front" is used to designate the cast iron box, or wrought iron coil which heats the water in the boiler. What we call a boiler is, in English practice, called a storage tank, while the water front is the boiler. It will be seen that the English use of the two words is the more nearly correct, although, as a matter of fact, it is not desirable that the water should boil in either of the two fixtures.

### THE CONSTRUCTION OF WATER FRONTS.

One would think, considering the widely different conditions and varying pressures under which range water fronts are placed, that manufacturers of such goods would produce several patterns to meet those conditions. The reverse seems to be almost universally true, however. An excellent and heavy range was put on the market some years ago by a New York firm, about a dozen of which were placed among my customers the first year they were introduced. After being in use a short time several of the water fronts split, apparently without cause. Complaint to the home office brought the reply that they had never had any trouble with them, and that a large number of them had been in successful use for three years. They were probably all right for New York and vicinity, where the pressure from the house tanks is constant and comparatively light, but for a pressure varying from 50 to 75 pounds they were too weak. After replacing a round half dozen of the water fronts the manufacturers had a pattern made, smaller and heavier. However, it is not my purpose to find fault with the manufacturers of ranges, but to point out, if possible, some improvements which may be made by the plumber himself and give some hints which may be useful in overcoming difficulties often met with.

### CAUSES OF SCANT HOT WATER SUPPLY.

The complaint is sometimes made that "the range fails to heat the water." This may mean one of several things, or several things combined, and the plumber should take the trouble to ascertain: 1. Is the boiler too large for the water front, thereby furnishing large quantities of warm water, but no hot water except when water is drawn from the boiler only at long intervals? 2. Is the boiler exceptionally high in proportion to its diameter? 3. Is the range kept in constant use, or are short intervals of active firing succeeded by long intervals of severe checking? 4. Is the circulation good,

and are the circulation pipes properly arranged and graded? 5. Has the water front worked away from the side of the range, allowing cold draft of air to pass up between it and the range side, and is the checking done at the smoke outlet or at a check draft slide directly over the water front? 6. Did the present trouble originate at the time of the installation of a new boiler or of a new range, or at any definite time?

It matters greatly of course as to the amount of hot water used by the household, but it may as well be taken for granted that there will be no diminution in the amount of hot water used, and it is useless to advise or to expect it. A careful diagnosis of the case, as above outlined, will aid materially in prescribing for it, and in applying the proper remedy.

### BOILER TOO LARGE AND WATER FRONT CAPACITY.

In the case of condition No. 1, a boiler too large for the water front, the obvious remedy is to remove the large boiler and replace it with a smaller one. This is sometimes impossible, and an effective compromise may often be substituted. The reason that the abundance of warm water never gets really hot is that it takes a longer time than is allowed for the whole bulk of the water to pass through the water front; and while the water passing into the boiler through the upper, or flow, pipe is quite hot enough, it becomes cooled in passing upward through the mass of water in the boiler without appreciably raising the temperature of the whole body of the water. In general it is good practice to connect a 30-gallon boiler to a water front having an area of 75 square inches exposed to the fire; a 40-gallon boiler to a water front of 80 to 100 square inches area, and a 50 to 60 gallon boiler to a water front exposing an area of from 100 to 120 square inches area. These figures are mere averages, however, and may vary greatly under different conditions of firing and different makes of ranges. Indeed, it frequently happens that the tenants moving from a house have had considerable trouble with the range and water front, while the family succeeding them have had no trouble whatever.

### THE BENEFIT OF TOP CONNECTIONS AND SPECIAL WATER FRONTS.

If the flow pipe is disconnected from the side of the boiler and extended upward to connect to the hot water

The Range Boiler and Water Front.—Fig. 1.—Top Connection for Quick Heating.

distributing pipe at the top of the boiler, the hot water will flow from the water front to the top of the boiler direct, without passing through the whole body of comparatively cool water. A layer of hot water of varying depth is thus held in reserve in the top of the boiler, to be drawn off as needed. Care must be taken that the hot water service pipe is extended higher than the flow pipe connection, so that the circulation cannot be impeded by the collection of air. This method of connection, shown in Fig. 1, also answers well for overcoming

conditions Nos. 2 and 3, and for connecting a boiler to a gas range, or to a gas water heater, either permanently or for the hot season. Where it is desired to connect a gas range for summer use only in kitchens where the ordinary coal range must be used occasionally, the branches and plugs may be left in the hot water service pipe at the top of the boiler and in the return pipe near the range, and the gas range may be connected and removed with ease, neither range interfering with the operation of the other. Another method of overcoming conditions Nos. 1 and 3—and the better method, if the expense can be borne—is to order from the range manufacturers a special water front to extend across the rear end of the fire box in addition to the side, thus forming an L shaped box or water front, as shown in Fig. 2,

Fig. 2.—Special Water Front of Increased Heating Capacity.

with the connections in the usual place. This has been done in several cases with marked success.

#### POOR CIRCULATION FROM BAD PIPING.

As hinted in Condition No. 4, defective circulation may be one of the causes of the failure of the range to heat the water properly, and is sufficient of itself to cause the whole of the trouble. This condition may be due to the corroding and filling of the water front or of the circulating pipes with rust or sediment, to the faulty grading of the pipes, or to the number and abruptness of the angles. It scarcely need be said that the connecting pipes should be as direct and have as much grade as possible, and yet many ranges are connected with apparently no regard whatever for those considerations. Many ranges are now connected to the boiler with iron or brass pipe, with standard tees and ells, the radius of which is very short. To add to the retarding effect of these abrupt changes in direction the cut ends of the pipes are usually left with a very pronounced burr on the inside, made by the cutters. These burrs should be carefully removed with a reamer of the proper size. When a few elbows and some extra piping may be saved by omitting to parallel one pipe to the other, as

Fig. 3.—Connected to Avoid Friction.

shown in Fig. 3, it should be done, even at the expense of a less sightly job as the result. The beauty of a thing lies in its utility, anyway. At one time many cyclists ridiculed the pneumatic tire bicycle, with its enormous rims, while to-day no one would consider for a moment a solid tire bicycle.

#### STOPPAGE FROM CORROSION AND BURRS.

Usually, circulating pipes of galvanized iron are permitted to corrode and retard the circulation until a leak appears. When such is the case a thorough examina-

tion should be made of those parts which are still sound, and if at all corroded new pipe should be put in throughout, as it is very seldom that the old pipes will stand the strain of taking apart and putting together again. In renewing old range connections—and in placing the original connections as well—the pipes should never be less in diameter than the tapping of the water front, and in the case of unusually long and tortuous connections should be one size larger than the tapping of the water front.

The bore of the pipe should be preserved full size throughout, as water will pass through the pipe no faster than it can pass through its most constricted point. The ordinary brass boiler couplings are not suitable for water front connections, except for small ranges and boilers. They are almost invariably smaller inside than the pipe for which they are threaded, and the interior surface is quite rough. The same may be said of the ordinary brass boiler Y, which is often used for connecting one boiler to two ranges. Although threaded for 1-inch pipe on all three ends, the interior bore is not more than  $\frac{3}{4}$  inch, and is often less. Until a special fitting of proper proportions is made for such work the ordinary 1-inch pipe fittings are much better. If threaded malleable unions are used in the connections a pattern should be chosen which is large of bore at the washer ring in the center and not contracted, as shown in Fig. 4, or the washer ring may be cut away

Fig. 4.—A Character of Union to Avoid.

entirely if reasonably stiff washers are used. Red fiber washers are probably the most durable packing for malleable unions with flat seats. For the screw joints of the range connections white lead ground in oil is preferred by many plumbers. If the boiler is large for the water front and the size of the water front would seem to justify it, benefit may often be obtained by removing it and having it tapped one size larger and increasing the size of the connections correspondingly.

#### OTHER CAUSES OF TROUBLE.

Condition No. 5 hints at causes outside of the water front, the boiler, or the connections. The water front may have been jostled out of place somewhat by strain-

Fig. 5.—Displaced Tube Causes Trouble.

ing the pipes in making the connections, or it may have been worked out gradually from other causes. When the water front is set in place, and before the connections are made, it should be firmly wedged against the opposite side of the fire box until the connections are completed. Fire clay or furnace cement should then be plastered along the top against the side of the range to prevent the draft of air from passing up alongside of it, thus cooling it and injuring the draft of the fire at

Fig. 6.—A Temporary Repair.

the same time. In some of the portable ranges check draft doors and slides are located directly over the water front, as shown in Fig. 3, with the result that the air passes directly over it if the slide is much used. Suitable check drafts placed in the smoke pipe near the range collar will obviate trouble from this source.

Another cause of insufficient hot water is the absence of the inside extension of the cold water supply, which enters at the top of the boiler by means of a delivery tube. This may have been left out by accident or neglect, or may have corroded off and dropped down inside of the boiler, as shown in Fig. 5. The cold water mixing with the hot water will temper it to lukewarmness, and if much water is drawn from the boiler a short circuit is likely to occur, the cold water entering and passing across the top of the boiler and out by way of the hot water service pipe.

#### MAKING REPAIRS.

Condition No. 6 implies that definite information may be given as to the cause of the ineffective working of the boiler or range, information which the householder is seldom able to give. In case the cause is known, however, it is a comparatively easy matter to apply the remedy. It may be well to mention at this point that it often happens that the range connections spring a leak at precisely the time when the range can least be spared. A temporary repair may be made by means of a clamp made of strap iron or heavy sheet metal fastened around the pipe with a stove bolt, with a piece of sheet gum under the clamp and over the hole, as shown in Fig. 6. It sometimes happens that the tapping of the boiler connections is larger than standard originally, or has corroded so as to make it difficult to make a tight joint at these points. Miner's cotton soaked in red lead and wrapped around the threaded end of the pipe is often efficacious in securing a good joint. It is often possible to make the thread on the end of the pipe longer than usual and run a lock nut back to the shoulder before screwing in the pipe. When the pipe is screwed into the boiler a sufficient distance miner's cotton or cotton string and red lead may be wrapped around the pipe thread against the

Fig. 7.—A Jam Nut Connection.

boiler, and the lock nut screwed back against the cotton, as shown in Fig. 7.

#### CAUSES OF NOISE.

Notwithstanding that many householders become so accustomed to the rattling of the boiler that no attention is paid to it, it frequently happens that complaints of that nature are made, and it is "up to" the plumber to find and remove the cause. At the start care should be taken to see that the cause of the noise is at the boiler or the water front, and not the result of the vibration of some loose piece in the faucets or pipes. The noises may be caused by, 1, partial stoppage of the boiler supply pipe; 2, partial stoppage of house service pipe; 3, air pocket in the water front; 4, blister on inside of the water front casting; 5, partially clogged range connection; 6, pipes pitching in the wrong direction.

A frequent cause of the rumbling noise in boilers is a restriction or partial stoppage of the cold supply to the boiler, usually at the tube extending down inside of the boiler. It often happens that the water in the boiler, which may be under a pressure of 50 pounds per square inch, is at a temperature considerably above 212 degrees. On opening the hot water faucet hot water will flow from the boiler and the small stream of cold water flowing in to take its place is insufficient to maintain the pressure in the boiler, allowing steam to form in bubbles, which are at once condensed on contact with the cooler water. This will continue until the whole

body of water in the boiler is reduced in temperature below the point where steam will form under the pressure then in the boiler. When the hot faucet is closed the rumbling will cease at once, as the pressure will quickly rise to a point where steam cannot form unless the temperature of the water is raised still higher.

#### SMALL SUPPLY CONNECTIONS.

In this connection it may be well to call attention to the practice of inserting in the boiler inside supplies of  $\frac{1}{2}$  inch diameter. Although the boiler may be large and the supply up to the boiler and through the house is  $\frac{3}{4}$  inch, hot water cannot be drawn from the faucets any faster than the cold water enters the boiler through the boiler tube. Where the boiler tube is of wrought iron corrosion reduces its diameter still more. The brass boiler ells made with inside tapped to receive this tube are almost invariably tapped  $\frac{1}{2}$  inch. A long tailed cast bushing may sometimes be tapped to receive the threaded end of a  $\frac{3}{4}$ -inch tube, while for a connection high enough, a heavy 1-inch nipple may be tapped to  $\frac{3}{4}$  inch inside to receive the tube.

#### NOISE FROM STOPPAGE.

If instead of being in the supply pipe near the boiler the partial stoppage is in the service pipe in the basement or outside of the house line the same thing as above described occurs when the cold water faucet is opened as well. In such case the pressure is suddenly reduced at all points inside the partial stoppage, allowing steam to form and condense in the boiler in rapid pulsations when the conditions are right. On closing the faucet the pressure will be restored to the normal again, although the open passageway for the water may be no larger than the size of a pin. The only remedy for the above condition is the removal of the stoppage. If foreign matter of some sort has lodged in the curb stop, or in the corporation tap at the main, it may generally be removed by pumping several bucketfuls of clean water into the main through the cold water faucet at the sink. A little experience will quickly enable the plumber to judge by the action of the pump if the above is the case, or if the stoppage is the result of a general corrosion and filling of the pipe. Time spent in trying to clean out a corroded wrought iron service pipe is time wasted, and nothing short of renewal will permanently cure the trouble.

#### REPLACING IRON SERVICE PIPES.

It is often desirable to remove and replace a wrought iron service pipe without the necessity of digging up the entire length, as in the case of a handsome lawn and flower beds, or under a verandah. A length of from 18 to 40 feet in a section may be left undug, varying with the nature of the ground and the smoothness or roughness of the pipe to be removed. Short ditches should be opened along the line of the pipe in sections and the pipe cut apart. Beginning in the cellar a ring with set screws, or a bar of iron with a drilled hole of proper size is slipped over the end of the pipe, and a strong lever and fulcrum operated to draw the pipe out of the ground and into the cellar, shifting the hold as often as necessary. The pipe should be twisted with a wrench in the direction for screwing up while the pipe is being drawn inward. This operation may be repeated at each opening until the entire pipe is withdrawn. The new service pipe, with a good point screwed on the end, may be guided into the openings formerly occupied by the old pipe, and the lever and chains operated to push the new pipe into place, turning the pipe as before. A sledge may often be used to good advantage in driving the pipe in the ground. Care should be taken not to make the sections too long, or the strain on the pipes may be too great. Unless the character of the earth through which the pipe passes is favorable this method is not less expensive than to dig up the entire length.

#### TROUBLES FROM STEAM AND AIR POCKETS.

It sometimes happens when hot water is not drawn for some time that the upper part of the boiler is filled with steam, the expansion of which has driven out the corresponding bulk of water through the boiler supply and house service pipe. On opening the hot water faucet steam will issue and the water driven out will again flow back into the boiler. This operation, al-

though removing the danger of a still greater accumulation of steam, is attended with some noise and may give rise to the fear that something is wrong with the installation. This condition of things is quite normal, however, and represents the power of the apparatus to relieve itself of excessive strains. For this reason no check valve should be placed between the boiler and the main supply unless the boiler is provided with some other safety or relief valve. If the condition described above is of frequent occurrence a larger boiler should be substituted, or one or two radiators may be connected to absorb and radiate the surplus heat.

It sometimes happens that the water front becomes pitched at an angle which allows air to collect in the end opposite the pipe connections, as shown in Fig. 8. In such a case, when the water front gets hot enough to form steam, the air is driven out and the steam takes its place. On drawing water from the boiler the entering cold water finds its way almost directly to the return pipe leading from the boiler to the water front, condensing the little pocket of steam and producing a sharp rapping sound. If the inside supply extension reaches to within a few inches of the bottom this result is the more likely to occur and with a much greater racket than if the pipe ends a few inches below the side connection.

A bubble formed on the inside of the water front casting, from which the water cannot easily escape, will furnish a running accompaniment of raps which will continue as long as the casting is hot enough to form steam under the bubble or scale. Such a water front should be returned to the manufacturer and a perfect one substituted.

#### PIPES PITCHED WRONG IMPEDE CIRCULATION.

Circulation pipes pitched in the wrong direction are also productive of noise; not, however, from the same cause as above described. Where a pocket is formed in the pipes, in which air can collect, the circulation will be retarded and may be even entirely stopped for a moment. The consequent overheating of the water in the water front, when the range is hard driven, will produce a bubble of steam which will drive out the obstruction, and after coming in contact with the cooler water will condense suddenly. The vacuum thus formed will be immediately filled from both sides by the water producing a pounding, clattering noise.

The noise caused by partially clogged and corroded range connections and water front should be unmistakable and should be attended to at once. While the pipes are disconnected the water front should be tapped with a hammer to loosen any dirt which may cling to the inside of the casting, and the force pump should be applied to the upper connection until the water front is washed clean.

In many cities it is forbidden by the sanitary authorities to connect the boiler drain with the drainage system directly, and the arguments advanced are quite plausible. As any one who has taken down old range boilers knows, the interior becomes coated with large warts of rust, which easily crush under slight pressure of the finger. In case the stop cock connecting with the drain were left open foul air from the drainage system could pass freely into the boiler, tainting the entire interior surface. An evident advantage of the plain draw off faucet is that the condition of the water in the bottom of the boiler may be seen at a glance, and servants are more likely to take an interest in attending regularly to its cleansing. In substituting new connections for the old ones it should be the aim of the plumber to improve the arrangement of the piping as much as possible rather than to follow the beaten path of the man who made the connections previously. A more thorough knowledge of the principles involved, and an independence and openness of mind are thereby cultivated, the value of which will increase somewhat after the manner of money out at compound interest.

fortunate in the possession of a competent, courageous and generously disposed plumbing inspector, John Hopkins, who has started a vigorous crusade against those who offend against the regulations. Several offenders have recently been fined for their infringements.

## THE PLUMBING AND STEAM SUPPLY LEAGUE.

A meeting of the officers of the Plumbing and Steam Supply League was held at the Monarch Palace Alleys, Twenty-sixth street and Sixth avenue, New York, last Saturday afternoon, to arrange for the bowling tournament for the coming season. President Martin Behrer presided and ex-Secretary Rollin C. Wilson acted as secretary. Among those present were Treasurer Fred. Lowe, Captain W. S. Emery, William Murray, George Robinson, Louis Labiaux, William Carter and J. Walsh. The report showed that 24 teams had paid the entrance fee and met the qualifications to become members of the league. In consequence the rules were changed so that players qualifying to win the individual prizes must bowl not less than 14 games.

The teams entered are as follows:

*The Metal Worker*, the *Plumbers' Trade Journal*.

Manufacturers: H. P. Read Lead Works; National Lead Company; F. N. Du Bois & Co., No. 1; F. N. Du Bois Company, No. 2; John Simmons Company, No. 1; John Simmons Company, No. 2; Ashcroft Mfg. Company; Fred. Adey & Co.; Ronalds & Johnson Company, New York; Ronalds & Johnson Company, Brooklyn; Central Foundry Company, E. S. Wheeler & Co., Dimock & Fink Company and John A. Murray.

Salesmen: Jenkins Brothers, Behrer & Co., Colwell Lead Company, E. F. Keating, Lalance & Grosjean Mfg. Company and Crane Company.

In addition to the prizes offered by the league a number of prizes have been given by different concerns. The officers made the conditions under which they are to be contested for and prepared the following list:

#### TEAM PRIZES.

A handsome silver cup is given by the *Plumbers' Trade Journal* to the team winning the tournament, to become the property of the team winning it three times in succession. The league gives ten prizes, ranging from \$30 to the winning team to \$5 to the team finishing in the tenth place; also a prize of \$5 for the highest team score.

*Domestic Engineering* gives a half page of advertising for one year to the team making the highest average.

#### INDIVIDUAL PRIZES.

*The Metal Worker* offers a handsome fob chain to the member of the league who makes the smallest percentage of breaks. The American Porcelain Company offer two prizes, one to the individual making the best average in the tournament, the prize to have a value of \$15, and another to the member making the second best average, to have a value of \$10. The league offers three other prizes, of \$5, \$3 and \$2, for the members making the third, fourth and fifth best average. The league also offers a prize of \$5 for the member making the greatest number of spares during the tournament and a prize of \$3 to the member making the highest score.

A glance at the prize list and the list of houses represented in the league gives evidence that there is ample incentive for high class bowling and that the contests will not lack in interest. The officers are to be congratulated on the success of their efforts to again bring together so many representatives of the trade under social conditions that cannot but result in the establishment of confidence, which is always beneficial, among those who must do business either with or in competition with each other. Those who are familiar with the social spirit that was developed during last winter, and which culminated in the most enjoyable meeting of all the members at the closing dinner, when the prizes were distributed, look forward with no small amount of pleasure to the contests on the bowling alleys this winter.

The tournament will open on Monday night, September 29, when President Behrer and his team will meet the teams of *The Metal Worker* and the *Plumbers' Trade Journal*. The printed schedule is being prepared, and will be issued to the members at an early date.

MEMPHIS, TENN., is having the usual outcry and trouble that attend the enforcement of a modern set of plumbing regulations in a city where in the past the plumbing has been done in accordance with the ideas of the contracting plumber. The city, however, is for-

## THE EASTERN TRADE GOLF TOURNAMENT PRIZES.

Having given in the last issue of *The Metal Worker* an account of the first tournament of the Eastern Trade Golf Association, we now present a picture of

by E. C. Molby. To the right of this is the cup presented by the *Engineering Review* for the second prize for medal play, which was won by Frank H. Simmons. At the left again, on the back row, is shown the tall cup presented by the *Plumbers' Trade Journal* for the third class, which was won by Harry S. Martin. Beside it is the

*The Eastern Trade Golf Association Prizes.—Fig. 1.—The Group Picture.*

the different trophies, which it was impossible to get at that time. Photographs of the different cups have now been taken, however, and we present in Fig. 1 a group of the various trophies.

In the first row, on the left, is the cup presented by the president, C. H. Simmons, for the best medal play, which was won by W. H. Thayer of Boston, Mass. Be-

side it is a smaller cup presented by Bruce & Cook, for the runner up in the first class, which was also won by Mr. Thayer. The central cup is the association challenge cup, which must be won three times to become the property of the winner. This formed the first prize in the first class and was won by P. R. Jennings. At the right of it is the stein given by the association to the winner of the driving contest, which was captured

silver cup given by *The Metal Worker* for the fourth class and won by Howard W. Walton. The bronze figure in the center, which was presented by W. A. Russell & Co. for the best score for the first 18 holes, to be contested for by both Eastern and Western players, was won by Charles K. Foster. At the right of this bronze figure is the cup presented by

*Fig. 2.—The Metal Worker Cup, Won by Howard W. Walton.*

side it is a smaller cup presented by Bruce & Cook, for the runner up in the first class, which was also won by Mr. Thayer. The central cup is the association challenge cup, which must be won three times to become the property of the winner. This formed the first prize in the first class and was won by P. R. Jennings. At the right of it is the stein given by the association to the winner of the driving contest, which was captured

*Fig. 3.—The Domestic Engineering Cup, Won by Frank B. Barrett.*

*Domestic Engineering* for the third prize for medal playing and won by Frank B. Barrett. At the extreme right is the Pierce cup, given by the Pierce, Butler & Pierce Mfg. Company, and won by Frank C. McLain. In the back row are three pewter mugs, given by the association for the runner up in the different classes. These were "lifted" by A. W. Maine, Jr., for the second class,

Howard Hovey for the third class and P. H. Seward for the fourth class.

A strange coincidence developed in the selection of the prizes, *Domestic Engineering* buying in Chicago an exact duplicate of the cup purchased by *The Metal Worker* in New York City. As Editor Allen has traveled

Fig. 4.—The Plumbers' Trade Journal Cup, Won by Harry S. Martin.

abroad it is to be presumed that he possesses a cultivated taste, which reflects credit upon the scribe of *The Metal Worker* who selected an exactly similar cup, the same in size, design and weight as that which pleased Mr. Allen's fancy. An enlarged view is given in Fig. 2 of the twin presented by *The Metal Worker* and won by Howard W. Walton. The picture given in Fig. 3 was

Fig. 5.—The Engineering Review Cup, Won by Frank H. Simmons.

prepared by *Domestic Engineering* and shows the other twin cup won by Frank B. Barrett. The beautiful vase shaped cup presented by the *Plumbers' Trade Journal* and won by Harry S. Martin is shown in Fig. 4. The handsome cup shown in Fig. 5 was presented by the *Engineering Review* and won by Frank H. Simmons.

The Pierce cup, shown in Fig. 6, presented by the Pierce, Butler & Pierce Mfg. Company, was won by Frank C. McLain.

The scores presented in the last issue of *The Metal Worker* give evidence that good golf was played, and now that pictures of the different trophies can be seen it will be evident that there was ample incentive for every player to do his best. In view of the beauty of the trophies it is not surprising that enthusiasm was developed to the point that arrangements for a team contest between the East and West, for a punch bowl set offered by Charles K. Foster in behalf of the American Radiator Company, are well in hand. An attempt will be made to arrange this contest to come off in October. Evidently the Eastern Trade Golf Association and the Western Trade Golf Association are accomplishing

Fig. 6.—The Pierce Cup, Won by Frank C. McLain.

the objects of their organization when so many members of the trade are brought together under such pleasant circumstances and when the movement leads to such a generous spirit as is manifested in the prizes already given and won and to the contemplated contests of the future.

### MASSACHUSETTS MASTER PLUMBERS.

The quarterly meeting of the Massachusetts Master Plumbers' Association was held September 12 at Edgemere Park, Lake Quinsigamond. Nearly 200 members of the organization were present, including a large number from Boston, Holyoke, Haverhill and other cities of the State. The visitors were met at the station by a delegation from Worcester consisting of O. S. Kendall, John W. Green and J. C. Luby.

The party went to Edgemere on special cars over the Lake Shore line. On arriving at the grounds a light lunch was immediately served, after which the Worcester men entertained the visitors and showed them the many attractions of Edgemere. At 12.30 o'clock a clam dinner was served at the hotel.

After dinner an impromptu set of athletic games was held which furnished plenty of amusement for all. At 4.15 o'clock the entire party left the park and were the guests of the Callahan Supply Company in a trolley ride to the points of interest in the city under the supervision of Mr. Callahan. This proved the most enjoyable feature of the afternoon for the visitors.

The following committee had charge of arrangements: O. S. Kendall, J. W. Green, J. C. Luby, M. B. Holmes, J. P. J. Cahill, Charles Campbell and William Cahill.

THE DUPLEX HOT WATER HEATER COMPANY will move their manufacturing plant from Vermillion to Lorain, Ohio. A. H. Babcock, Jr., F. C. Whitlock and other Lorain capitalists have purchased a controlling interest in the enterprise and intend to build a new factory.

## PLUMBERS' SUPPLY ASSOCIATION.

The meeting of the Association of Manufacturers and Jobbers of Plumbers' Supplies at the Arena, New York City, last week, while largely devoted to the discussion of details of business of interest to the members, was also the annual meeting for the election of officers, and Frank J. Knox was unanimously re-elected president. The officers elected for the ensuing year are as follows:

*President*, Frank J. Knox, Hartford, Conn.

*First Vice-President*, Frank A. Buckman, New York.

*Second Vice-President*, W. H. Fleck, Philadelphia, Pa.

*Treasurer*, William McShane, Baltimore, Md.

*Secretary*, C. W. Woodward, Home Life Building, New York.

*Advisory Board*: Emery F. Souther, Boston; T. A. Calahan, Worcester, Mass.; John Reid, New York; John S. Hoy, Albany, N. Y.; A. P. Fell, Buffalo, N. Y., and John McPhail, Baltimore.

*Representatives on the National Committee*: Frank J. Knox, John H. Mueller, John McPhail, George T. Coppins and H. H. Fleck.

## Plumbers' Marble Manufacturers Meet.

The National Association of Manufacturers of Plumbers' Marble met at Hotel Carrollton, Baltimore, Md., on September 8, and held a short business session behind closed doors. The meeting was devoted to an exchange of views on matters pertaining to the trade. Among those present were William Buess and Joseph Kurlist, New York; F. J. Lantz, Buffalo, N. Y.; W. E. Higby, Proctor, Vt.; M. R. Brown, Rutland, Vt.; W. B. McMullan, Knoxville, Tenn.; J. F. Jacoby and Peter Gray, Philadelphia; T. W. O'Brien, Detroit, Mich.; H. C. Tibbitts and R. C. McDonald, Cincinnati, Ohio; Theodore Ahrens, Louisville, Ky., and John R. Hugg and C. L. Hilgartner, Baltimore, Md. At the close of the session those present accepted the invitation of N. H. Evans to make a short trip down the bay on his yacht, inspecting the harbor and the historic points, Fort McHenry and Federal Hill. Luncheon was served on the yacht. The next meeting of the association will be held at Knoxville, Tenn. The officers of the association are:

*President*, W. E. Higby, Proctor, Vt.

*Vice-President*, John Mueller, Cincinnati, Ohio.

*Secretary and Treasurer*, John R. Hugg, Baltimore.

## New York City Notes

The many friends of Isaac O. Shumway sympathize with him in the loss of his son, James Shumway, who died last Sunday from an attack of appendicitis. The funeral services were held on Wednesday and were largely attended by his friends in the plumbing trade.

\*\*\*

The Bronx Sewer Department has lately adopted a rule that the plumber applying for permits must show that he is registered in the Bureau of Buildings, and, in case of a new sewer, that the plan for the same has been approved.

\*\*\*

Manhattan Branch is getting in many new members on the possibility that the initiation fee will be increased to \$50 after October 15.

\*\*\*

John McGrath is busy with five private houses on Seventy-seventh street, opposite the Museum of Natural History, and a bonded warehouse on South street, near Burling slip.

\*\*\*

T. J. Byrnes is just starting work in the new Y. M. C. A. Building on West Twenty-third street running through to Twenty-fourth street, between Seventh and Eighth avenues. The plans for this building include complete physical apparatus, such as swimming tank, shower and needle baths, &c.

\*\*\*

Timothy F. Seannell has the plumbing contract for a nine-story apartment that is being erected by Philip

Braender of cellar drainer fame, at the corner of Central Park, West and 102d street.

\*\*\*

Among the plumbing jobs well under way are an apartment house, 50 x 85 feet and nine stories high, on Seventh avenue near 112th street, which is being done by S. Nechameus; a tenement on 101st street, near First avenue, by Charles Hensle; an apartment on 115th street, west of Lenox avenue, by Jos. Bloch, and an apartment on Seventy-seventh street east of Columbus avenue, by Poletcheck & Spencer.

\*\*\*

In the primary elections this week Plumbers Mat F. Donohue and P. J. Ryder were able to keep the Democratic leadership of the Twenty-first and Third Assembly districts respectively, Superintendent of Highways J. G. Collins aspired to lead the Thirty-third District, but was defeated.

## The Late "Boss" Shepherd.

The death at Batopilas, Mexico, on September 12, of Alexander R. Shepherd, formerly well known as "Boss" Shepherd, when Governor of the District of Columbia, removes a once very prominent figure of the national capital. Mr. Shepherd, who was born in Washington in 1835, started in life in that city as a plumber and built up a successful business in that trade, which he relinquished upon taking office as vice-president of the Board of Public Works of the District of Columbia. During his tenure of office, and afterward as Governor of the District, he initiated very extensive improvements in the city, but spent such immense sums upon them that he earned for himself great unpopularity and, as a consequence, the form of government of the district was changed from a territorial form to that at present prevailing, the Governor being succeeded by three commissioners. When President Grant appointed Shepherd as one of the commissioners the Senate refused to confirm him, and he returned to his plumbing business, but was subsequently forced into bankruptcy. In 1880 Mr. Shepherd went to Mexico, where he was fortunate in developing one of the greatest silver mines on the continent. Since that time his energies had been expended in working the mineral riches of Batopilas, where he made his permanent residence. As time passed the citizens of Washington awakened to a full appreciation of the great work which he had done in transforming their city from a mud hole into one of the beauty spots of the world, and when he returned for a brief visit a few years since he received an ovation.

## Steam and Hydraulic Valves, Fittings and Pipe.

The Crane Company, whose factories and headquarters are in Chicago, with branches in the leading cities of the country, have issued a complete pocket catalogue of the products which they manufacture, comprising 464 pages. This exceedingly convenient volume presents illustrations, price-lists and full detailed information relative to all their standard goods, such as globe, angle, check and cross valves, straightway valves, brass and iron cocks, iron and brass fittings, flanged fittings, engine and boiler trimmings, steam fitters' and engineers' tools, &c.; low pressure and medium pressure goods, such as iron straightway valves and flanged fittings; extra heavy goods, covering iron straightway valves, iron and brass globe, angle and cross valves, screw and flanged iron fittings and pipe bends; hydraulic goods, consisting of iron straightway and check valves, brass straightway globe and check valves and iron and brass fittings. A number of pages are devoted to brass, wrought iron and steel pipe. The catalogue also presents a great deal of data of interest to engineers and practical suggestions to fitters.

The heating system of the Central Building, Brace Memorial, Kensico, N. Y., will be remodeled and a new 1750 foot Steam Boiler will be installed. The new boys' dormitory, now nearing completion, will be heated by a 1250-foot Steam Boiler, both of Henderson Thermo pattern.

## Heating and Plumbing Notes.

THE SANDUSKY BOILER & PLUMBING COMPANY, Sandusky, Ohio, have been awarded the contract for heating and plumbing the new building of the Sandusky Automobile Company.

W. A. T. SMITH, agent for the Kelsey Generator in New Haven, Conn., has taken the contract for installing a battery of Kelsey Heaters in a new residence for W. F. Day. He is also putting in Heaters for Mrs. Gilbert and Mrs. Penney.

THE RICHMOND PLUMBING & MANTEL COMPANY of Richmond, Va., have been awarded the contract, amounting to about \$10,000, for plumbing the entire new six-story office building of the Atlantic Plumbing Company in Norfolk.

CHARLES D. MURRAY, president of the Merchants' National Bank of Dunkirk, N. Y., and a director of the United States Radiator Company, died on September 11, at his home in Dunkirk, aged 71 years.

E. M. OSMUN & SON, Hackettstown, N. J., are installing a 2750-foot Henderson Thermo Steam Boiler in the Methodist Episcopal Church of Hackettstown.

THE PRIESTLY GAS LIGHT COMPANY will establish a factory at Ames, Iowa, for the manufacture of Gas Apparatus and Fixtures.

THE Supervising Architect at Washington, D. C., will receive bids until October 8 for the drainage system and gas fitting of the Post Office, Court House and Public Buildings at Chicago, Ill.

THE Master Plumbers' Association of Philadelphia, Pa., held their regular monthly meeting at the Builders' Exchange on September 11, when George Swyer was appointed business agent for the association. After October 1 Mr. Swyer will have an office in the Builders' Exchange. An application was received from the Journeymen's Association for the appointment of a committee to confer with them on the regulation of apprentices.

CECIL L. SAUNDERS bid \$5546 and secured the contract for installing the boilers of the heating plant in the United States Marine Hospital at Cleveland, Ohio.

THE many friends of Charles A. Criqui, 922 Main street, Buffalo, N. Y., will be glad to learn that the fire in his plumbing establishment last week was extinguished with a comparatively small damage, which was covered by insurance.

ED. MORRIS, secretary of the Detroit Lead Pipe & Sheet Lead Works, Detroit, Mich., was entertained by C. W. Woodward this week, when he came to New York for the purpose of meeting his family, who had been enjoying a vacation abroad.

R. E. HARRIS, Macomb, Ill., has contracts to install two heating boilers for J. W. McIntosh, to put in gas and steam heat in the residence of Ira Sheets, to install a steam heating system in the residence of W. B. McDonough, and to do the heating and plumbing work in the residence of John Bell at Colchester.

THE controversy over the heating and ventilating of the Public School buildings of Buffalo, N. Y., which has been a subject of contention and discussion for some time, apparently is not yet to be dropped. The claim is now being made that the new system which was accepted is much more expensive in first cost than the system which was rejected, and that it does not accomplish the work which the rejected system was guaranteed to do. The new system is also said to require more fuel and supervision. In addition it has no guarantee back of it, and a portion of the buildings are left unventilated, which will add further to the cost of the heating and ventilating plant.

T. E. HULME of Portland, Ore., has turned in the following report of his work for one month: New buildings inspected, 68; old buildings inspected, 64; cesspools connected, 20; sewers connected, 54; written notices served, 34; reports of defective plumbing, 15; plumbing remodeled on notice, 6; total number of visits for the month, 556. Number of licensed plumbers in Portland, 42.

THE McLEOD COMPANY, New York and Chicago, manufacturers of Low Pressure, Standard and Extra Heavy Flanged Fittings, Cast Iron Pipe, &c., announce the completion of their new Flange Fitting and Pipe shop at New Brighton, Staten Island. The shop is equipped with overhead travelers and power derrick and has superior shipping facilities by both rail and water. The company are also increasing the capacity of their Chicago shop.

OIL WELL SUPPLY COMPANY, Pittsburgh, Pa., have issued a price-list, Section A, of Oil Well supplies, covering everything required to drill, equip and operate gas, oil and water wells, including Derrick Rigs, Boilers, Steam and Gas Engines, Drilling and Fishing Tools, Cables, Drive Pipe, Casing, Tubing, Line and Steam Pipe, Pumps, Sucker Rods, Fittings, &c.

THE AMERICAN RADIATOR COMPANY have added another floor to their building at the corner of Lake and Dearborn streets, Chicago, making the building six stories in height. They have removed the filing, invoicing, purchasing and advertising departments from the second to the sixth floor. These departments have grown so that more floor space was necessary.

WELLINGTON & MILLER, 167 Stratford avenue, Bridgeport, Conn., have contracted to install Ideal Boilers in the residence of George Prindle and in the Frack House at Seaside Park, owned by Dr. J. C. Lynch. They are also remodeling the steam plant in the Atlantic Hotel and the factory of the Bradley-Smith Company, New Haven, Conn., and are installing the heating plant and doing the steam fitting in the establishment of the Connecticut Abattoir & Oil Company.

THE COLORADO SPRINGS ELECTRICAL COMPANY, Colorado Springs, Col., have received the contract for heating and lighting the new County Court House. They will lay steam pipes to connect with the heating system in the building. Their contract is for heating the building to a temperature of 70 degrees between September 15 and June 1 of each year, for a term of five years. The contract price is 40 cents for 1000 pounds of water condensed, which will mean an expenditure of about \$2000 a year for heating the building.

THE PRIZER-PAINTER STOVE & HEATER COMPANY, Reading, Pa., and 160 Fifth avenue, New York, are sending out a little card showing a broken view of the Henderson Orbis Boiler, from which a good idea of the fire and water travel can be gained. These Boilers are round in form and rated to carry 900 feet of direct hot water radiation. The card presents enough information to interest the recipient in securing the catalogue of the company, with fuller particulars in reference to the Boiler.

THE GURNEY HEATER MFG. COMPANY, Boston, Mass., are sending to the trade an eight-page circular, 11 x 9 inches in size, devoted to the Gurney Bright Idea Sectional Safety Water Tube Steam and Hot Water Boilers. This size of page gives the company ample opportunity to show, by means of large broken views and special cuts, the internal construction and arrangement of the Boilers and their surfaces. These are so constructed that they afford little space for the accumulation of soot or other matter which will impede the transmission of the heat of the gases to the water or steam in the chamber. These Boilers are made in a variety of sizes, especially adapted for heavy duty, the largest sized Boiler being rated to carry 7250 square feet of direct steam radiation, or 12,000 square feet of direct hot water radiation. The circular will be of interest to those who are doing large work.

THE AMERICAN SLATE COMPANY, INCORPORATED, 1 Somerset street, Boston, Mass., announce that they have leased a store house and shop at 27 Bowker street, off Sudbury, where they propose carrying a stock of standard sizes of Laundry Trays, Kitchen Sinks, Shelves, Drain Boards, &c., for hurry orders. The company also have a stock of Slate Slabs of all grades, and skilled mechanics to do small work and rush orders at the above location. They add that their quarry facilities are better than ever and that they can make quick deliveries of quarry shipments. The concern are distributing

small blotters calling attention to their Sanitary Slate, Electrical Slate and Roofing Slate and Supplies.

#### New Firms and Changes.

JACOB DANKLEMAN, Chester, Pa., has recently started in the plumbing business at 43 East Tenth street, that city.

THE HARRISON VAPOR HEATING COMPANY of Portland, Maine, have been incorporated, with a capital stock of \$250,000, for the manufacture and sale of Vapor Heating Appliances and Generators. M. K. Teuney is the president of the company and P. J. Heudersou treasurer.

THE announcement is made that the firm of Rubenstein & Schulman, general and plumbing contractors, at 552 Grand street, New York, were dissolved on September 8 by mutual consent. Nathan Rubenstein continues the business of the late firm at the above address. He will also continue to manufacture the N. R. Patent Seat Attachment.

H. F. SHAW, Belchertown, Mass., has bought out the plumbing and tinsmithing stock of E. F. Hall & Son.

THE UNION BRASS WORKS COMPANY have been incorporated at Augusta, Maine, with a capital of \$100,000 for the purpose of making and selling the Soderlund Combination Faucet and Fixtures to same. The officers are: President, G. A. Soderlund; treasurer, C. E. Bowens of Somerville, Mass.

STEWART & ROMAINE MFG. COMPANY, Philadelphia, Pa., have bought out the business of the Philadelphia Expansion Bolt Works, and in future the latter plant will be known as the Philadelphia Expansion Bolt Works, Stewart & Romaine, proprietors. This gives the old concern of Stewart & Romaine Mfg. Company a much more extended list of expansions and designs in Expansion Bolts, making them exceptionally large producers of these goods. The company advise us that their past year's business has doubled that of any previous year, and that their foreign demand has increased to such an extent that they have two foreign agents to whom they make shipments every month.

THE BOSTON ELECTRIC FAN & HEATING COMPANY of New York City have been incorporated under the laws of the State of Delaware, with a capital of \$325,000.

CHARLES W. CLAPP, George W. Birchell and Joseph M. Justen of Toledo, Ohio, are interested in the organization of a company for the manufacture of a sanitary device invented by Mr. Justen.

THE YPSILANTI LUBRICATOR COMPANY, Ann Arbor, Mich., lately filed articles of incorporation, the capital stock being placed at \$10,000. The shares are divided as follows: Charles Glover, 520; Elijah McCoy, 230; Henry P. Glover, 125; Fred. C. Andrews, 125.

#### To Cement Porcelain Letters to Glass.

The following directions for cementing porcelain letters to glass are given in the *Show Window*: Shake 15 parts of lime in 20 parts of water. Melt 50 parts of caoutchouc and 50 parts of boiled linseed oil together and bring the mixture to a boil. While boiling pour the liquid on the slacked lime little by little under constant stirring. Pass the mixture while still hot through muslin, to remove any possible lumps, and let cool. It takes the cement two days to set completely, but when dry it makes a joint that will resist a great deal of pulling, whether from expansion or contraction.

The White Star steamer "Cedric," recently launched from the Harland & Wolff shipyard at Belfast, Ireland, is claimed to be the biggest ship afloat. While slightly less in length than the "Oceanic" of the same line, the "Cedric" is 4000 tons the heavier of the two and she exceeds her sister vessel, the "Celtic," by 100 tons. The length of the "Cedric" is 700 feet, her beam is 75 feet, her depth 49½ feet, and her gross tonnage 21,000 tons. Her displacement at her load draft will be 37,870 tons. She will have nine decks and accommodations for 3000 passengers and a crew of 350. She will probably be completed to take her place on the Liverpool and New York service late in the autumn.

#### THE TIN PLATE MILLS.

It is estimated by competent authorities in the trade that fully 100 tin plate mills in various parts of the country are at present idle. This idleness has been caused largely by the fact that the American Tin Can Company, who are the largest consumers of coke tin plate, have been obliged to limit their operations on account of the slackness of demand for cans this season. The can company bought liberally last season in anticipation of much larger crops than were produced, consequently they are understood to have carried over a very heavy stock of plates into the present season. But the canning business this season is again smaller than was anticipated, owing to a falling off in the salmon catch and a shortage in some vegetable crops, and the demand for cans has been below the average. Although the canning season is now at its height, it is understood that the stocks of plates already in possession of the American Can Company will be sufficient to cover about all their requirements without placing any more important orders with the American Tin Plate Company, who practically have the monopoly of their custom.

Had the tin plate workers agreed to the proposition of the American Tin Plate Company to accept a reduction of wages on work on tin plates for export, the present dullness of trade would probably have been alleviated. It is calculated that if the tin plate company could secure the business of the exporting packers, amounting to about 1,500,000 boxes annually, they could provide steady work for their mills for ten months out of the year. It is a well-known fact that the present tin plate capacity of the country, if all employed, would produce 15 or 20 per cent. more plates than are required for domestic consumption. Consequently, until either the export tin plate business is secured, or foreign markets are developed for American tin plate, the tin plate mills must remain idle for about one-fourth of the year, or else a proportion of them must be shut down for an indefinite period. In either case the workmen must suffer a serious diminution in their annual wages. In view of these facts it seems that it would have been wise on the part of the Amalgamated Association mill men, in their own interests, to accede to the proposition of the American Tin Plate Company.

MORE than one local lodge of the Amalgamated Association have held meetings lately to reconsider their decision on the wage concession proposition of the American Tin Plate Company, and usually the result has been in favor of granting the concession. It seems to be a case with the Tin Plate mill men of making a choice between evils and accepting that which they consider the lesser of the two. In one case a lodge is understood to have asked the officials of the Amalgamated Association to call a special convention of the association to pass upon the rebate scale question. Should this idea be acted upon it is more than likely that an affirmative vote would be obtained. In cases of this kind a decision to reconsider is almost always tantamount to a reversal of the original decision.

THE GENERAL FIRE PROOFING COMPANY of Youngstown, Ohio, manufacturers of the Herring-bone Expanded Metal Lath, whose plant at Niles, Ohio, recently was destroyed by fire, will start up their new works about September 25. They have been working day and night since the fire getting machinery placed so as to be able to fill the large orders which they have on hand. The Pittsburgh Construction Company of Pittsburgh have the contract for the work, which is being executed according to plans drawn by and under the supervision of Armin Schotte, consulting engineer, of Pittsburgh.

THE AMERICAN SLATE COMPANY, INCORPORATED, 1 Somerset street, Boston, Mass., announce by means of a small blotter that they keep in stock and for sale small quantities of Roofing Slate, Roofing Cement, Roofing Paint, Slaters' Tools, Snow Guards, &c., for repair work. at their shop and storehouse, 27 Bowker street, Boston.

### Moomaw's New Century Shingles.

The Chattanooga Steel Roofing Company, Chattanooga, Tenn., are manufacturing Moomaw's New Century patent shingles, of which an illustration is given herewith. The principal feature of this steel shingle is the embossed center, which gives it a very artistic ap-

*Moomaw's New Century Shingles.*

pearance. Moreover, the shingle is furnished with a special locking device, which the manufacturers claim makes it absolutely water tight. The shingles are meeting with great favor among architects and builders wherever used, and the makers solicit correspondence from roofers with a view to bringing it to more general notice.

### The Lovell Window and Shutter Operating Device.

The device which has recently been brought out by the G. Drouve Company, Bridgeport, Conn., for operating sashes and shutters is adapted to operat-

*The Lovell Window Opening Device.—Fig. 1.—The Device Applied to a Row of Windows.*

ing a line of sash 500 feet long from one station, if desired. Illustrations are presented herewith of the device as attached to a line of sash, and of the principal parts which compose it. The apparatus is stated to work equally well with sash hung from the top, pivoted at the sides, pivoted at the top or bottom, or hinged at the bottom. It can also be applied to sliding or ordinary lifting windows. Fig. 1 shows the device as applied to a row of windows. The photograph from which this

illustration has been made shows a line of 320 feet of sash operated from one station just erected in a Bridgeport factory.

The movements of the sash are effected by two rods actuated by a pinion and rack, so that a turn of the wheel moves one of the rods forward and the other backward. Link arms connect the operating rods to the sash. When the windows are elevated, as for instance in a lantern on the top of a building, a chain passing around the wheel enables it to be easily operated from any point below. Fig. 2 is a front elevation of one of the windows closed, with the link arms attached to the

*Fig. 2.—Front Elevation of One Window Closed.*

rods and sash. The arrows show the direction in which the operating rods are adapted to move. Fig. 3 represents one of the adjustable hangers for supporting the operating rods. The openings are so arranged that the hanger can be fastened through holes in the foot or in the face to meet the requirements of the position in which it is to be attached. It is constructed in two parts connected at the center by bolts which permit adjustment to a reasonable length. The operating rods pass through the two square openings at the left of the hang-

*Fig. 3.—Adjustable Hanger to Support Operating Rods.*

er and are supported by anti-friction rollers. Fig. 4 shows a broken view of one of the link arms which connect the operating rods to the sash. The forward end of this link arm is pivotally supported to a clip which is swiveled to the sash plate. The other end of the link arm is swiveled on a headed pin, which also pivotally connects the arm link to a clip swiveled on a collar, through which the operating rod passes. The collar is secured to the operating rod by a set screw.

The operating station for an entire building can be

*Fig. 4.—Broken View of Link Arm Connecting Sash Plate with Operating Rod.*

placed on a wall at the end or side of the building. In case of fire the windows can then be quickly closed while the occupants are leaving the building. This is a feature which appeals to the owners of factories and mills. The company have taken contracts for the installation of the apparatus in a number of large buildings both in the East and West.

## Pattern for Twisted Square Shaft of Curved Profile.

**Problem:** Where a square shaft of curved profile is twisted to such an extent that the top plane will make a quarter turn, to draw the plan and elevation of the shaft, also the pattern for its sides.

A correspondent in Baltimore, Md., writes: "I forward to you a small clay model of a twisted square shaft and would be pleased to have you show me

Pattern for Twisted Square Shaft of Curved Profile.—Fig. 1.—View of Correspondent's Model.

through the columns of *The Metal Worker* how to draw the plan and elevation, also the correct pattern shape for one of its sides."

In Fig. 1 is shown a view of the model. It may be well to remark that it is impossible to obtain a strictly true pattern for the shaft. While the pattern shown in

From these intersections parallel to the center line drop lines into the plan and obtain the horizontal sections in plan view, as shown by 1", 2", 3", 4" 5" and 6".

Using these horizontal sections in plan and elevation the twisted plan and elevation will be constructed as follows: From the various heights 1 to 6 in elevation extend the horizontal lines indefinitely, as shown. Now take a tracing of the various sections 1" to 6" in plan and place them in the twisted plan in such positions, gradually turning each plane until the side X of the plane 1" in plan has been turned one-quarter, or 90°, as shown by X in the twisted plan. As five planes are twisted divide 90° by 5, making 18°, the difference in twist given to each plane. In other words, the side of the plane 5 5' should be placed at an angle of 18 degrees to the side of the plane 6 6'. In similar manner the side of the plane 4 4' should be placed at an angle of 18 degrees to 5 5', &c., until all of the planes are in their proper positions, as shown by 5", 4", 3", 2" and 1" in the twisted plan. Then through the corners draw the miter lines 1" 6", 1' 6', 1° 6°, and 1° 6°, which completes the plan view of the twisted shaft.

For the twisted elevation project lines from the various corners of the sections on the miter lines 1" 6", 1' 6', 1° 6' and 1° 6° in plan, intersecting similarly numbered lines in elevation, as shown respectively by 1" to 6", 1' to 6', 1° to 6' and 1° to 6°. A line traced through these points will be the twisted elevation.

The next step is to develop the true length of one of the miter lines, the four being similar. To do this draw any horizontal line, as L M, upon which place the stretchout of the horizontal projection of the miter line 6 5 4 3 2 1 in the twisted plan, as shown by similar numbers on L M. From these points at right angles to L M erect lines intersecting similar lines drawn from

Fig. 2.—Plans, Elevations and Developed Miter Lines and Triangles.

Fig. 3 is geometrically correct, it will, however, require some stretching on its edges to bring it to the required curve and twist.

In Fig. 2 let A B C D represent the elevation of the shaft without the twist, the section on D C being shown in plan by H I J K, and the section on A B in elevation by 1" in plan. Draw the center line through the plan and elevation, as shown by E F G. The curves A D and B C are drawn at pleasure. Now divide E F into an equal number of spaces and draw the horizontal planes 1, 2, 3, 4, 5 and 6, intersecting the curve B C at 1' to 6'.

the points in the elevation, thus obtaining the intersections 1x to 6x, through which trace a line, which will be the developed miter line.

As the pattern will be developed by triangulation a set of triangles must be obtained on dotted lines drawn from 6' to 5, 5' to 4, 4' to 3, 3' to 2 and 2' to 1 in plan, whose altitudes are equal to the vertical heights of the planes in elevation. Draw any horizontal line, as 5 0 in Y, equal to 5 6' in the twisted plan. At right angles to 5 0 draw O N, equal in height to one of the spaces between the vertical planes in elevation. Draw a line

from N to 5 in Y, which is the true length on 6' 5 in plan. In similar manner, as shown in Y, obtain the true lengths of 5' 4', 3, 3' 2 and 2' 1. It should be understood that the solid lines in plan represent the true lengths of the horizontal planes in elevation.

For the pattern proceed as follows: Draw any horizontal line in Fig. 3, as 6' 6', equal to 6' 6' in plan in Fig. 2. Now with 6x 5x in the developed miter line as radius and 6 in Fig. 3 as center describe the arc 5, which intersect by an arc struck from 6' as center and N 5 in Y in Fig. 2 as radius. Now again using 6x 5x in the developed miter line as radius and 6' in Fig. 3 as center describe

Fig. 3.—The Pattern Shape.

the arc 5', which intersect by an arc struck from 5 as center and 5' 5 in plan in Fig. 2 as radius. Proceed in this manner, using alternately as radii first the divisions in the developed miter line, then the length of the slant lines in the diagram of triangles, then again the length of the divisions in the developed miter line, then the length of the solid lines in plan, until the line 1' 1' in Fig. 3 is obtained. Trace a line through the points thus obtained. Then will 1' 1' 6' 6 be the pattern shape.

If the pattern shown were slightly bent upon the solid and dotted lines, right and left, the pattern would assume the shape shown in Fig. 4. In other words, it would turn from 6' 6' at the bottom a quarter circle and meet 1' 1' at the top. This, however, would show cor-

Fig. 4.—Model for Stretching.

ners on the surface, which is not desired, and for that reason, as before explained, the edges will have to be stretched. Before the stretching is done a model should be constructed, as shown in Fig. 4. A represents the size of the bottom of the shaft, in the center of which place a square shaft equal to the height of the twisted shaft and in size equal to its top. Then using the pattern just developed the edges are stretched until the desired curve and twist are obtained. It is then fastened temporarily and the next side stretched to fit the corners 1' 6 and 1' 6'. We would suggest that whatever the size may be the shaft be worked from soft copper, which stretches easily to the desired shape.

## PENNSYLVANIA'S TIN PLATE PRODUCTION IN 1901.

The remarkable increase in the manufacture of tin plate in Pennsylvania since the industry was first given an opportunity is set forth in the following figures from the forthcoming report of James M. Clark, chief of the Bureau of Industrial Statistics, Harrisburg, Pa., for 1901:

The capital invested in the tin plate works in Pennsylvania manufacturing their own black plate was \$10,525,000, an increase over 1900 of \$753,112, and an increase over 1896 of \$6,897,725, or over 190 per cent. The production of black plate in pounds was 435,628,000, an increase over 1900 of 123,626,000 pounds, and an increase over 1896 of 277,321,510 pounds, or over 175 per cent. The total output of tin plate made by the black plate works and the tin plate dipping works combined was 421,640,000 pounds, an increase over the production of 1900 of 123,786,000 pounds, and an increase over 1896 of 282,051,297 pounds, or over 200 per cent. The value of the entire output tinned and untinned was \$17,612,030.

In the black plate tin works 8188 workmen were employed, an increase over 1900 of 794, and an increase over 1896 of 4994 persons, or over 156 per cent. The average yearly earnings, skilled and unskilled, was \$561, an increase over 1900 of \$84, and an increase over 1896 of \$104.45, or 22.9 per cent. The average daily wage, skilled and unskilled, was \$2.46, an increase over 1900 of 6 cents, and an increase over 1896 of 66 cents, or 36.7 per cent.

## The Canonsburg Steel & Iron Works.

The Canonsburg Steel & Iron Works, recently organized at Canonsburg, Pa., have purchased the rolling mill at Canonsburg, Pa., formerly owned and operated by the American Tin Plate Company, and previous to that by the Canonsburg Iron & Steel Company of Pittsburgh, Pa. They are now engaged in improving and repairing the works and expect to have the plant in operation about January 21, 1903. They propose to make steel and iron sheets used for deep drawing, stamping, enameling, tinning, galvanizing, japanning, bicycles, show cards, stove and range work, tune sheets, &c. John F. Budke, formerly connected with the Canonsburg Iron & Steel Company in the capacity of general superintendent of the works, is the president and general manager of the company. The company have a capital of \$250,000, and the officials are: John F. Budke, president; John M. Watson, vice-president; William H. Paxton, treasurer, and George W. Retberg, secretary.

## Webster Aluminum Solder.

Joseph Carl Webster of Philadelphia has been granted a patent on an aluminum solder of his invention, consisting of a mixture of lead, tin, aluminum and zinc. For hard solder used for heavy work these ingredients are combined in the following proportions: 5 parts of tin, 4 parts of lead, 6 parts of aluminum and 1 part of zinc. For small or lighter work the following proportions are used: 6 parts of tin, 5 of lead, 4 of aluminum and 1 of zinc. The inventor claims that the above composition forms an alloy which melts at a considerably lower temperature than the aluminum or parts of metal to be soldered, while no flux or scraping of the aluminum to remove the oxide is required, it being found that the oxide that forms on the aluminum will not affect the joining of the metals when the proper heat is obtained. The usual brazing fire of gas and air to impart a high heat is employed in using this solder. The claim is made that after a joint effected with this solder is cooled and finished it presents the appearance of pure aluminum and will not oxide or tarnish.

THE SHEET STEEL COMPANY, recently organized in Pittsburgh, and who have taken over the Tuscora Steel Company, at Newcomerstown, Ohio, have opened offices in Room 805, Lewis Block, Pittsburgh. The new concern are manufacturers of fine Steel Sheets for special purposes.

## FLASHINGS.

THE GRUSON IRON WORKS of Eddystone, Pa., through their representatives, F. R. Phillips & Sons Company of Philadelphia, Pa., have been awarded a contract for a Tin Plate plant to be erected in Italy. The plant will consist of three hot and four cold mills and all other equipments in American modern mills. F. R. Phillips & Sons Company also have the contract for the Tin machinery in connection with the above. This is the first American contract for Tin mills to go abroad.

THE Logansport Tanners' and Sheet Metal Workers' Association of Logansport, Ind., were organized at a meeting of the local tanners and sheet metal workers held on September 6. The following officers were elected: President, Joseph Fettig; vice-president, William Ensfield; recording secretary, H. Geyer; financial secretary, J. R. Schmock, and treasurer, F. Otto, with G. Mechaffie, J. Fettig and H. Geyer as trustees.

W. S. BULLARD, Bridgeport, Conn., has begun the work of roofing the new building of the American Graphophone Company, in that city, with Plastic Cement. He has also taken the contract for roofing two more buildings for the American Tube & Stamping Company.

STATISTICS published by the *Times* of Seattle, Wash., show that the total salmon pack of Alaska, British Columbia, Puget Sound and the Columbia River region this year amounted to about 3,281,000 cases up to date, as compared with a total pack of 4,549,800 cases in 1901. This indicates that there will be a shortage of about 1,300,000 cases this year as compared with last. This fact will have an important bearing upon the consumption of Tin Plate by the salmon packers of the Northwest this season.

LAWRENCE SANDS AND C. J. HEINZ of Wheeling and E. R. Line of Clarksburg, W. Va., are forming a company to operate Roofing Slate quarries at Martinsburg, W. Va. The promoters expect soon to be making a large output of No. 2 Slate.

THE CLIMAX TIN MFG. COMPANY of Boston, Mass., have been incorporated with a capital stock of \$5000. Charles Rawson is president and treasurer of the concern.

BESEMAN & BOSTWICK, Hartford, Conn., have secured the metal work on the new theater at South Framingham, Mass., and have started on a contract at the Home for Incurables in Newington. They have just completed several Skylights for the Neal, Goff & Inglis Company and a good sized contract for roofing on the residence of Charles Hopkins Clark.

THE REYNOLDS BRANCH of the American Tin Can Company at Havre de Grace, Md., was destroyed by fire on September 16 with a loss of between \$40,000 to \$50,000, partly covered by insurance.

THE NEWPORT ROLLING MILL, Newport, Ky., is reported to be in steady operation in all departments.

THE first six months' business of the Parkersburg Iron & Steel Company, Parkersburg, W. Va., was very pleasing to the stockholders. The new Bar mill was put in operation September 8 and is working splendidly.

EDGAR MURRAY, formerly with the Carnegie Steel Company, at Pittsburgh, has been made purchasing agent of the Youngstown Iron, Sheet & Tube Company, at Youngstown, Ohio.

THE UNITED STATES WORKS of the American Tin Plate Company, at Demmler, Pa., are practically idle. This plant contains 11 Sheet and pair furnaces, 6 annealing furnaces, 11 hot and cold mills, and has a weekly capacity of 7000 boxes of Tin and Terne Plate.

THE CHATTANOOGA STEEL ROOFING COMPANY, Chattanooga, Tenn., are now, as they have been for some time, kept busy in their different lines. They are manufacturing largely Galvanized and Cast Iron for store fronts. They have also a good demand for their Drip-ping Pans and Moomaw's Patent Tin Shingles.

THE NATIONAL WORKS of the American Tin Plate Company, at Monessen, Pa., are being operated to full capacity and have not been affected in any way by the

shut down at other Tin Plate plants. The National Works contain 24 Sheet and pair furnaces, 6 annealing furnaces and 24 hot and 18 cold mills. The output of the plant is 50,000 gross tons annually of Black Plate for tinning on triple turn, and 20,000 boxes weekly of Tin and Terne Plate, running double turn. P. E. Donner is manager of this plant.

FEE & MASON, 68 Beekman street, New York, are issuing two little circulars devoted to Pipe Hangers. The F. & M. Extension Pipe Hanger is constructed with grooves on the stem of the Hanger, so that it is capable of an adjustment of about  $3\frac{1}{2}$  inches.

GARA, MCGINLEY & Co., 23 South Seventeenth street, Philadelphia, roofers in Tin, Slate, Tile and Slag and Architectural Sheet Metal workers, are making use of a very striking little circular to draw attention to their business. It is of dark gray paper, ornamented on one side with pictures in red, green and black, and bears on the other side an invitation to call for the services of the firm in examining, repairing or fixing roofs, gutters, spouts, &c. A reply postal card accompanies the folder.

## The Little Badger Electrically Driven Grinder.

The grinder here illustrated is essentially a bench tool, being small enough to be placed anywhere on the tool bench. The base is heavy enough to keep it in position even if not bolted down, although provision is

*The Little Badger Electrically Driven Grinder.*

made for fastening it if desired. The motor is placed between the wheels which are carried by the armature shaft. It is mounted on a swivel base, which allows it to be swung a quarter turn in either direction. This is a desirable feature in that it enables the workman to often obtain a better light on his work and facilitates the grinding of irregular and large pieces. The motors are inclosed, preventing dust, dirt or grit from damaging the commutator, armature or bearings. The tool rests are adjustable, so that either the face or side of the wheel may be used. The bearings are provided with lubricating devices which will last for a long time, and when finally worn out can be quickly replaced. An automatic cut off switch is placed inside the stand. The machine occupies a space 13 7-16 x 18 inches, and is 14 inches high. It is manufactured by the Northern Electrical Mfg. Company of Madison, Wis., the exclusive sales agents being the Mechanical Appliance Company of Milwaukee.

Perhaps no quality is more characteristic of the work of Booker T. Washington than the sanity of his point of view. His article, "Problems in Education," in the September *Cosmopolitan*, deals not only with the work of Tuskegee Institute, but with the educational needs of the entire colored population of the United States. The race problem is not one which can be left to settle itself, and every thinking man or woman should read this valuable contribution to a discussion whose importance will increase rather than decrease in the years to come.

## THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

### A ROOF AROUND A TREE.

From Iron Roofer, Ontario, Canada.—If "J. M." of Washington, D. C., whose communications in regard to a roof around a tree were printed in *The Metal Worker* of August 2 and 23, will flash the tree in the following manner, he will secure a flashing that will be rain proof, snow proof, &c.: Put a strip of iron 8 inches wide around the tree 2 inches away from the tree all around and solder it to the roof. Next make a cylinder 20 inches in diameter and 6 inches deep, this cylinder to be in two halves. Put a flat top on the cylinder, also in two halves. Then cut in the top a hole of the same shape as the tree, at the place where it is to fit around the trunk, but make the hole 1 inch larger all around. Solder a strip 2 inches wide around this hole. Procure a piece of leather 1 inch wide,  $\frac{1}{4}$  inch thick and  $6\frac{1}{2}$  feet long, and wind it around the tree twice, so as to make it  $\frac{1}{2}$  inch thick on the tree, and secure it to the tree with not more than four or five carpet tacks. Then get some canvas and cut it to make a cone 20 inches in diameter at one end and 16 inches at other end and 8 inches deep. Rivet the canvas to the bottom of the two halves of the cylinder and bind the small end of the canvas cone to the top of the strip on the roof, after placing the two halves of the cylinder around the tree. Then secure the hood around the leather, as shown in the sketch herewith,

A Roof Around a Tree.

fastening it with tacks  $\frac{1}{2}$  inch long, and pour some melted pitch onto the leather to cement the iron to the tree.

### THE EFFECT OF INCREASED PRESSURE IN HEATING.

From F. N. P., Norwich, N. Y.—Will *The Metal Worker* kindly answer the following question: If 10 square feet of direct radiation will heat 500 cubic feet of space with steam at 5 pounds pressure, how many square feet of radiation will be required to heat the same space at 20, 30, 40, 50, 60 and 70 pounds steam pressure?

**Answer.**—The heating power of a radiator increases approximately in proportion to the temperature of the steam above zero pressure (212 degrees). From the steam table we find for 5 pounds pressure 228 degrees; 20 pounds, 259 degrees; 30 pounds, 274 degrees; 40 pounds, 287 degrees; 50 pounds, 298 degrees; 60 pounds, 307 degrees; 70 pounds, 316 degrees. The increase of efficiency for each increment of pressure and temperature above 5 pounds will be, approximately, for 20

pounds  $\frac{228}{259} = 0.88 \times 10 = 8.8$  square feet of heating surface, and so on for each increment of higher pressure—

viz.,  $\frac{228}{274} = 0.832 \times 10 = 8.32$  square feet for 30 pounds pressure, 7.95 square feet for 40 pounds, 7.65 square feet for 50 pounds, 7.42 square feet for 60 pounds and 7.21 square feet for 70 pounds steam per square inch.

### CORNICE MITER PATTERNS.

From G. E., New York.—Please inform me through *The Metal Worker* how to cut the patterns for a cornice making a square miter with a cornice of reduced projection, and also how to obtain the patterns of a cornice meeting another cornice of reduced projection at any

Cornice Miter Patterns.

other angle than a right angle, both cornices being horizontal.

**Answer.**—Our correspondent will find it very easy to do this if he first makes his drawing as is shown in the accompanying illustration, in which A is the profile of the main cornice, B the profile of the cornice of reduced projection which makes a square miter with the main cornice, and C the profile of a cornice of reduced projection mitering with the main cornice at some angle other than a right angle. To obtain the pattern for the main cornice draw the stretchout line 1 to 8 perpendicular to the edge of the cornice. On this lay out the distances 1 to 2, 2 to 3, 3 to 4, &c., taken from profile A. Through the points thus obtained draw lines at right angles to the stretchout line. Then from where the numbered points on the profile miter against the other cornices draw lines parallel to the stretchout line, intersecting the numbered lines crossing the stretchout line as shown. Connecting the points thus obtained, the resulting figure will be the pattern of the main cornice. The pattern for the other cornices are obtained in the same manner.

Particular attention is given to the cutting of patterns for cornice miters in "The New Metal Worker Pattern Book," which can be obtained from our Book Department.

### REPAIRS WANTED FOR NEW ENGLAND RANGE.

From O. L. D., Memphis, Tenn.—In reply to the inquiry of "W. L. S." in *The Metal Worker* of September 6, I would say that the range described, bearing the name of New England Range Company, was made by the H. Wetter Mfg. Company, Memphis, Tenn.

From H. B., Niantic, Conn.—In reply to the inquiry of "W. L. S." in *The Metal Worker* of September 6, I would say that John Huse & Son, 95 Blackstone street, Boston, Mass., can furnish repairs for the range made by the New England Stove Company of Taunton, Mass. Repairs can also be furnished by the Taunton Iron Works of Taunton, Mass.

### PROTECTING PARTITION PIPES.

From B. W., Ontario.—I should be glad to have the readers of *The Metal Worker* give their experience as to what makes a proper protection for the tin hot air pipes which run up in partitions from hot air furnaces. When the partitions are of lath and plaster are two coats of asbestos paper sufficient protection from fire, providing no iron lath be used?

### WILL FURNACEMEN HELP?

From Nutmeg, Connecticut.—The sketch submitted herewith, with sizes of registers, pipes and furnace, may be of some service to "A. S.," who makes an inquiry of furnacemen in *The Metal Worker* of August 30. The furnace should not have any less than a 50-inch casing and a 28 or 29 inch fire pot. The two cold air ducts can be made to intersect each other at X and work all right, providing a baffle or division plate is put in at an angle to lessen the friction. The main cold air duct at O must have a total area equal to that of the other two leading from the cold air registers. The registers, both hot and cold air, can be shifted from the places indicated on the sketch, yet it would be well to follow the plan of the sketch to get good results. Of course the cold air registers should have no valves. The heating chambers in the cold air ducts should be placed in the cellar as indicated in the sketch. The hot air pipes can be one size

Will Furnacemen Help?

larger if desired, but I see no need of making them larger than I have designated if the proper size of furnace and good coal are used.

### WANTS INFORMATION ON SOFT COAL BURNING.

From M. K. & H.—We desire to gather certain information in regard to the use of bituminous coal in heaters generally, and in the Kelsey particularly, and with this object in view that we may better enlighten our customers as to the use of soft coal, we ask for answers to the following questions, or such information on the points raised as will help us:

What kind of soft coal do you use?

What kind of soft coal do you recommend?

After the fire is started how often does it require attention?

Do you advise a deep fire or a shallow fire?

Can the fire be carried over night?

If it can, how best, and how do you leave check dampers and draft dampers?

How do you operate the heater in general to get the best results?

Do you find the admission of air above the fire a benefit or not?

How often does the heater require cleaning?

If you have used anthracite coal would you say it requires more or less bituminous coal to do the same work?

Is much stoking of fire required, and if so, below or above the fire?

Have you burned coke, and if so with what results, and how do you regulate the drafts?

Have you mixed coke and bituminous coal, and if so with what result?

Have you mixed coke and anthracite coal, and if so with what result?

How does bituminous coal affect the life of the heater.

What is your opinion in general of bituminous coal as fuel for house heating apparatus?

Do coke or bituminous coal affect the grate if the ashes are properly removed from under the grate?

Answers to the above questions, and any other information relative to the use of soft coal in heating apparatus will be greatly appreciated.

### MAKING A RUST JOINT.

From W. H. P., Haddonfield, N. J.—Will *The Metal Worker* give me the best formula for making a rust joint on a greenhouse hot water heating system, where 4-inch cast iron pipe with bell and spigot ends are used for the heating service?

Answer.—Rust joints in cast iron pipe are made by using iron filings with sal ammoniac or salt water. The iron filings, or turnings, should be not so fine as to resemble dirt, but rather coarser. They should be of soft iron and free from dirt and grease. An experienced greenhouse heating contractor favors the use of iron filings wet down with water that is slightly salt in preference to the use of sal ammoniac. If the water is too salt, or too much sal ammoniac is used, there is a tendency toward the generation of heat, and the expansion of the iron filings is sometimes sufficient to crack the hubs of the pipe. In order to prevent the filings from getting into the inside of the pipe and to hold the spigot end centrally in the hub it is well to calk the joint with oakum before the wet filings are inserted. These should be tamped lightly into place, but not tight enough to cause a cracking of the hub when the expansion, due to the heat generated by the salt, takes place.

Another method of making joints in greenhouse pipes is to use alternate layers of oakum and red lead. The success of this joint depends on the quality of the red lead used. Sometimes Portland cement is used instead of the red lead between the layers of oakum. Joints made in this way will harden sufficiently to stand the circulation of water under a slight pressure inside of 24 hours. With a little experience these joints can be made so that standing over night they will be tight.

### SIZE OF CATALOGUES.

From Brown & Wales, Boston, Mass.—We notice in *The Metal Worker* of August 30 your suggestions in reference to the size of catalogue. We think it a good one, and that it is very desirable to have these publications so that they can be more readily filed. If you could find out what is the most commonly used size we think those who issue catalogues will be glad to adopt a standard size.

Note.—We shall be glad to receive from our readers any suggestions bearing upon this subject. Obviously it would be out of the question for all manufacturers to adopt one standard sized catalogue, as there are some goods which require a large size for their proper illustration. But it would seem perfectly feasible to establish, say, three standard sizes, or possibly four, one of which would be suitable for every class of goods made. It appears that the most popular and at the same time the most convenient size of book is about 6 x 9 inches. With a smaller one of pocket size and a larger one to take in such illustrations as are used by metal ceiling manufacturers, for example, we believe that the advertising necessities of all manufacturers would be covered. There is no doubt that a wide demand exists for the standardization of catalogues, and the time seems ripe for taking up this matter definitely.

### PATTERN FOR A CHIMNEY TOP.

From M. L., Albany, Ore.—In regard to the patent ventilator mentioned by Henry Weyand, Waterbury, Conn., in *The Metal Worker* of August 16, would say that I have seen this ventilator in London, England, in the year 1878, and believe it is patented in that country. Just the same drawing as was given in *The Metal Worker* of August 2 will be found in more than one of the standard technical books on sheet metal work.

### WHO MAKES THE COUCH DAMPER?

From H. E. B., Leominster, Mass.—We shall be glad to learn the name of the manufacturers of the Couch heat deflecting pipe damper. It is a cast iron damper in three sections, and the end of the damper rod has a cast iron hand for a handle.

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** is extremely dull, and about  $\frac{1}{2}$ c. lower in price.

**Copper** is very quiet and weak.

**Pig Lead** is in fair demand, and prices are firm.

**Spelter** is dull, but scarcity of spot makes the market firm.

**Antimony** is quiet and unchanged.

**Nickel** is in fair demand at unchanged prices.

**Aluminum** continues active at former prices.

**Tin Plates** are dull and without change.

**Black Sheets** are in somewhat better demand, with prices, as a rule, unchanged.

**Galvanized Sheets** are dull and somewhat weak.

**Scrap Iron** continues active and firm.

**Foundry Iron** is very scarce, and prices are high and entirely nominal.

**Sheet Copper** continues in fair demand at unchanged prices.

**Sheet Zinc** is moderately active and firm in price.

**Hardware** is moving in good volume, with brisk demand for seasonable goods; prices rule firm.

**Cast Iron Pipe and Fittings** are very firm and in heavy demand.

**Plumbers' Brass Goods** prices have been reaffirmed.

**Sewer Pipe** is very firm and active.

**Solder** has been marked down  $\frac{1}{2}$ c. a lb. on decline in Tin.

**Stoves** have been marked up 5 per cent. in New York.

**Wire Nails** are fairly active and unchanged.

**Cut Nails** are in moderate demand and prices firm.

**Window Glass** is unsettled.

**White Lead** is active and firm.

**Linseed Oil** is weak and about  $\frac{1}{2}$ c. a gallon lower.

**Spirits Turpentine** is strong and 1c. a gallon higher.

**Sash Cord** is up  $\frac{1}{4}$ c. a lb.

## METAL MARKET.

New York, September 19, 1902.

**Pig Tin.**—The market throughout the week has been characterized by a weak and declining tendency. As compared with last week prices are about  $\frac{1}{2}$ c. lower. Business has been very light, consuming interests showing the backwardness which they have manifested for some weeks past. The fact that there is a good deal of spot Tin at present in the market also contributes to the weakness now existing. The depression in the Tin Plate industry, which has caused the closing down of a large proportion of the mill capacity has materially restricted the consumption of Tin during the last few weeks. The market closed weak. Jobbers quote Straits Pig in small lots at  $27\frac{1}{2}$ c. to 28c. per lb. Shipments from the Straits this month have been very large, amounting to 2650 tons, as against 2070 tons for the corresponding period of last year. Arrivals thus far this month amount to 2419 tons and there are 3114 tons afloat.

**Copper.**—The effects of the "boom" of last week in the Copper market have entirely passed away, and prices have declined steadily, the market now being at about the same point that it was prior to the rise. Offerings are reported to be quite urgent, while buyers are scarce. A marked weakness characterized the market at the close. Purchasing was almost exclusively of the hand to mouth order and of small quantities. Lake Ingot in small lots is quoted at about  $12\frac{1}{2}$ c. to  $12\frac{3}{4}$ c. per lb., and casing Copper  $12\frac{1}{4}$ c. to  $12\frac{3}{8}$ c.

**Sheet Copper.**—A fair demand is noted in this department, with satisfactory volume of inquiry. Prices are unchanged on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—Little change is noted in the situation of this metal. Prices are firm at the level maintained for

some time past, and rather more activity in buying has been developed in the past few days. American Pig in small lots is quoted at 4.45c. to  $4\frac{1}{2}$ c. per lb. St. Louis advices are to the effect that the Pig Lead market continues its quiet course, with no new or important features, prices continuing on the old basis.

**Spelter.**—Prices are unchanged and firm for spot metal, which is still scarce. The demand, however, is referred to as extremely light, most consumers being pretty well supplied. Jobbers quote good Western brands in small lots at  $6\frac{1}{2}$ c. to  $6\frac{3}{4}$ c. per lb. St. Louis advices report a better feeling in the Spelter market at that point, with demand and prices showing an advancing tendency.

**Sheet Zinc.**—The demand for Sheet Zinc is of the usual proportions. Prices are firm and unchanged at  $6\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and  $7\frac{1}{4}$ c. to  $7\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—No change is noted in this metal. Cookson's in small lots is selling at 10c. to  $10\frac{1}{4}$ c. per lb., Hallett's at  $8\frac{3}{4}$ c. to  $8\frac{1}{2}$ c. and U. S. at  $8\frac{1}{4}$ c. to  $8\frac{1}{2}$ c.

**Nickel.**—Is unchanged. Small lots rule at about 55c. to 60c. per lb.

**Aluminum.**—The demand for Aluminum is referred to as good and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market is dull and uninteresting, with an absence of any important buying. The retail trade also seems to have lost the snap of last week and was of quite moderate proportions. Notwithstanding the restriction of production caused by the closing down of a large proportion of the Tin Plate mills, stocks on hand seem to be more than sufficient to meet the present requirements of consumers. The fact that the canning demand is considerably below expectations accounts largely for this condition of things. The American Tin Plate Company are still quoting up to December 1 on the basis ruling for more than a year past. Jobbers' prices show no change. American Bessemer Coke Plates I C, 14 x 20, in moderate sized lots, delivered at New York or corresponding points, rule at about \$4.65 to \$4.85 per box. A decline of  $1\frac{1}{2}$  pence in the price of Welsh Plates took place this week, bringing the price down to 12 shillings  $4\frac{1}{2}$  pence, f.o.b. Swansea.

**Sheets.**—A fair demand for Black Sheets is reported this week, but Galvanized Sheets are dull, and prices somewhat demoralized. Some of the Black Sheet mills are said to be receiving more inquiries, and it is thought that the demand will show considerable improvement from now on. Taken as a whole, the current demand for Sheets is fair, and it is said that a considerable volume of business could be had if manufacturers would shade prices. This is sometimes done on especially attractive orders, but ordinarily quotations are unchanged. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots at about 3.60c., and No. 27 Galvanized Sheets is 4.45c. to 4.60c.

Chicago advices are as follows: Manufacturers report an active movement, with prices well sustained for all kinds. The jobbing demand is improving, but offerings are liberal and prices are steady as previously quoted, as follows: No. 27 Black Sheets in small lots from store are offered at 3.25c. to 3.35c., Chicago, and Galvanized Sheets are selling at 4.30c. to 4.40c. for No. 27.

**Old Metals.**—Scrap Iron is in active demand and supplies are not excessive. Consequently prices are stiff. Old Metals of other kinds are moving in fair volume with prices unchanged. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                              |                            |
|------------------------------|----------------------------|
| Heavy Copper.....            | per lb. $10\frac{1}{2}$ c. |
| Light and Tinned Copper..... | per lb. $9\frac{1}{2}$ c.  |
| Heavy Brass.....             | per lb. $8\frac{1}{2}$ c.  |
| Light Brass.....             | per lb. $6\frac{1}{2}$ c.  |
| Lead .....                   | per lb. $3\frac{3}{4}$ c.  |

|                                        |         |                  |
|----------------------------------------|---------|------------------|
| Tea Lead.....                          | per lb. | 3 c.             |
| Zinc .....                             | per lb. | 3½c.             |
| Pure Aluminum Sheet.....               | per lb. | 22 c.            |
| Cast Aluminum.....                     | per lb. | 17 c.            |
| No. 1 Pewter.....                      | per lb. | 18 c.            |
| No. 2 Pewter.....                      | per lb. | 9 c.             |
| Tin Plate, per gross ton.....          |         | \$5.00           |
| Wrought Iron Scrap, per gross ton..... |         | \$15.00 to 16.00 |
| Heavy Cast Scrap, per gross ton.....   |         | 14.00 to 14.50   |
| Stove Plate Scrap, per gross ton.....  |         | to 15.00         |
| Burnt Iron, per gross ton.....         |         | 8.50 to 9.00     |

### THE PIG IRON MARKET.

NEW YORK.—The principal event of the week has been the purchase by the largest consumer of Pig Iron in the metropolitan district of upward of 10,000 tons of American Foundry Iron for forward delivery at private terms. What business is being done for early delivery is in foreign Pig Iron, and further orders for importation have been placed by dealers. Lately there has been an advancing tendency in ocean freights, which are up about 25c. per ton from Middlesbrough. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity, No. 1 Foundry, \$23.25 to \$23.50; No. 2 Foundry, \$22.25 to \$22.50; No. 3 Foundry, \$21.50 to \$22.

CHICAGO.—The arrival of foreign Iron, with larger offerings, both for present and future deliveries, has had a steadying effect upon the market for the domestic product. One effect has been the narrower range quoted between Iron for this and next year's deliveries. A more ample supply of domestic Iron, with a less urgent demand from consumers, has also assisted the tendency referred to. The sale of an increased tonnage of both domestic and foreign Iron for deliveries extending through the first half of 1903 is noted, also more liberal sales for immediate delivery. The sales of Virginia and Tennessee Iron have been entirely Foundry grades, ranging in lots from 100 to 600 tons, delivery extending from January to June next year, on the basis of \$20.50 for No. 1, and \$20 for No. 2, Birmingham. Sales for immediate delivery have been made at \$27.65 for No. 1, and \$27.50 for No. 2. The approximate prices for delivery during the first half of next year are as follows:

|                                             |                    |
|---------------------------------------------|--------------------|
| Lake Superior Charcoal.....                 | \$26.00 to \$27.00 |
| Local Coke Foundry, No. 1.....              | 23.50 to 24.00     |
| Local Coke Foundry, No. 2.....              | 23.00 to 23.50     |
| Local Coke Foundry, No. 3.....              | 22.50 to 23.00     |
| Local Scotch, No. 1.....                    | 24.00 to 24.50     |
| Ohio Strong Softeners, No. 1.....           | 25.50 to 26.50     |
| Southern Silvery, according to Sillean..... | 23.10 to 23.50     |
| Southern Coke, No. 1.....                   | 24.15 to 24.65     |
| Southern Coke, No. 2.....                   | 23.65 to 24.15     |
| Southern Coke, No. 3.....                   | 23.15 to 23.65     |
| Southern Coke, No. 1 Soft.....              | 24.15 to 24.65     |
| Southern Coke, No. 2 Soft.....              | 23.65 to 24.15     |

PHILADELPHIA.—Foreign Iron makes the market at the present time. The supply is sufficient for existing requirements, but there is no great surplus and no pressure to make forward sales. The arrivals are taken from the vessels direct to consumers' yards, and lots afloat are mostly sold before the vessels are reported. American Irons are scarcer than ever. Small lots of No. 2 American Foundry bring about \$23.50, sometimes a little more, depending on circumstances. Makers are pretty well sold ahead, but are not disturbed that buyers are less keen to place orders than they were some time ago. The requirements of consumers are fairly well supplied by foreign Iron, and the domestic product is coming forward as well as ought to be expected, all things considered. As regards next year's business, prices for the first half remain at about \$22.50 for No. 2 Foundry, and about 50c. less for deliveries covering the entire year. Foreign Iron from alongside ship sells at \$20.50 to \$21 for Middlesbro, and Scotch brands sell at from \$22 to \$22.50.

PITTSBURGH.—Some 15,000 to 20,000 tons of foreign Bessemer Iron have been bought for consumption in the Pittsburgh district and other large lots are under negotiation. No. 2 Foundry, for shipment this year, sells at about \$22, at furnace, and \$22.75, Pittsburgh.

CINCINNATI.—No special change has occurred in the Pig Iron market since the last report. But little Iron is being sold, for the reason that little is being offered, and buyers are showing small interest in quotations, except when obliged to forage for an occasional car to piece out some requisition. It is understood that spot Iron,

while no cheaper in price, is nevertheless being offered in quantities calculated to suit very moderate wants. Iron is quotable for spot delivery on the basis of about \$22.50 for No. 2 Foundry, Birmingham, which would make it \$25.75, f.o.b. Cincinnati. There is little or no Iron to sell at this price, however. There is promise that some Southern interests will be in the market after October 1 for Iron for prompt and forward delivery. Foreign Iron has invaded this territory to a very limited extent, but it is not thought likely that much of it will be handled in the Cincinnati market. The Coke situation is strained to the last degree. We quote f.o.b. Cincinnati for 1902 delivery as follows:

|                                |                  |
|--------------------------------|------------------|
| Southern Coke, No. 1.....      | to \$26.25       |
| Southern Coke, No. 2.....      | to 25.75         |
| Southern Coke, No. 3.....      | \$23.50 to 24.50 |
| Southern Coke, No. 4.....      | 21.25 to 22.00   |
| Southern Coke, No. 1 Soft..... | to 26.25         |
| Southern Coke, No. 2 Soft..... | to 25.75         |

### CHICAGO REPORT.

Scrap Iron and Steel.—The market has continued to gather strength under moderate receipts and a good demand from consumers. The tendency of buying prices is upward, and should present conditions hold a further revision of prices will be necessary. The following are the prices paid by dealers in carload lots, Chicago:

|                                                        | Per net ton.       |
|--------------------------------------------------------|--------------------|
| Country Wrought Scrap.....                             | \$16.00 to \$16.50 |
| Machinery Cast.....                                    | 14.50 to 15.00     |
| Malleable Cast.....                                    | 13.00 to 14.00     |
| Stove Plate (free from burnt).....                     | 11.00 to 12.00     |
| Burnt Iron and Grate Bars.....                         | 9.50 to 10.00      |
| Sheet Iron and Hoops.....                              | 10.00 to 10.50     |
| Plow Steel.....                                        | 13.00 to 13.50     |
| Breaking Stock.....                                    | 12.50 to 13.00     |
| Old Boilers—whole (Iron).....                          | 9.50 to 10.00      |
| Old Boilers (Iron) cut in single Sheets and Rings..... | 14.00 to 15.00     |
| Old Gas Pipe and Boiler Tubes.....                     | 13.50 to 14.00     |
| Cast Borings.....                                      | 9.00 to 9.50       |
| Turnings.....                                          | 12.50 to 13.00     |
| Horseshoes.....                                        | 13.50 to 14.00     |

Old Metals.—The advance in Copper and Brass noted a week ago has been well sustained, but the market has been quiet and no further changes are in sight. Zinc and lead continue firm with an upward tendency. The offerings to dealers are only moderate and buying prices in this market are as follows:

|                            | Per lb. |
|----------------------------|---------|
| Copper Wire and Heavy..... | 10½c.   |
| Copper Bottoms.....        | 9½c.    |
| Copper Clips.....          | 10½c.   |
| Red Brass.....             | 10½c.   |
| Yellow Brass.....          | 7½c.    |
| Red Brass Borings.....     | 9½c.    |
| Yellow Brass Borings.....  | 7½c.    |
| Light Brass.....           | 6½c.    |
| Pipe Lead.....             | 3.70c.  |
| Tea Lead.....              | 3.35c.  |
| Zinc.....                  | 3.45c.  |
| Tin Foli.....              | 21 c.   |
| Pewter, No. 1.....         | 18 c.   |
| Pewter, No. 2.....         | 11 c.   |
| Aluminum.....              | 20 c.   |

Old Rubber.—There has been a further hardening of the market with Air Brake Hose higher. Receipts have been on a moderate scale and there is a fair outlet to dealers, who are paying the following prices, Chicago:

|                            | Per net ton. | Per lb. |
|----------------------------|--------------|---------|
| Garden Hose.....           | \$25.00      | .....   |
| Air Brake Hose.....        | 50.00        | .....   |
| Rubber Shoes.....          | .....        | 7 c.    |
| Rubber Car Springs.....    | .....        | 5 c.    |
| Inside Bicycle Tubing..... | .....        | 22 c.   |
| Outside Tubing.....        | .....        | 5 c.    |
| Black Rubber.....          | .....        | 4 c.    |
| White Rubber.....          | .....        | 8½c.    |

Rags.—The market has continued firm in tone, with moderate receipts and a fair outlet. Dealers continue to buy Country Mixed Rags at 75c. to 85c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The little Anthracite Coal available has been sold during the week as high as \$12 a ton on track. The demand, of course, is urgent, but it is almost impossible to give any reliable facts concerning the market. Mine operators and wholesale dealers in this section have no information respecting the probable outcome of the future.

THE P. P. EMORY MFG. COMPANY, Springfield, Mass., coppersmiths, brass founders and machinists, will erect a new plant, 50 x 120 feet, in the rear of their present building. Plans of construction are not yet completed and but little additional machinery will be required.

## THE HARDWARE TRADE.

With the advance of the season and touches of cold weather, giving intimations of the coming winter, there is a decided quickening in the demand for fall and winter goods, and this carries with it a general increase in the volume of business. Orders from the jobbing trade are reported by manufacturers as coming in more freely, but many of them are awaiting receipt of goods purchased some time ago, while there is a good deal of correspondence in regard to delayed shipments, as jobbers are urging the execution of their orders. Stocks in their hands seem in most cases to be sufficient to meet present requirements, but as a result of the steady drain made upon them are likely to be exhausted in some lines before the season is over. Holiday and fancy goods are moving in more than the usual quantities, reflecting the tendency on the part of the trade to broaden out on many lines as well as the general prosperity of the people, which makes a good demand for this class of articles. The difficulty of obtaining raw material still embarrasses manufacturers in many branches. With the full employment of skilled labor, and in many sections a scarcity, manufacturers are not in a position to dispute any reasonable demands for increased wages. The production of the country is keeping up its tremendous pace and the spirit of enterprise which dominates is adding constantly to manufacturing facilities in practically all departments. Competition in lines which have been in large measure controlled by combinations or consolidations is on the whole evidently growing, and the outside manufacturers in an enlarging number of fields have to be reckoned with. Negotiations, with a view to effecting further consolidations in several lines, are in progress, and it is evident that the tendency in this direction has not yet exhausted itself.

## NOTES ON PRICES

**Cast Iron Soil Pipe and Fittings.**—The market for Cast Iron Soil Pipe and Fittings has stiffened up considerably within the past week, and the indications at the present time are that within the next ten days an advance in the prices will be announced. The manufacturers will hold a meeting in New York City during the coming week, and as it is the annual meeting a full attendance of the association members will be present. The demand for Pipe is extraordinary for this time of the year, and manufacturers have labored under many disadvantages owing to the coal situation and the scarcity of raw Iron. No opposition of any importance has developed during the past year and no serious opposition is now in sight. It is rumored that two of the large jobbing houses in New York are proposing to join forces and go in the Pipe and Fittings business to supply the needs of the jobbing branch. If this is so, it will take some time, however, before the proposed concern could affect the market and it would be at least one year before there was sufficient opposition to warrant the members of the association throwing the entire market over.

**Plumbers' Brass Work.**—The manufacturers of Plumbers' Brass Work held a meeting in New York City on the 11th inst., and as a result of the deliberations it was decided that no change would take place in the then ruling prices. The matters of credits, freight regulations and factory and foundry interests were discussed, but these were of interest only to the members of the association and have no bearing whatever upon market conditions. The probability is that prices will remain as they are until the first of the year, when efforts may be made to get several of the independent manufacturers again into the association.

**Sewer Pipe.**—Owing to the amount of building and improvements going on throughout the country, the season has been a very satisfactory one to manufacturers of Sewer Pipe. The demand has been so large that grading a portion of their output as second quality Pipe, for which a reduction in the regular price was made, has been discontinued by some of the manufacturers, but some is still found in the market. The following discounts, such as are given to jobbers, apply to the list

adopted December 19, 1901, and cover standard Pipe and Fittings, 2 to 24 inches in size. Carload lots are generally delivered:

### Sewer Pipe.

|                                               | Discount. |
|-----------------------------------------------|-----------|
| New England.....                              | 70 %      |
| New York and New Jersey.....                  | 73 %      |
| Maryland, Delaware and East Pennsylvania..... | 75 %      |
| West Pennsylvania and West Virginia.....      | 76 %      |
| Virginia .....                                | 78 %      |
| Ohio, Michigan and Kentucky.....              | 78 %      |

**J. C. Paul & Co.**—J. C. Paul & Co., 59 Dearborn street, Chicago, make the following quotations to the trade on their line of Polishes:

### Burnishine, Liquid.

|                        |                            |
|------------------------|----------------------------|
| ½ pint, per doz.....   | \$1.25; per gross, \$12.00 |
| 1 pint, per doz.....   | 2.00; per gross, 19.20     |
| 1 quart, per doz.....  | 3.50; per gross, 33.60     |
| 1 gallon, per doz..... | 9.00                       |

### Burnishine, in Paste Form.

|                         |                        |
|-------------------------|------------------------|
| 3-oz. box, per doz..... | .50; per gross, \$4.50 |
| ½-lb. box, per doz..... | \$1.25                 |
| 1-lb. box, per doz..... | 2.00                   |

### Putz Pomade.

|                         |                        |
|-------------------------|------------------------|
| 3-oz. box, per doz..... | .50; per gross, \$4.50 |
| ½-lb. box, per doz..... | \$1.25                 |
| 1-lb. box, per doz..... | 2.00                   |

### Pride of the Bar Metal Polish.

|                          |                            |
|--------------------------|----------------------------|
| 1-lb. box, per doz.....  | \$1.25; per gross, \$12.00 |
| 4-lb. box, per doz.....  | 3.00                       |
| 12-lb. box, per doz..... | 9.00                       |

**Solder.**—The downward course of the Tin market has caused a decline in the price of Solder. Jobbers are now quoting Half and Half, Guaranteed Solder at 18½ to 19 cents, and No. 1 at 16 to 17½ cents per pound in small quantities.

**Stoves.**—The manufacturers of Stoves selling in the New York market, at a meeting on September 18, advanced the price on all classes of Stoves 5 per cent.

**Wire Nails.**—Small lots of Wire Nails from store are moving in fair quantities. There is an increase in inquiries and orders for carloads. Small lots from store are quoted at \$2.25 to \$2.30, New York.

**Cut Nails.**—There continues to be a scarcity of Cut Nails, particularly in those made from Iron. The demand continues moderate and prices firm, small lots from store, New York, ruling at \$2.30 per keg.

**Glass.**—The Window Glass situation is still in a complicated condition. The Independent Glass Company failed, at their recent meeting, to come to any decision as to their future policy, and another meeting is to be held in a few days, when a decision will, it is expected, be arrived at. The meeting of the National Window Glass Jobbers' Association and of the combined Window Glass manufacturers will be held soon after the meeting of the Independent Glass Company. The Jobbers' Association quotations on Single and Double Strength Glass continue at 88 and 5 per cent. discount for Glass from store.

**White Lead.**—The market for Lead products is active, and the demand for White Lead in Oil is increasing. The outlook is favorable for the use of a large quantity during the fall months. White Lead in Oil from store is sold in moderate sized lots at 6½ to 6¾ cents.

**Linseed Oil.**—The market lacks stability, and the reduction in price on September 8 by manufacturers has created the impression among consumers that prices are likely to go still lower; consequently, they have been holding out of the market to a great extent, although the demand for small lots of Oil is of fair volume. Jobbers quote City Raw in small lots at about 57½ to 58 cents per gallon. The receipts of new Seed exceed those of the corresponding time last year.

**Spirits Turpentine.**—The Turpentine market has strengthened during the week about 1 cent per gallon. Turpentine in small quantities is now quoted at 49 to 49½ cents per gallon. The Southern market is very strong, with a good business reported. During the past season production has been somewhat restricted. Supplies at this point, it is understood, are largely in the hands of one concern, which strengthens the local market.

**Sash Cord.**—The manufacturers of Cotton Sash Cord

have advanced the price of this material  $\frac{1}{4}$  cent a pound.

**Barrett Mfg. Company.**—Under date of September 13 the Barrett Mfg. Company, Chicago, have issued to the trade a new price-list of their Building Papers, Prepared Roofing and Paving Pitch, Tarred Felts and Coal Tar Products.

**The Norton Iron Works,** Ashland, Ky., under date of September 12 announce that they are prepared to ship mixed carloads of their products, including Cut Nails, Wire Nails, Annealed Wire, Galvanized Wire, Cable Wire, Barbed Wire and Staples, at carload prices.

**Central Linseed Oil Company.**—Under date of September 9 the Central Linseed Oil Company, Cleveland, Ohio, sent out a special offer to the trade quoting on all orders for Linseed Oil to be shipped until October 1 at the following prices: Raw Linseed Oil, 54 cents per gallon; Boiled Linseed Oil, 56 cents per gallon, in barrels delivered at the consumers' railroad station. Terms, 30 days, or 2 per cent. discount for cash in ten days.

## TRADE NOTES.

**THE C. C. HOVEY SUPPLY COMPANY,** Bainbridge, N. Y., have been incorporated with a capital stock of \$25,000 to manufacture Tinware and kindred articles.

**THE ORMSBY DUST PAN COMPANY** of Holland, N. Y., have been organized to manufacture a patent Dust Pan invented by John H. Ormsby.

**THE SPRAY WASHING MACHINE & MFG. COMPANY** of Baltimore, Md., have been incorporated with a capital stock of \$50,000 to manufacture Washing Machines and other household articles. H. S. Sohl, W. H. Waddell, W. H. Radcliffe, G. P. Hopkins and H. S. Abendschein are the incorporators.

**JOSEPH HUSE & SON,** 91 Blackstone street, Boston, Mass., have made some changes in the sizes of Sheet Mica used to make up the assortment which they sell for \$5. The sizes are larger than ever before and are those found to be the most salable. The assortment contains 2 pounds and eight sizes, as follows: 2 x 3, 3 x 5 $\frac{1}{2}$ , 1 $\frac{1}{2}$  x 3, 3 x 6 $\frac{1}{2}$ , 4 x 5 $\frac{1}{2}$ , 2 x 5, 4 $\frac{1}{2}$  x 4 $\frac{1}{2}$ , 5 x 5, and there is  $\frac{1}{4}$  pound of each. The quality of Mica is said to be absolutely first class, and is placed in an attractive tin case used for show purposes, which case is sent free.

**G. MATHES' SONS RAG COMPANY,** St. Louis, Mo., dealers in Scrap Iron, Machinery, Metals, Rags and Old Rubber, have recently purchased the property at Broadway, Second and Branch streets, covering an area 400 x 250 feet, and will carry on the Scrap Iron business on a large scale. The company have their own track facilities and are equipped to take care of all the business offered. Their offices and warehouse are at 3120-3130 North Broadway.

The variety of unique advertising cards prepared and sent out by the Grasselli Chemical Company, Cleveland, Ohio, in the interest of their Eureka Soldering Flux, seems to be unlimited. Two new ones that have reached us this week are very striking in design, coloring and general get up and cannot fail to attract the interest and attention of the recipient.

**THE Rod mill** which the Coe Brass Mfg. Company, Ansonia, Conn., purchased some time ago is being rebuilt and put in the same excellent condition as the other departments of the company.

**THE GLASBRITE COMPANY,** 1327 Williamson Building, Cleveland, Ohio, are offering a paste in tin cans for cleaning windows, enameled ware, glass china, crockery, solid silver, nickel and plated surfaces, cut glass, jewelry, marble, &c. Cleaning does not depend upon friction, it is explained, because there is no grit in Glasbrite; also there is no soap in the composition and it does not leave streaks. It is not a scouring substance it is remarked, and is applied with a damp cloth and then rubbed off, leaving the article with its original brilliancy.

**THE D. M. STEWARD MFG. COMPANY** of Chattanooga, Tenn., are introducing a new Crayon for marking on iron. It is of unusual size and in the form of a square stick 1 inch by 5 inches long. The mark it makes is an almost pure white. It is very strong and durable.

**BURCE & COOK,** jobbers and dealers in Tin Plate, Metals and Timmers' and Roofers' Supplies, 186 to 190 Water street, New York, are distributing a list of the stocks of Apollo B. B. Galvanized and Corrugated Steel Sheets, Galvanized Iron Sheets, Wood's Refined Sheets, Soft Steel Sheets, Genuine Russia Iron, American Planished Iron and Polished Steel Sheets; also American Roofing Plates, Cycle Continuous Roofing and Bright Tin Plates of all grades. Special attention is called to the firm's Solder, which they manufacture in several varieties, and a complete list is presented of Timmers' and Roofers' Supplies, Tools and Machines.

**THE E. P. GLEASON MFG. COMPANY,** 181-189 Nassau street, New York, have issued Catalogue S, devoted to Illuminating and Heating Burners, Brackets, Fittings and miscellaneous goods.

The second annual meeting of the American Aluminum Association was held at the Hotel Henry, Pittsburgh, Pa., on Friday, September 19. Among the subjects discussed by the delegates were the extent of the present aluminum industry, its future and the steps that can be taken to eliminate unreasonable competition in the trade. The Pittsburgh Reduction Company arranged to take the delegates to the convention on a visit to one of the principal steel works in Pittsburgh and also entertained the association at a dinner.

The most reliable authorities place the cotton crop of the United States for the current year at about 10,700,000 bales, as compared with 10,425,000 bales in 1901 and 9,440,000 bales in 1900.

## TO THE PROGRESSIVE STEAM FITTER.

A small outlay will bring in large returns by purchasing exclusive territory in which to handle the Improved Regulating Radiator, for steam heating, covered by patents. All additional pieces required by the patent can be picked up and applied in any steam fitter's shop, to any good modern radiator. Heats quicker and better than the old style and heats just as you want it. Prices for territory very reasonable. The right for a good size county, containing 100,000 inhabitants can be purchased for \$100. Smaller or larger counties at corresponding prices.

Apply to

AUGUSTUS EICHHORN,  
26 Essex Ave., Orange, N. J.

## DOMESTIC ELECTRICAL WORK.

Concise and Practical Explanations for Plumbers, Tanners and Hardware  
Dealers on How to Wire Buildings for Bells, Alarms, An-  
nunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.  
BY WILLIAM A. WITTBECKER.

Price, in Paper, 25 Cents. Price, in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses,  
offices and workshops, and the need of plain instructions whereby any per-  
son without a previous knowledge of electricity may be enabled to under-  
take their successful installation, has prompted the publication of this  
little book. It is not intended for the amateur who seeks for nothing but  
experimental work, neither is it expected to enlighten the expert electrician;  
but to the person who is seeking for information that will assist him in  
increasing his daily earnings this little volume is addressed.

SENT POST-PAID ON RECEIPT OF PRICE BY

 79 PEARL ST., NEW YORK

—DELIGHTED AT THE THOUGHT.—  
 "Well, good night," said Mr. Borem, finally breaking away. "I've had a most enjoyable evening. Er—by the way, I expect to pass your house to-morrow evening and I thought I might—"  
 "I'll be delighted," said she quickly.  
 "Good night."—Philadelphia Press.

### THE NEW METAL WORKER PATTERN BOOK.

A Course in  
Pattern  
Cutting as  
Applied to  
all Branches  
of Sheet  
Metal Work

Is set forth in The New Metal Worker Pattern Book. This fine work is recognized as the only complete exposition of the subject. It is adapted to the wants of both the beginner and of the more experienced pattern cutter, beginning with ample instructions in drawing, geometry, the principles of pattern cutting, etc. (all in relation to sheet metal work), and finally demonstrating 218 problems, which include every example of work ordinarily met with in pattern cutting.

Every student should have The New Metal Worker Pattern Book, and no tin or cornice shop is properly equipped without it.

430 pages; 744 illustrations; size, 10 x 13 in.; price \$5.00.

# DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

**STEEL & IRON ALUMINUM COATING CO.,  
CONNELLSVILLE, PA.**

The first Iron bodied Roofing Plate used in this country since the introduction of Steel as a foundation for Roofing Tin bore the stamp in the centre of the inner circle. We introduced this Iron Plate, and all of the many so-called Iron Plates bearing other brands are but imitations of the original sold by us for the last ten years. The stamp serves two purposes—it secures the customer against all chances of fraud, as no tin without this stamp is the genuine, and it acts as a guarantee of quality. Ours is the only Iron Roofing Tin made

**MEURER**

**MEURER'S GENUINE  
TINNED  
IRON SHEETS  
I C**

on a body of **Pure Charcoal Iron**—all others are made of inferior grades of iron and consequently will not stand the test of time that ours will. The Meurer Genuine Tinned Iron Sheets are made in England in the same way as they have been manufactured for 100 years and are the same identically as were the plates laid half a century ago by the old time roofers, which are to be found to-day on roofs all over the country in as good condition as ever. We will gladly furnish samples and all information desired.

DISTRICT SALES OFFICE, MARQUETTE BUILDING, CHICAGO

This  trade mark is stamped on every sheet of the best roofing tin made. This  mark means "Most Favored," because this brand is most favored by architects, dealers, and builders everywhere. MF Roofing Tin was first made in Wales 50 years ago—later the process was improved in America—and the product developed, until now MF Roofing Tin is more in demand than any other brand. The superior quality of MF Roofing Tin is attested by the first prize awarded it at the Paris Exposition, 1900, where it was in competition with all the world.

The entire tinning process is effected by skilled hand labor, without the use of acids or rolls. The very best plates, a great amount of pure tin and new lead, the utmost care in manufacture, successively contribute to making MF the best of all roofing. It is most economical, because it lasts longest—many roofs made of MF 50 years ago are sound as ever today. MF Roofing Tin is sold by dealers everywhere. Specify it in your building estimates. Ask your roofer,

or write to W. C. CRONMEYER, Agent, Carnegie Building, Pittsburg and receive illustrated book on roofing.

## ROOFING, CORNICE & SKYLIGHT MANUAL

describes and illustrates accurately the laying of flat and standing seam roofing, country cornice shop practice, including shop equipment and cornice making, and the design and construction of skylights. The following are some of the subjects treated upon:

### TIN ROOFING.

An article prepared specially for this book.

### Equipment and Methods

THE ROOFING BENCH.  
PUTTING THE TIN TOGETHER.  
SOLDERING.  
FLAT SEAM ROOFING IN STRIPS.

### Flat Seam Roofing

NOTCHING AND EDGING.  
HAND TOOLS, FIRE POTS AND SUPPLIES.  
THE USE OF CLEATS.  
ROUSING SEAMS, SOLDERING AND COPPERS.  
VALLEYS AND GUTTERS.  
CONNECTING ROOF TO WALL FLASHING.  
FINISHING AROUND SKYLIGHTS AND SCUTTLES.  
COVERING THE SIDES AND TOPS OF BULKHEAD.  
FLASHING PARAPET WALL.  
SOLDERING UPRIGHT SEAMS.

### Standing Seam Roofing

EDGING THE STRIPS.  
CLEATS FOR HOLDING THE STRIPS.  
FINISHING STANDING SEAMS AT GUTTER.  
CONNECTING FLASHING WITH ROOF.  
MAKING A MITERED STANDING RIDGE SEAM.  
STEP FLASHING.

### Flashings for Slate or Shingle Roofs

WALL FLASHING.  
SHINGLE FLASHING.  
PUTTING IN A VALLEY.  
FLASHING AROUND A CHIMNEY.

### Table of Quantity of Tin for Roofs

#### "THE COUNTRY CORNICE SHOP."

Reproduced from *The Metal Worker*.

FITTING UP SHOP.  
RIDGE AND GUTTER FORMER AND BENCH TOOLS.  
DRAWING INSTRUMENTS.  
LEADER ELBOWS.  
SQUARE RETURN EAVE TROUGH MITER.  
GUTTER SPOUTS.  
MAKING EAVE TROUGHS.  
OPERATING THE CORNICE BRAKE.  
PATTERN OF MOLDED EAVE TROUGH.  
EAVE OR SNOW GUARD GUTTERS.  
CONNECTING GUTTER TO LEADER.  
OBTAINING THE DIFFERENT LENGTHS OF BRACES.  
SHORT RULES.  
MOLDED GUTTERS ON BRICK WALLS.  
FULL SIZE PATTERNS.  
PUTTING UP THE GUTTER.  
TAKING MEASUREMENTS AND MAKING PATTERNS.  
LEADER PIPES AND FASTENINGS.  
BENDING SQUARE LEADER.  
A HOME-MADE HATCHET STAKE.  
LEADER HOOKS AND COVERINGS.  
CONCEALED HANGERS.  
PATTERNS FOR COVERINGS.  
PATTERNS FOR BRANCHES AND JOINTS.  
PATTERNS FOR T-JOINTS.  
FLARING COLLARS FOR ROUND, SQUARE AND OCTAGON PIPES.

### SKYLIGHT CONSTRUCTION.

Consisting of two Competition Prize Essays reproduced from *The Metal Worker*.

#### First-Prize Essay

GROUND PLAN AND ELEVATION OF SKYLIGHT.  
SECTIONAL VIEWS, FULL SIZE, OF THE CURB AND BARS USED.  
PLAN OF TOP MITERS.  
DEVELOPMENT OF CURB AND RIDGE MITERS.  
PATTERN OF SIDE BAR C.  
DEVELOPMENT OF HIP BAR AND MITERS.  
PATTERN OF HIP BAR.  
TOP MITERS FOR D AND F BARS.  
TOP MITER FOR THE E BAR.  
DEVELOPMENT OF CAP MITERS.

#### Second-Prize Essay

MAKING A SKYLIGHT.  
FINDING LENGTH OF BARS.  
LAYING OUT PATTERN FOR CURB.  
PATTERN FOR COMMON BAR.  
PATTERN FOR VENTILATOR.  
PROFILE OF HIP BAR.  
PATTERN FOR HIP BAR.  
PATTERN FOR JACK BARS.

175 Pages, 170 Illustrations, 13 Plates.

Price \$1.50, postpaid.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the  
mechanic and a profitable operation for the employer. With them  
a man can cut No. 12 steel with one hand on the lever, leaving  
the other hand free to guide the stock while cutting elbows,  
ties and circles, as small as 8 inch radius; this is done without burring or  
buckling either piece, thus avoiding hammering and straightening, which  
add to the cost of the product. They split sheets of any width or length  
up to No. 12 gauge, cut wire or bar-  
steel  $\frac{1}{8}$  inch thick, cut off and mitre  
angle iron  $\frac{1}{8}$  inch thick, and do it  
perfectly.

## AMERICAN STEAM and ALTITUDE GAUGES, POP SAFETY VALVES.

Heating Specialties. American Steam Gauge & Valve Mfg. Co., Bismark St., Boston, Mass., U. S. A.

IT pains us to see makers of hot water and steam boilers say all sorts of nasty things about heating by hot air furnaces. Furnace heating will continue to be very popular for a great many years to come, and the dealer who is well posted on all systems of heating and sells his customer what he really needs is the dealer who will make money. We make hot water and steam boilers, as well as hot air furnaces, and we are not prejudiced to any system. We want our dealers to sell their customers what they need.

# ROUND OAK

## Standard of America

There's a coal bin  
in the cellar  
of a fine residence  
on one of the avenues  
on the south side  
in Chicago  
that contains today  
all ready for winter  
twenty-four tons  
of "egg" hard coal.  
This is the amount  
they have used  
every winter  
to keep about  
"three-quarters warm"—  
"some days  
in the winter  
they couldn't do that."

The old furnace  
has given up the struggle  
after but few years  
and we propose  
with the  
Round Oak air tight furnace  
and Round Oak methods  
to keep them wholly warm  
and use about  
one-half that coal.  
We would like to hear  
from furnace men  
who are genuinely enthusiastic  
about high class furnace work.

# Crawford

## Cooking-Ranges

That single damper we were telling about is a good deal better thing than we thought at first. So many cooks have spoiled their dough by not understanding dampers that the housekeeper takes to the single damper right away.

WE HAVE A LITTLE BOOK ON DAMPERS WHICH WE ARE GIVING AWAY. ✂✂ Have You Seen It?

### Dampers

This book tells about dampers of cooking-ranges

Then there are the "take-off" nickel bands, the common-sense dockash grate, and the usual arguments besides.

### SOME OTHER GOOD ONES

This year's Crawford Oak has a removable skirt, which is easily lifted off when blacking the stove or cleaning the nickel-work. This new feature pleases housekeepers, and makes this Oak an easy seller. ✂✂ The "Cosy Crawford" is a divided-back pipe surface burner, well made, very stylish and attractive.

## CRAWFORD BOILER

for Steam: for Water

This new heater has a deep firepot, triangular grates easily removed, a large one-piece ashpit, corrugated internal surfaces, and malleable push-nipples. ✂✂✂✂✂

Capacities are on our "honest-rating" plan. The prices are low. This heater is being used by some of the best people in the business. ✂✂ Sizes 22, 25, 28 now ready.

# The Cooper Oven Thermometer

The First, Best and only thermometer ever used on stove oven doors which is of any real value to those who do baking. This is no loose advertising talk, but statements easily verified by facts.

FULL SIZED CUT OF DIAL.

Many of them have been in constant use thirteen years, and many thousands of them from eight to ten years. Used by over forty manufacturers of the highest grade ranges in the U. S. and Canada.

Since the use of the Cooper Thermometer has shown the necessity for such an instrument on oven doors, within the past five or six years there have been some half dozen devices put on the market called oven thermometers.

They do not deserve to be so-called.

Their bad working is depopularizing the name of oven thermometer with the public, who do not understand the difference between them and a good one.

Fortunately, unlike a watch, their value can easily be known by their faces.

Twenty degrees difference in the temperature of an oven, is sufficient to make "good luck," or "bad luck" in baking many kinds of food.

Unless an oven thermometer will plainly indicate such change, by a movement of the hand sufficient to be easily seen, such thermometer is positively worthless, by which to regulate the fire and heat of the oven. An attempt to use them for that purpose only produces disappointment and disgust, more or less of which attaches to the stove on which they are used. Between normal temperature, and extreme baking heat, there is a difference of 325 to 400 degrees. If for such a change of temperature, the whole movement of the hand of an oven thermometer is only two or three inches, it is plain that with a change of 20-30 or even 40 degrees, the movement of the hand would be too slight to be noticed by those who usually do baking, at least without a magnifying glass, which is not commonly used in a kitchen. The hand on the Cooper thermometer moves over six inches with such change of temperature, plainly shows a difference of 8 or 10 degrees in the heat of the oven, and even 2 degrees can easily be seen, by a slight knock on the oven door.

Next to good working durability is the most valuable quality in an oven thermometer. Thirteen years of satisfactory working is a very good record for the Cooper thermometer. Not being obliged to increase the radius of the hand in order to give it sufficient movement to be noticed, the dial on the Cooper thermometer is only as large as is necessary to be plainly seen by those using it, thereby making the danger of breaking much less than if it had a larger diameter. Those who use them do not say they "Do not think an oven thermometer amounts to much, anyway." The most common expressions of those who use the Cooper thermometer, is "I would not try to keep house without my oven thermometer," or "I don't know how I ever got along without it."

It is easily adjusted to either a swing or drop door, and is the best selling point ever put on a stove or range. However highly it is praised by the seller, it is more than verified when used. Do not buy a worthless article because it can be bought for a few cents less. It is sure to be far more costly in the end. An honest tile is preferable to a "make-believe" oven thermometer.

The price of the Cooper thermometer is very low indeed, when cost and value are considered.

Every thermometer carefully adjusted, and tested by heat, before sending out.

## THE NEAREST WAY

to your customer's heart is through his coal bin. The average man worries about his winter coal bill all through the year.

Every man who is furnace hunting has two objects in view:

To buy the furnace that consumes the least coal.

To buy the furnace that gives the most comfort in his rooms.

Every dealer will assure him that this furnace or that furnace will meet these demands. He realizes he must take somebody's word for it. He can't satisfy himself by looking at a furnace. He must buy it and then abide by the consequences.

There is a different furnace. It is the Peck-Williamson Underfeed Furnace. It shows in itself what it is. You can point out, and prove beyond a doubt, to your customer the pure and simple reasons why this furnace burns less coal and gives greater heat—

### More Heat at One-Half or One-Third the Coal Cost.

In this furnace the combustion is not forced in the slightest. The coal is fed from underneath. The fire eats down into it, consuming the heat generating properties of the coal as fast as they are liberated. This heat is retarded by the upper layer of incandescent fuel. Every atom of coal, therefore, does its full share toward heating the air that goes into the rooms instead of out, through the chimney, into the blue sky.

By the same principle the smoke nuisance is entirely done away with and the coal lasts longer.

You can prove these things to any thinking man. He can see these things with his own eyes. It is a money-saving and a comfort-dispensing furnace which has no equal.

A slight movement or two of the lever is all that is needed to feed in the fresh coal.

You should have our attractive booklet. You can't afford not to read it any more than you can afford to let your competitor sell the Peck-Williamson Underfeed Furnace.

We've another book. It's about the **Peck-Williamson Laundry Dryer**. Ask for it, too.

**The Peck-Williamson Company**  
CINCINNATI.

will do all that any will do, and a whole lot that some won't. Smith & Thayer Company,  
Manufacturers, Boston, Mass; 105 Beekman Street, New York.

**HEATER.**

OLD LYME, CONN., January 15, 1902.

DIGHTON FURNACE CO., Taunton, Mass.

Gentlemen:—I suppose it is time something was said about the "Dighton" Furnace you put in the church at old Lyme.

I am the janitor of the church, and I must say your furnace is giving great satisfaction and I have no trouble in heating the building. We have had some cold Sundays since the furnace was put in, but I was able to keep the temperature over 70° without putting on any draft or pushing the furnace any at all. I must say it is one of the best furnaces I ever saw. It combines simpleness, cleanliness and efficiency, which I think cannot be equaled by any other at present.

If I wanted to go into details about it, I could tell you some of the things it has done, but I will relate one. One Saturday night I did not put on a large fire, but just enough, I thought, to keep it going until morning. During the night a change came and in the morning the wind was blowing a gale from the north, with the temperature 6° above zero.

I got to the church at 8 o'clock and found the fire dead out and the church temperature just 34°. I dumped the fire and started a new fire and put on full draft, and by 11 o'clock, when service commenced, the temperature was 68°, and by 12 o'clock I had to open the doors.

If this is any use to you as a testimonial, do not hesitate to use it.

Yours respectfully,

JOHN KANE,

Sexton Old Lyme Church.

Established 1850.

# Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnerns and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

## PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

**Chapter I.—Furnaces**—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

**Chapter II.—House Heating**—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

**Chapter III.—The Combination System**—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

**Chapter IV.—Air**—Deals with the Necessity of Ventilation—Water Needed to Moisturize Air—Expansion of Air—Velocity of Air in Tubes, etc.

**Chapter V.—Heating and Ventilation of Buildings**—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

**Chapter VI.—Heating of Public Buildings Churches and Stores**—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

**Chapter VII.—Fan-Furnace Combination System**—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

**Chapter VIII.—Temperature Control.**

**Chapter IX.—Estimate and Contract Blanks.**

**Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.**

## APPENDIX.

**Furnace Fittings.**—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

CLEVELAND, O.

## Common Sense Circulator and Radiator.

(Patent applied for.)

This Heater is so simple that its superiority over all others is plain. Being open at each end the cold air is taken in at the bottom, passing out at the top heated; producing a circulation unequalled by any radiator. Is easily cleaned or repaired. Takes the place of a joint of pipe. Diameter of casings, 10½ and 12½ inches. Send for prices.

A. C. SELLECK,  
755-757 W. Madison St., CHICAGO, ILL.

BURTON'S

## Fuel Economizer

Attached to stove pipe, saves more fuel and radiates more heat than any other device....

NO TROUBLESOME TUBES.

W. J. BURTON & CO., Mfrs.  
Detroit, Mich.

**A** TOMS of heat make degrees of temperature in a house. Every degree of temperature conserved by the utilization of heretofore wasted heat means added weight to the side of economy on the balance of expenses. The cause which produces these effects is the COLUMBIA RADIATOR.

A radiator which utilizes the most heat, which is neat and compact and which is so constructed as to be most easily cleaned, is sure to prove the quickest, readiest seller. We call your attention to the vertical system of tubes in the COLUMBIA which assures direct radiation, even distribution of heat and added facilities for ventilation, and which also assures the simplest, easiest method of cleaning.

We solicit your correspondence, knowing that offering you as we do a superior article at a price which places us in a class alone, when you place your order the COLUMBIA will command your attention. We do not offer an untried article, but one which has stood the test and proven itself a marketable product.

## A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on  
*Chimney Troubles and Their Remedies*  
published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house, chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

### The Contents are as follows

|                                                                                                                                                                                                                                                             | Page.  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| POINTS ON CHIMNEYS                                                                                                                                                                                                                                          | 7-32   |
| An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done. |        |
| DEFECTIVE FLUES                                                                                                                                                                                                                                             | 33-35  |
| This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.                                                                                         |        |
| HOW TO IMPROVE A WEAK CHIMNEY                                                                                                                                                                                                                               | 36-40  |
| VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS                                                                                                                                                                                                                | 41-45  |
| CONDENSATION IN STOVE PIPES                                                                                                                                                                                                                                 | 46, 47 |

# The YANKEE Hot Air DAMPER (IMPROVED.)

HOT AIR.

THE YANKEE EXCELS.

SMOKE PIPE.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market.

It is impossible for this rod when in position to move either way.

**ROD POINTS:** Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of  $\frac{1}{4}$  in. cold-rolled steel and slips into damper very smoothly. Sample sent to any Dealer without charge.

# Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5 $\frac{3}{4}$  x 8 inches, Cloth, Price, \$1.00.

This is a concise and practical manual on the *best methods of doing gas fitting*.

It fills a need experienced by American mechanics for a handbook giving *plain and simple instructions* in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

## TABLE OF CONTENTS.

### FIRST ARTICLE.

Introductory,  
The Distillation or Manufacture of Coal Gas,  
The Distribution of Gas from the Gas Holder Through the Town,  
Connecting the Meter in Buildings,  
Inspection of Material and Work,  
Laying Out Pipe,  
Gas Fitters' Tools,  
Piping the Building,  
Measuring Pipes,  
Cutting the Pipe,  
Finding Leaks,  
Putting Up Fixtures,  
Gas Logs,  
Economical Gas Burning.

### SECOND ARTICLE.

Introductory,  
Locating the Lights,  
Locating the Meter,  
Making the Plan,  
Getting Out the Pipe,  
Piping the House,  
Gas Fixtures and Fittings,  
Piping Old Houses,  
Frozen Gas Pipes.

## ABOUT ESTIMATE BOOKS

For Plumbers and  
Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.

W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.

W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.

CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "CONTRACT AND ESTIMATE RECORD BOOKS" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

### CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

#### OFFICE EDITION.

200 Pages. Arranged for 100 Estimates.  
Size 8 x 11 inches. Cloth bound, \$1.50  
500 Pages. Arranged for 250 Estimates.  
Size 8 x 11 inches. Cloth bound, \$2.50

#### POCKET EDITION.

200 Pages. Arranged for 50 Estimates.  
Size 3½ x 8 in. (oblong). Flexible cloth  
binding, \$0.50

### CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates.  
7 x 12 inches. Cloth bound, \$1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

## The Anthracite Strike.

The anthracite coal strike is now in its fifth month with no assurance of an early settlement and the situation is in many ways a serious one. The miners appear to be conducting their struggle with a grim determination to fight it out to the last. The stand of the operators, on the other hand, is equally unyielding. All efforts, from whatever source, to bring about a settlement by means of arbitration, conciliation or conferences have so far failed of accomplishing any tangible results. Meanwhile stocks of anthracite coal in the East are dwindling in many places to very small proportions, and the specter of a probable coal famine confronts the consumer just as the cold season is setting in. In New York the price of anthracite coal is now absolutely nominal, the dealers having agreed to make their own prices to suit their individual conditions. A few cargoes of Welsh anthracite have arrived and others are on their way to Atlantic ports. It is likely that a good many more shipments will follow if the strike is not speedily brought to a close. While the reports from the anthracite districts indicate that there is a steady increase in the output of the mines that are being worked by nonunion labor, the aggregate amount put on the market is not nearly enough to cover the requirements of consumers in the hard coal using districts. One development in connection with the coal strike, which is becoming very evident, is a growing loss of sympathy for the striking miners in labor circles generally. While many of the labor leaders and representatives of unions speak and appear to be in favor of the miners' strike, it is said that a strong feeling of disapprobation exists in the labor ranks, which is growing steadily as the effect of the strike is becoming felt by the workingmen and their families. While union workmen generally are naturally in full sympathy with the aims of the miners in their efforts to better their condition, they regard the present time as unfavorable for the success of a strike, and many express a strong desire to see the struggle terminated on any terms that may be feasible, so that a fuel famine in the East this winter may be averted. The direct losses to the mine owners and the miners have been enormous and the losses caused to the consuming public have been at least equally great. An early settlement of the present deplorable struggle is desirable, and even essential, in the interests of all concerned.

## Handsome Returns from Agriculture.

That the prosperity of this country is due to the great purchasing power of the people needs no elaborate argument. It is a self evident proposition. Whether the laborer, the skilled mechanic or the farmer be considered, it is found that his remuneration is much above the rate prevailing in other countries. He earns more and therefore has more to spend for necessities, luxuries and pleasures. But while all classes of workers contribute to the wealth of the country they depend primarily on the results of the labor of those who develop its natural resources in the shape of the products of the farm, forest and mine. First in importance among these are the farmers. The crop season is now drawing to a close and we are able to form a fairly accurate opinion as to the yield of the great staples. The results of this year's work of our agriculturists are satisfactory, as practically all crops are equal to or above the average of the past ten years. Thus the basis of continuing prosperity has been well established, and those who depend most directly on the trade of farmers are particularly gratified at the outlook.

In this connection an instructive statistical demonstration comes from North Dakota. According to crop experts the value of farm products in that State this year will be upward of \$100,000,000. The number of families in the commonwealth is placed at 75,000. This year's crops therefore represent an average of \$1400 for each household in the entire State. It is asserted that such a showing has never before been made for any considerable aggregation of people. While North Dakota is essentially an agricultural State, it includes quite a number of thriving cities and towns whose inhabitants are engaged in other occupations than agriculture. To show such an average for every family in the State from farm products alone is undoubtedly a remarkable achievement. Its significance, however, lies in the fact that the purchasing power of the citizens of that State is fixed at a high rate for the coming year. They will have an abundance of money to gratify their tastes and to improve their surroundings. As North Dakota is a typical agricultural State it may be accepted as a fact that a similarly satisfactory showing could be made for the others. North Dakota is not an exception. Farming communities everywhere are enjoying good times, and farmers will continue to be heavy consumers of all kinds of manufactured commodities. The partial failure of the corn crop last year had happily no effect in checking enterprise or lessening confidence. With good crops this year and the good prices for farm products now prevailing one great cause of anxiety has been removed. The basis for another year's very good business has been established, and if the fair prospect is blighted it will be due to some cause not connected with agriculture.

## Trouble with Street Heating Systems.

At this season those who have franchises for the use of street mains for heating buildings test their

piping to determine its condition for the winter work. About the only things the public in general appreciate in connection with such heating plants are the freedom from dust and ashes, secured by an apparatus in the cellar, the avoiding of labor in attending to it, and the fact of having a supply of heat always at their command without effort. Little or nothing is known, however, of the troubles which arise from the piping systems which are buried under the street and are not in use during the summer season. That is the time when rust eats into the piping, particularly at the threaded joints, and also makes the valves stick, so that in many cases, rather than that the valves should be broken the mains are entirely opened or closed, as the case may be. The heating companies also have to contend with the accumulation of rust in the pipes, which is possibly carried to some point and deposited so as to obstruct the distribution of steam. Not infrequently these causes produce leaks which not only waste the steam to the company's disadvantage, but this steam has the effect of wetting the ground around the pipes and damaging the roadway above. Such leaks, however, ultimately come to the attention of the customers of the heating company through failure to secure a satisfactory quantity of steam in especially cold weather, when the demand for more heat naturally arises and is apt to exceed the productive capacity of the heating plant. Sometimes on investigation it is found inexpedient to make the needed repairs, and sections of the piping are shut off, so that the customers of the company are compelled to provide some other means of heating their buildings. Newspaper reports from various localities indicate that the work of extending the mains of heating companies is in many instances behindhand, while in other cases the repairs needed to make the mains already in use available for supplying customers are not likely to be completed before the demands of the customers become urgent. This winter another trouble that will confront both the heating companies and their customers is the increased cost of service. Already the Reading Steam Heating Company of Reading, Pa., who have two miles of heating mains, heating nearly 300 buildings, have notified their customers that the rates for heating will be advanced 20 per cent., and that the company will use soft coal, which, in all probability, will distribute its dirt and soot indiscriminately among those who patronize the company and those who do not.

### Editorial Notes.

It is worthy of more than passing notice that the amount of gold in the United States Treasury at the present time exceeds that of any previous time in the history of the country, and with one exception it is larger than that held by any country at any time in the history of the world. On September 6 the United States Treasury contained \$573,936,194, an increase of over \$79,000,000 since July 1, 1901. The stock of gold in the Treasury is now being added to at the rate of \$200,000 to \$300,000 a day, with the prospect that the movement will continue for some time to come. The Treasury officials look upon the accumulation of gold as evidence of prosperity and confidence in the stability of the country. Gold and silver certificates and United States notes are being issued in place of the gold coin and bullion.

Further evidence of the financial prosperity of the country in the past few years is given in the increase in the bank deposits of the country shown by the figures just published by the Treasury Bureau of Statistics.

These statistics show that the people of the United States have an aggregate of more than \$8,500,000,000 deposited in banks—an average of \$108 per capita. Ten years ago the bank deposits aggregated \$4,232,000,000, or almost exactly half the amount held by the banks to-day. Twenty years ago they were only \$2,600,000,000, or a little more than one-quarter of the present deposits. These figures are compiled from reports of the Comptroller of the Currency, and include the deposits in the national banks and savings banks, State banks, loan and trust companies and private banks, and cover the official figures of the year 1901. During recent years the growth in bank deposits has been very rapid. From 1878 to 1882 the increase was \$877,500,000; from 1882 to 1887, \$500,000,000; from 1887 to 1892, \$1,375,000,000; from 1892 to 1897, \$566,350,000, and from 1897 to 1902, \$3,338,200,000.

### An Iceless Refrigerator.

In these days of horseless vehicles and wireless telegraphy, it is not surprising to learn that an iceless refrigerator has been invented by an Oregon man, who uses the principle of the evaporation of water to reduce temperature. According to the inventor, quoted in the *New York Evening Post*, the iceless refrigerator presents much the same appearance as do ordinary refrigerators. The outer casing and door may be made of plain or expensive woods, as taste may dictate. The upper half and the top are closed tightly. The lower portion is formed of inclined slats, through which air may be freely admitted. The door is also made tight at the top and provided with slats at the bottom. The interior frame is made entirely of galvanized iron, to prevent shrinking and expanding or becoming moldy with constant dampness, and it is also a good conductor of heat, and therefore assists in reducing the temperature lower than it could otherwise be maintained. Burlap or other fibrous material is fastened upon this inside frame so as to form an interior wall, which stands at a sufficient distance from the outer wall of the structure to form an annular space between the two.

In the top of the inner structure is an opening covered with screen material. Through this and the slats around the bottom of the outer casing a constant draft of air passes, thus causing an evaporation of moisture, with which the fibrous material is saturated, so that the interior of the apparatus is maintained at a low temperature. All around the top of this frame is a strip of galvanized iron, with an inclined lip bent over. The edge of the burlap is fastened upon the face of the frame,  $\frac{1}{8}$  inch above the edge of the lip, so that the water which is discharged upon this inclined surface will not flow over the burlap, but will be directed against it, so as to be absorbed, thus saturating the burlap. The fastening for this burlap or other fibrous material consists of a double pointed tack or holder, the head of which is soldered or otherwise secured to the face of the galvanized iron. The fibrous material being pressed over the points they are folded down to hold it in place. This renders it easily removable for change or cleaning.

Above the top of the frame is a tank for holding water. Projecting from the sides and ends of this tank, and at a suitable distance apart, are horizontal pipes having in the outer ends vertically disposed needle valves, which control the flow of water from openings in the lower parts of the pipes. These openings and controlling valves are situated in line above the slanting lips so that water delivered from the openings falls upon the lip and flows down into the fibrous material, keeping it constantly saturated.

At the St. Louis World's Fair great fluted pillars 36 feet high and  $4\frac{1}{2}$  feet in diameter are now being made in a mold set in place, the liquid plaster being poured in at the top. Ordinarily such pillars are made in 24 pieces and set in place, leaving many joints that have to be carefully pointed. There will be 112 such columns on the Textiles Building.

## THE LATE HENRY A. RICHARDSON.

The passing away of Henry A. Richardson removes from the scene of his earthly labors and successes a man who took a very prominent part in the development of the furnace trade of this country. He became connected with the trade in its infancy and was recognized as one of its leaders throughout his entire business career. His genial disposition assisted greatly in securing his own prominence and that of his firm, while the recollection of his unfailing kindness keeps his memory green with all those who were favored with his friendship. He died on Monday, September 16, at his home in Poughkeepsie, N. Y., after a short illness.

Mr. Richardson was born at Leominster, Mass., May 15, 1819, regularly served an apprenticeship at the tin-smithing trade at Montpelier, Vt., and in 1837 embarked in business for himself at West Boylston, Mass. At that time the hot air furnace industry was in its infancy. Later he carried on a business at Worcester, Mass., selling the Chilson hot air furnaces for several years, and subsequently forming a copartnership with an associate under the firm name of Richardson & Loring. While engaged in business in that city he had much experience with the shortcomings of the wood stove of that day, and saw the demand for a wood cook, properly constructed, to remedy these defects. After making a set of drawings embodying his ideas he arranged with Amos Barstow of Providence, R. I., for the manufacture of the stove, which was put on the market and became famous as the Bay State Cook. This was one of the foundations of the success and fortune of Amos Barstow.

In 1847 Mr. Richardson sold out his Worcester business

and entered into partnership with Gardiner Chilson of Boston, Mass., forming the firm of Chilson, Richardson & Co., the unnamed member being the late N. A. Boynton. In 1851 the firm established themselves at 347 Broadway, New York. In 1853 they dropped their Boston connection, and the firm of Richardson & Boynton was established. The desirability of possessing a foundry and manufacturing their own goods led to the formation, in 1854, of the firm of Cox, Richardson & Boynton, Mr. Cox of this firm afterward becoming a member of the firm of Cox, Church & Co. of Troy, N. Y. As a result of the new connection the foundry at Spuyten Duyvil, N. Y., now occupied by the Johnson steel plant, was secured, and the house made a variety of stoves as well as hot air furnaces. They enjoyed a large stove trade both at home and abroad, trading largely in South America and Australia; but the Australian trade had been originally in possession of Scottish foundry men, who filed up the stoves of Cox, Richardson & Boynton after they became popular and used them for patterns, with the firm name on, and by selling them at a lower figure regained their supremacy in this field. The business had now grown to

considerable proportions, but when the panic of 1857 overwhelmed the country the firm, though having assets seven times greater than their liabilities, were forced to the wall through inability to make collections. About two years later Richardson & Boynton again entered the field, and after a struggle of 12 years settled all claims against the old house in full, with interest. They continued in business at 260 Canal street until about 1865, when they moved to 234 Water street, New York, where the business has since been continued, but greatly extending in later years, so that 232 to 236 Water street have been added. During this time the house assumed a leading position in the manufacture of hot air furnaces. Though Mr. Richardson retired 20 years ago, the high standing of the business he founded has been maintained by his four sons, three of whom survive him. Under the ownership and management of A. S., H. T., and Dwight S. Richardson the progressive spirit of the house has lived, newer goods

to meet the demand of the day have been produced and the popularity of the establishment continues.

HENRY A. RICHARDSON.

THE PECK-WILLIAMSON COMPANY, Cincinnati, Ohio, are of the opinion that "the nearest way to a customer's heart is through his coal bin," as the average man is apt to worry about his winter coal bill all through the year. They opine, therefore, that every man who is Furnace hunting has two objects in view: one to buy the Furnace that consumes the least coal, the other to buy the Furnace that gives the most comfort in his rooms. Every dealer is likely to assure him that this or that Furnace will meet these demands, and the customer realizes that he must take somebody's word for it. He cannot satisfy himself by looking at a Furnace,

but must purchase it and then abide by the consequences. The company point out, however, that their Underfeed Furnace is of a different nature, as it shows in itself just what it is. They claim that it burns less coal and gives greater heat—therefore more heat—at one-half or one-third the coal cost. In this Furnace the coal is fed from underneath and the fire eats down into it, consuming the heat generating properties of the coal as fast as they are liberated. A booklet which the company have issued presents a great deal of information relative to the Furnace in question.

THE main building of the Rossmore Stove Works, Peekskill, N. Y., was recently damaged by fire to the extent of several thousands of dollars. The fire started in the third story of the building and had evidently been smoldering for some time before it was discovered. The principal loss resulted from damage to the patterns, but we understand that the loss to property and equipment was fully covered by insurance. As a result of the fire operations in the foundry had to cease for a time, but in the course of a few days everything was in running order in that department.

## The Evolution of a Red Cross Range.

The equipment of a modern foundry for the production of that household necessity, the kitchen range, is a subject of interest to every one connected with the production and sale of these goods. Many who have sold cast iron cooking stoves for years have little idea as to how a new stove is designed and finally produced. It is a common saying among stove manufacturers that it is cheaper to make stoves on paper than it is to make them of wood; and yet, before the castings can be produced they have to be made of wood. Many of our friends among the stove manufacturers may feel that we could leave it unsaid that some stoves are produced by procuring a sample of some popular favorite and using it as a copy to make another as near like it as can be, except in outward appearance, so as to avoid the charge of absolute piracy. The description of how stoves are made which we give below is confined, however, to the methods of those who have ideas and who perfect them in detail before presenting them in stoves. The course pursued by such a house will be understood from the following account of the production of the Red Cross line by the Co-operative Foundry Company of Rochester, N. Y.:

### THE FIRST STEPS.

When the stove manufacturer finds it necessary to supplant some of his old favorites with new constructions more suited to the time, the course pursued by the leading stove makers seldom varies. After the idea that a new stove is a necessity has crystallized a visit is paid to the drafting room, indicated in Fig. 1, for a chat with the head pattern maker, who may be working while he listens or converses. After a preliminary discussion as to the size of the oven and the fire chamber, the size of the top, if it is to be a Red Cross range, and other dimensions are decided upon. Then the question of flask, the amount of sand to be handled and other details receive due consideration and dimensions and tracings are modified with a view to striking a happy medium in economy and presenting the most pleasing appearance. After the sizes of the various parts have been

*The Evolution of a Red Cross Range.—Fig. 1.—The Drafting Room.*

determined, they are drawn to a scale and the general design for ornamentation receives due consideration. Thus after the mechanical engineer has solved the practical problems the artist has his sway. Not infrequently, however, it is necessary for the ideas of both to be modified before the final construction is decided upon.

### PATTERNS.

The principal points being settled, the latest Red Cross range drawings are completed, every part having a drawing to a scale. Then the wood pattern maker takes up his part of the work, which begins with a study of the drawings, after which the work is taken in hand, as shown in Fig. 2. Notwithstanding that the drawings given to the wood pattern maker have anticipated as far as possible every little detail that will aid the molder in making a good casting and assist the mounter in putting the range together promptly while contributing the strength that will make a good stove,

the pattern maker is often confronted with practical difficulties which he must overcome. The stove dealer is also considered by making the parts so that when repairs are needed they can be readily put in place. The wood pattern maker is frequently called upon to display his ingenuity in contributing to the construction, for the

*Fig. 2.—The Wood Pattern Shop.*

scheme may have need of further perfection in the pattern itself. Soft, strong, straight grained white pine is the wood that is most generally used in the construction of stove patterns, and every part is made of wood exactly the same as it goes to the dealer in cast iron. A wood pattern maker not only has to make his patterns of a suitable thickness but must also consider that a casting made from a pattern will shrink a certain percentage and that as the stoves must be made of iron he must allow for two shrinkages. After the patterns have been completed they are treated to a coat of shellac to prevent the dampness of the sand in the foundry from swelling and warping them. After a set of castings is taken off, which operation has to be done very carefully by a skillful molder, they are taken to the pattern fitting shop, shown in Fig. 3. Here they are dressed with files

*Fig. 3.—The Iron Pattern Shop.*

and chasers and not only made to fit perfectly but are also made perfectly smooth and then waxed so that they will not rust or allow the sand to stick to them.

### IN THE FOUNDRY.

In the construction of the Red Cross ranges great care is taken in both the wood pattern shop and the iron pattern fitting shop to facilitate the work of the molder as well as to contribute to the durability of the range and to the excellent appearance for which the Red Cross ranges are well known. When the patterns are completed they are sent to the foundry and the molders have their opportunity of looking over them, preparatory to making the molds in sand into which the iron is poured to make the castings that go to make the complete Red Cross range. The view presented in Fig. 4 shows one of the molders in the act of putting the iron pattern in the sand, while another is ramming the sand tight in a mold in which there is a pattern. A mold is originally made in a flask, which consists of two parts. The mold for one part of the castings is made in the lower half of the flask, after which the face of the mold is sprinkled with what is called parting sand. The upper part of the flask is then put on and more sand is shoveled in. If, however, the casting is to have a perfectly smooth surface a fine powder, called facing, is sprinkled all over it before the sand is shoveled in. Then the sand is shoveled in and rammed hard, so that when the upper part of the mold is lifted off the pattern can be taken out and the sand will not fall. This is where the molder has an op-

portunity to display a great deal of skill. The variation in thickness of the different parts of the casting will have a tendency to draw the casting out of shape when the red hot iron cools, shrinks and contracts. To avoid this the mold is rammed hard in some places and but a little in others, just enough to keep the sand from falling at any other place. The molder at times, notwithstanding his long experience and skill, may have to work on one pattern for several days before he solves the problem of making strong, true castings successfully. In order to get the iron into the mold holes are left, which are called gates. These holes do not lead into the mold proper, but frequently little gutters are cut from the hole to the mold, through which the iron enters it. A round hole is used for making some sorts of castings,

Fig. 4.—Molders at Work.

and for others a long wedge shape is provided in the mold and the iron enters the mold proper through the hole, which sometimes is as much as 5 or 6 inches long and less than  $\frac{1}{4}$  inch wide.

#### THE MOLDING PROCESS.

Having solved the problem of making the casting successfully and the proper place for arranging the gates, the molder will begin his day's work by digging over the sand, which has been wetted down the night before, for the purpose of securing an even dampness throughout. Then he is ready to take up the work of making the molds. This continues until the afternoon, when, according to his degree of skill and the character of the job, the molder will either be through his work of making molds in time for a little rest before the iron is ready for pouring off, or he may have to hurry toward the end. The view in the foundry presented in Fig. 5

Fig. 5.—View in Foundry.

shows the finished molds ready to receive the molten iron. In Fig. 6 the molders are seen standing around the cupola ready to catch a ladle full of molten iron. Some castings require the iron to be very hot, while others can be poured when the iron is in a less fluid state. Some

castings are better when the ladle is held high above the mold and some pressure put on it when the iron is poured in. In Fig. 7 is shown a molder who has walked some distance down the foundry with his ladle containing sometimes as much as 60 pounds of molten iron. All of the molds are vented in various ways. Not in-

Fig. 6.—Waiting for the Iron.

frequently a small wire is pushed down through the sand in a great number of places to the pattern while it is in the mold for the escape of the gases created by the facing or other materials in the sand being burned by the hot iron. After the molder has poured off and has filled all of his molds with hot iron, he is ready to begin "shaking out" the small castings which have cooled and piling them up in the gangway, also piling his flasks where they will be convenient for the next day's work. Most of the castings are stacked up before he leaves the shop. Some of the larger ones are allowed to cool

Fig. 7.—Pouring Off.

in the molds and are left to be "shaken out" by the watchman during the night.

#### FINISHING THE STOVES.

In the morning all the work made on the previous day is taken to the cleaning room, where the castings are cleaned of all sand, rough spots and fins, and are sent to the mounting shop. The mounting shop, shown in Fig. 8, is generally provided with emery wheels and such other articles as will facilitate putting the stoves together ready for shipment to customers. Before the stoves are taken off the mounting floor an inspector examines them to see that each one is properly fitted and has all the parts belonging to it, such as mica, nickel plate, cover lifter, ash pan and all the other details that go to make the perfect stove. This is done so that the dealer will have no cause for complaining that the stove is short of some of its equipment. Special care is taken by the Co-operative Foundry Company to see that the stoves sent out from their plant are perfectly fitted in every part so that there can be no danger of breaking or cracking when the first fire is made and also that they are provided with all the appurtenances which they re-

quire to make them complete before they are stored in the warehouse.

The company have recently issued an illustrated pamphlet of 16 pages describing how a stove is made and explaining their care in selecting the best grade of molding sand and in making a proper mixture of pig iron, so as to secure for the Red Cross ranges the very best product that years of experience can turn out. This

Fig. 8.—View in the Mounting Shop.

pamphlet also presents different views of the Imperial Red Cross range, in the interest of which the work has been prepared.

### Peninsular Stoves, Ranges and Heaters.

We have received from the Peninsular Stove Company, Detroit, Mich., a copy of their Catalogue No 208, consisting of 128 pages, profusely illustrated with well executed engravings of attractive lines of Peninsular stoves, ranges and heaters, which are offered in extensive variety. The volume measures  $11\frac{1}{2} \times 8$  inches in size and on the front cover is an interior view of a stove foundry, showing the molders pouring the molting metal. In the upper left hand corner is a sunburst with a fac-simile of the company's trade-mark printed in colors. The fourth page of the cover shows a fac-simile of the guarantee bond which the company give with each stove or furnace sold. The entire make up of the volume is rich and attractive, and shows the recent progress and present high standard of stove, range and furnace manufacture as embodied in the goods of the Peninsular Stove Company.

The opening pages are devoted to a statement of terms and discounts, with reference to breakage and freight overcharges. A very interesting description is presented of the manufacture of the Peninsular planished steel range, the essential features of construction being shown by means of independent broken engravings. The leading place is given to the Electro Peninsular steel range, which, boiler like, is hand riveted every 2 inches with steeple headed rivets, driven cold. This stove is designed for using coal or wood and is offered in the usual styles and sizes. The Elegant and Active Peninsular are also members of this general class, embodying features which are characteristic of this line of the company's goods. Under the names Peninsular and Perfect Peninsular the company offer some attractive steel ranges adapted for hotels, restaurants, boarding houses, club houses, public institutions and other places where it is necessary to prepare food for a large number of people. Following these, attention is given to the Peninsular planished steel gas ranges, which are designed for using either artificial or natural gas. These are handsome constructions, offered in many varieties, and running from three burners up to constructions having eight top burners and two simmering burners. Several lines of combination ranges intended for using artificial or natural gas or coal or 24-inch wood are also shown.

The cast goods in the way of cook stoves and ranges occupy 40 pages of the catalogue and constitute a handsome assortment. Nickel has been combined with cast ornamentation in a way to produce striking results, while the constructive features are such as to render the goods satisfactory in operation.

The heating stoves occupy 30 pages following the cook stoves and ranges, attention being first invited to the Noble Peninsular, a handsome low priced base burner, which is said to embody in its construction many practical points of the highest priced base burners. The claim is made that it is the only stove of its class equipped with duplex grate and annular shaking ring. The fire pot is deep, extra heavy and has a convex top. The Empire Peninsular which follows is referred to as thoroughly up to date in all respects. It is of a reflector style of top, which form of construction it is claimed adds greatly to the heating power, while at the same time giving a most brilliant effect when the stove is in operation. It is made as a double heater and one size with and four sizes without oven.

The leading base burner is the Sunburst Peninsular made for using hard coal or coke. It takes its name from the appearance which it presents when in operation, the ample mica illumination permitting the glowing coals to send their streams of radiant light in all directions. The special features of the stove are illustrated by means of separate engravings, which add much to the interest of the matter. Among the goods to which attention is given in the following pages may be mentioned oak stoves, smoke consuming hot blast slack burners, cottage parlor surface burners, globe, cannon, laundry and box stoves.

The closing pages of the catalogue are given up to Peninsular warm air furnaces and hot water and warm air heaters adapted for all fuels. A feature which the stove dealer will appreciate, especially if he does a large repair business, is the outline cuts of steel and cast ranges, coal and wood cooks and of a base burner, which are to be found among the closing pages. The various parts of the stoves are numbered, each number referring to an explanatory table giving the correct name of that part. There are also given some directions for ordering repairs, which if carefully followed by the dealer will tend to prevent many of the annoying mistakes which are constantly occurring in this branch of the business.

### The Williams Adjustable Stove Pipe Fastener.

The Lawrence Stamping Works, North Lawrence, N. Y., are manufacturing the Williams patent adjustable stove pipe fastener, of which an illustration is given herewith. This fastener is described as simple and effective, and of such mechanical construction that it can be easily adjusted to the chimney flue and the pipe to

The Williams Adjustable Stove Pipe Fastener.

be connected with the fastener. The fastener is drawn firmly to the chimney breast by straightening the adjustable bar which forms a double hook when the fastener is in place. It has a strong pipe clamp fitted with malleable iron ears which extend outside the pipe ring, forming a positive grip on a stove or elbow. It also clamps the asbestos flue stop, indicated at No. 2 in the illustration, to the chimney by the simple method of tightening a stove bolt. Another feature of the Williams fastener to which the manufacturers call attention

is the wiring attachment, which provides a positive anchor for adjoining sections, preventing them from becoming disconnected and protecting the wall or ceiling from the use of destructive hooks or nails for wiring purposes. The pipe ring is of the ordinary type and finish. The fastener is made of aluminum coated steel in three sizes—5, 6 and 7 inches in diameter respectively, and is sold by the company on a guarantee.

### The 400 Series Quaker Furnace.

The Quaker Mfg. Company, Chicago Heights, Ill., are now enjoying the full facilities of the model plant which was erected to take the place of the establishment that was burned some time since, when the com-

The 400 Series Quaker Furnace.—Fig. 1.—Broken View.

pany were operating under the name of the Wireton Heating Company. The foundry, assembling room, sheet metal department, warehouse, shipping department and office facilities have all been arranged with a view to handling the hot air furnace business promptly, so as to satisfy customers and to turn out a product

Fig. 2.—The Grate and Ash Pit.

that will increase the popularity of the Quaker goods as they become more widely used. The company have spent \$20,000 recently in new furnace patterns, and the new 400 Series Quaker furnace, a broken view of which is shown in Fig. 1, is one of their newest productions.

This furnace is constructed with a heavy steel shell  $\frac{1}{8}$  inch thick, which encircles the fire box, combustion chamber and ash pit. This has a dome made of 3-16 inch steel, flanged and riveted in, making it perfectly air and water tight. The fire box is lined either with fire bricks or with heavy sectional cast iron lining. The

combustion chamber is large, which facilitates the perfect consumption of the gases, which then escape from the fire box to the outer chamber. After heating the dome and upper portion, they dive to the bottom and find their way to the smoke outlet through the vertical steel box at the rear. When the cold air enters the furnace it strikes a surface continually increasing in temperature as it passes upward, resulting in a strong heating capacity and a lively flow of hot air. These furnaces are equipped with a grate and ash pit, as shown in Fig. 2, which has triangular bars of the labor saving type, and so connected that any bar can be readily removed or replaced for repairs. The construction of the ash pit and ash door is such that in case of necessity the furnace can be placed 6 inches lower than the level of the basement floor, increasing the elevation that can be given to the hot air pipes in low cellars.

The company also make a special wall register and their time regulator for controlling the draft of furnaces has established a wide popularity. They are prepared to furnish combination water heaters for use in connection with their furnaces, and have a full line of fittings and supplies.

### Columbian Stoves, Ranges and Furnaces.

The Keeley Stove Company, with main office and foundry at Columbia, Pa., have just issued from the press a 186-page catalogue of the Columbian stoves, ranges, furnaces and hot water specialties, which they manufacture in many varieties. A conspicuous feature of the catalogue is a page group of portraits of the officers and other representatives of the company. The opening pages are devoted to some remarks on the subject of setting up a stove; directions for ordering repairs and price-lists of fire brick and stove linings which the company are in a position to furnish. The leading place in the catalogue is given to the Columbian Peerless range with horizontal circulating boiler, which is inclosed and occupies a position directly over the elevated ovens. Under the name Twin Peerless, the company offer a range designed for the use of hotels, restaurants, boarding houses, &c. Following these may be mentioned the Columbian Victor, a builders' portable range made with right and left hand ovens; the Columbian Choice, a six-hole range made with right-hand ovens only; the Columbian Emblem, New Cappello, the Happy Home, the Columbian Expert and the Columbian Fairy ranges, the latter being made with flat grate only and with five holes in the top surface. The leading coal cook stove is the Columbian Merit, made with triplex grate, cast iron linings and capacious ash pan; followed by the Columbian Rival, and Fame, for wood only, and the Columbian Favorite, also intended for using wood as a fuel.

Among the heating stoves, attention is first invited to the Columbian Art Circulator, which is offered in two sizes. Following this is the Columbian Coral, a full reversible flue double heater in four sizes; the Black Diamond air tight double heater, made in three sizes; the Columbian Magic, a direct draft heater; the Columbian Oak, a double heater fitted with duplex grate; as well as various lines of globe, cannon, box and laundry stoves, fire plate heaters, air tights and school house heaters. The closing pages are given up to hot air and hot water furnaces, which are shown in a variety of styles accompanied by directions for setting, hollow ware, stove trimmings and a chapter relating to repairs. Illustrations are given showing the principal parts for which repairs are generally wanted, accompanied by explanatory text, which cannot fail to prove of convenience to the dealer.

ONE of the advertising novelties now being furnished by the Michigan Stove Company to their agents is a very attractive plate, to be fastened to a store door. This plate bears the frequently desirable winter injunction to customers to "Please close the door." It is made of tin, which is decorated with a silver finish, while the lettering is embossed in black. The plate also bears a request to those who read the notice to use Garland Stoves and Ranges.

### THE NEW P. P. STEWART RANGE.

The latest addition to the extensive line of P. P. Stewart ranges made by the Fuller & Warren Company, Troy, N. Y., embraces many unique features, and while constructed in accordance with the general scheme of Stewart cooking apparatus, embodies improvements not found in other makes. Prominent among these features may be mentioned the heat retaining oven with flues entirely surrounding five sides, thereby uniformly dis-

The New P. P. Stewart Range.—Fig. 1.—Broken View of Range, Showing Oven Construction.

tributing the heat. The oven top is cemented in order to keep the heat from striking too quickly into the oven, and the range bottom, end panels and back plate are also cemented in order to retain the heat in the flues. We present in Fig. 1 of the engravings a broken view of the range and the oven showing, by means of arrows, the course of the products of combustion as they leave the fire chamber and after passing round the oven escape through the flues at the back. It will also be seen from an inspection of the cut that the little squares which

Fig. 2.—Method of Fastening in Place the Removable Nickel Band.

are cement and a nonconductor of heat are on the outer side of the flue. The result of this construction, the manufacturers claim, is "perfection in baking qualities with the greatest possible economy in fuel."

Another interesting feature in connection with this new P. P. Stewart range is the removable nickel work, the band and other parts which are nicked being easily removed for the purpose of polishing them or for blackening the stove. The band is held firmly in position by means of a thumb screw, the manner of attachment being clearly indicated in Fig. 2 of the engravings. The top band is made in three pieces, which lessens the danger of breaking and at the same time renders it much easier to clean and attach.

Still another feature of this range which will appeal to the wide awake and intelligent dealer as an important selling point is the construction of the skirting. The tendency of the times is to make the skirting on all ranges so deep that it is impossible to clean under it. The company, however, have arranged the false

front of the new P. P. Stewart to lift up so as to permit the cleanly housewife to sweep or clean under the range. The construction is such that the skirting can be lifted up with the foot and dropped back into place in the same manner without removing any bolts or other parts of the stove. When it is desired to hold up the skirting a brace falls into place, as shown in Fig. 3, and is made to slide back through a slot by a slight touch or gentle kick of the foot. The range is not disfigured by this plan, and it is impossible without close examination to determine the joint. The device is something entirely new and is controlled by the company's patents.

A point to which the manufacturers also call special attention is the sliding hearth, which is claimed to be a marked advantage over the so-called "swing" or "drop" hearth, as it affords a solid resting place for a full ash pan when removed from the pit and gives an opportunity to brush into the pan what few ashes may remain on the edges. Other features of the range include

Fig. 3.—Showing Method of Holding Up the Skirting.

direct draft damper with outside connection; dockash and triangular grates which fit the same bed plate and are therefore interchangeable and readily removable; special construction of the fire box, which is lined with heavy fire brick, and the water heater attachment for connection with a circulating boiler for the purpose of supplying hot water to various parts of the house.

The external treatment of the range is rich and effective, nickel being judiciously employed to form a striking contrast in combination with the black iron surfaces. A noticeable feature is the name plate on the oven door and carrying an oven indicator, showing at a glance the temperature within. This saves the cook the annoyance of constantly testing the oven in order to determine its condition for baking. The stove is made in four sizes with six boiler holes in the top surface, and in referring to the range the company state that it is "fitted with many novel devices which add to its convenience and its attractiveness and win the permanent regard of every family in which it is installed."

### Foundry Supplies.

From their Detroit office the S. Obermayer Company have just issued the first number of a bright leaflet called "The Obermayer Bulletin of Foundry Information." It is intended to issue the "Bulletin" periodically, and devote it to subjects of general interest to foundrymen. The first issue is chiefly devoted to an examination of the molder by the editor regarding the chemical properties of pig iron. Of course the molder shows how little he knows about the subject, and the "chemist" conveniently steps in and answers the questions of the editor in dignified style. The answers are, however, put very plainly for a chemist, and there is no reason why the molder should not in time know as much about pig iron as his learned brother.

## THE NEW SUPERIOR HOT BLAST FURNACE.

In view of the present situation in the anthracite coal regions and the consequent scarcity of hard coal, special interest attaches to heating devices adapted to burning soft coal as a fuel. A furnace embodying features which particularly adapt it for using coal of this nature is the New Superior hot blast, which is being offered to the trade in all the usual sizes by the Utica Heater Company, Utica, N. Y. The manufacturers point out that this construction embodies the latest and most improved features known to modern furnace building and represents correct scientific principles, developed after many years of experience in the manufacture of heating apparatus. They also mention the fact that the hot air blast is the great principle involved in the construction of this furnace for burning soft coal and especially refer to the feature of injecting into the combustion chamber above the fire pot a large volume of highly heated oxygen, which, commingling with the nitrogen, sulphur and smoke arising from the fresh coal, thoroughly ignites and consumes these gases, thereby insuring a perfect combustion.

The castings of the furnace are made extra heavy with a view to durability and economy, and at the same

*The New Superior Hot Blast Furnace.*

time insuring the greatest amount of heat for the fuel consumed. Each furnace is mounted and fitted with special care, ample provision being made for expansion and contraction of the castings without bolted joints. The construction is such that dust, gas and smoke are prevented from penetrating into the hot air chamber of the furnace, and the manufacturers state that while they advocate cast iron radiators in this type of furnace they can furnish heavy steel radiators when desired.

## Royal Furnaces on the Pacific Coast.

The Royal Heating Company, 617 Mason street, San Francisco, Cal., are increasing the popularity along the Pacific Coast of the Royal line of hot air furnaces and steam and hot water heaters made by the Hart & Crouse Company of Utica, N. Y. At the present time they are installing an extensive hot air furnace plant in the palatial residence of Mrs. Maurice Casey. They are using a large size Royal furnace on their one-pipe system, the pipes in every case being made double with an air space between. In this instance three pipes lead from the furnace, each of which supplies six branches. These main pipes are of galvanized iron, 15½ x 29, 14 x 26 and 12 x 23 inches in size, and made double with ½ inch air space between. The company are also heating a large apartment house for Dr. Bowes, using two large size Royal hot air furnaces, and they are installing in a Convent at East Oakes a No. 77 Royal steam heating boiler. In the winery of Bradford & Sons, at Bruceville, the concern are using two No. 50 Royal wood burning fur-

naces for heating two sherry cellars, which are to be kept an even temperature of 150 degrees for 90 days at a time.

## PITTSBURGH SUPPLY COMPANY'S NEW CATALOGUE.

Catalogue No. 20 for 1902-3, which has just been issued by the Pittsburgh Supply Company, 227 to 233 Water street, Pittsburgh, Pa., is an unusually comprehensive presentation of goods for the gas trade. The contents comprise gas ranges, stoves, radiators, fire place heaters, stove trimmings and appliances, gas and gasoline burners for both heating and illuminating, pipe cutting machinery, gas fitters' tools and in short all kinds of supplies for the gas trade. It comprises 114 pages, is well printed and finely illustrated and is bound in heavy paper covers with an illuminated front cover.

The company's new gas range, the Avalon, is given first place, a number of pages being used in showing this most attractive range in a variety of styles. It is designed for the use of natural or manufactured gas, made in cabinet form as well as mounted on legs, with full cast iron or planished iron body, with or without an extension for water heater and in a variety of sizes to meet all requirements. The Regina, Colonial Regina Volcano, Edna, Edna Special and Solar are handsome new fire place heaters, which differ from one another in details of shape, burners, size and finish. Other gas stoves shown are the Classic, Multiple-Action, Empire Odin, Simpson, Peerless Queen, Capital, Yorktown, Acme, Success, Pittsburgh, Colonial Pittsburgh, Relda, Improved Duquesne, Economy, Victor, Erie, Gem, Imperial, Monarch, Yale, Harvard, Elite, Rococo and Special and Meteor Radiators, all of these being room heaters. They further show the Midget and Acme heaters for heating with hot air. The length of this list shows the thoroughness with which the company have covered the field of gas heating appliances. No less than five water heaters are illustrated—namely, the Monarch and Gabel, Instantaneous Automatic and the Rival, Lawson's and New Process boiler heaters. The New Process Broiler is an interesting special construction, consisting of a cast iron stove of ornamental appearance, 27 inches high, 13 inches wide and 25 inches deep, having a large burner on each side for vertically broiling meat, broiling both sides at the same time. The assortment of stoves is rendered complete by the usual hot plates.

The catalogue is sufficiently large to permit generous treatment to be given to the subject of gas stove and gas fitters' supplies. For this reason, if for no other, the publication should be of special interest and high value to the trade.

## The Bay State Home Grand Range.

The Bay State Home Grand range is the subject of an attractively printed eight-page pamphlet bound in colored paper covers, which is being distributed among the trade by the Barstow Stove Company, Providence, R. I. The claim is made that in this range are embodied all the latest features and improvements for minimizing the labor in cooking and obtaining the best results with the least fuel. The main top is devoted entirely to cooking space, and each hole in the top is rendered equally serviceable by reason of an ingenious arrangement of the smoke flue. The top is made in four sections, so that cracking and warping are reduced to a minimum, and the cost of repairs is also reduced, as when one section only is required it is not necessary to replace the entire top. The oven is large and ventilated, having triple heat retaining back lined with asbestos, large clean out cover in the oven bottom for examining the flue construction and aluminum plated oven back which reflects the light and clearly shows the condition of the baking. An oven rake extends across the oven bottom and is operated by a nicked pull in front, so that the contents of the oven may be drawn forward without reaching the hand into the hot oven. By means of a simple locking device the oven rack when pulled out to its full width remains rigidly in position, affording opportunity of turning around the roast or loaf, after which the rack

can be pushed back in position, while at the same time it is removed as readily as the ordinary rack. Four styles of grates can be furnished, according to requirements, and each style is removable through the fire door opening without disturbing the linings or the fire box parts. A feature of the external treatment of the range is the removable nicked parts for the purpose of cleaning them or blackening the range. The Bay State gas attachment can be supplied when desired, this being referred to as an ideal appliance for summer cooking. It consists of two gas cooking lids, which replace the ordinary covers on the back end of the range. The Bay State Home Grand is made in all sizes from that required by the small family up to the hotel size.

### ODD PLATES.

THE GOBEILLE PATTERN COMPANY, Cleveland, Ohio, of which Joseph Leon Gobeille is president and treasurer, have recently secured the services of R. H. Perdue, late advertising manager of the *Cleveland Leader*, to attend to the company's advertising and credits. Mr. Perdue, who has been elected vice-president of the company, is a young man of means and an artist of ability, and the company, in securing his services, have made an important addition to their staff.

A BLOTTER that is being distributed by the United States Register Company, Limited, 61 and 63 North State street, Battle Creek, Mich., bears a picture and some details of their well-known Jones Side Wall Warm Air Register, with a request that the trade should write to the company for catalogues, prices and testimonials.

A 16-PAGE CATALOGUE, intended for temporary use only, bound in paper covers of unique design and illustrating some of the leading lines of Hotel Ranges and culinary appliances which they manufacture, has just been issued by the Brand Stove Company of Milwaukee, Wis. The apparatus illustrated is made up with special care, three essential qualities being kept in view—namely, quick results, economy and lasting qualities. Brand's Wrought Steel Hotel Range, which is illustrated in several varieties, is made for either hard or soft coal or wood and with any style of top desired. Illustrations are also given of Brand's Wrought Steel Hotel Laundry Stove, Portable Ovens, Steam Tables, Carving Tables, Urns, &c. The company announce that a complete catalogue, illustrating the full line of Hotel Ranges and other appliances which they manufacture, is in process of preparation and will be issued to the trade as soon as ready. An interesting feature of the present catalogue is a bird's-eye view of the company's works.

THE SPILLER MFG. COMPANY of Austin, Texas, have been incorporated with a capital stock of \$10,000, to manufacture Stoves, Oil Burners, &c. The incorporators are P. S. Spiller, J. K. Dorman, C. L. Test and H. P. Hilliard.

THE death of Edmond T. W. Richmond of the Richmond Gas Stove & Water Company, Limited, of London and Warrington, England, occurred on September 4 from concussion of the brain, the result of a bicycle accident met with while touring in Cornwall. Mr. Richmond, who was only 38 years of age, was the founder and head of the large Gas Stove manufacturing concern which bears his name. He visited the United States last year.

THE ROCHESTER RADIATOR COMPANY of Rochester, N. Y., have lately been incorporated with a capital of \$20,000, all paid in. The officers are: William M. Hunt, president, and Frank E. Williams, secretary and treasurer. The company make a specialty of Radiators for connection with the smoke pipes of Stoves and other heating apparatus. They have celebrated their tenth anniversary by incorporation, and have issued a little pamphlet entitled "Tenth Anniversary Souvenir," devoted largely to "Fun and Facts." The main portion of the book contains a number of witty sayings interspersed with remarks about the Rochester Radiator, while the last pages are devoted to a complete explanation of that device. The company state that in the past ten years, through persistent effort and extensive advertising, they have established a demand for the Rochester Radi-

ator in every State and Territory of this country and in foreign countries. The "Fun and Facts" souvenir can be secured on application.

THE FOX FURNACE COMPANY of Cleveland, manufacturers of Furnaces, will enlarge their plant at Elyria, Ohio, and will engage in the manufacture of other lines of goods. The plant has been enlarged twice within a year and the new shops will double their capacity.

A. L. CANFIELD, 284 Pearl street, New York, is interesting the Stove dealers this year in the varied line of Monarch Gas Heaters and Radiators. One of these Heaters is so constructed that it can also be used as a hard coal Stove. He is also showing the Reliable and Electric Oil Heaters, the demand for gas and oil heating apparatus being active on account of the difficulty in securing coal for fuel.

THE MICHIGAN STOVE COMPANY are supplying their customers with timely advertising suggestions. They furnish a large sheet, which shows many styles of advertisements which will greatly assist busy merchants in preparing desirable advertising matter for their local newspapers. Another sheet gives suggestions for local reading notices. These notices are prepared by a person of experience in handling matters of that kind, and are not only practical, but are well calculated to arrest the attention of the reader. The company furnish the necessary electrotypes of their trade-mark or of their Stoves to be used in these advertisements.

THE WESTERN FOUNDRY COMPANY, LIMITED, of Wingham, Ontario, have just issued an announcement to the trade to the effect that they have entered into the business of making a specialty of the manufacture of Ranges. The company have purchased a large and thoroughly equipped plant occupying  $3\frac{1}{2}$  acres of ground at Wingham and so located as to give admirable shipping facilities. Their patterns are constructed on modern lines, embodying novel and unique features designed to afford satisfaction in cooking operations, combined with an economical consumption of fuel. The goods will be offered under the name Huron, this being the trade-mark the manufacturers have adopted. The men prominently identified with the company are F. J. Taylor and J. J. Cunningham, who are familiar to the Canadian trade, having been identified for many years with a large Stove and Range company in the Dominion. The announcement to the trade is sent out in a style to attract attention, and among the illustrations presented is a bird's-eye view of the office and works.

THE GOLD COIN STOVE COMPANY of Troy, N. Y., and the Chicago Stove Works of Chicago, Ill., are offering the trade some handsome constructions in the way of Base Burners for using hard coal. Prominent among these may be mentioned the Marvel, a medium priced Heater embodying the essential features of the higher grade goods; the Ideal Gold Coin, a richly furnished full nicked Double Heater, and the Original Gold Coin Ventiduct Base Burner, which is offered in its new twentieth century dress.

WM. S. ESSICK, for some time past secretary and general manager of the Reading Stove Works, Orr, Painter & Co., proprietors, Reading, Pa., will resign his position with that company about October 1. We understand that Mr. Essick has thus far made no new connection.

THE Stove Salesmen's Association of Pennsylvania, with headquarters in Philadelphia, Pa., announce that a theater benefit will be given at the Chestnut Street Theater, in that city, during the week of November 10 to 14, the attraction being "The Billionaire," by Jerome Sykes. The proceeds of the benefit are to be applied to several purposes, the principal one being toward the success of the sixth annual banquet of the association, which will be held some time in December, and which, it is expected, will eclipse by far any of their previous efforts in that direction. The committee having the benefit in charge consists of H. E. Borzei, chairman; Fred. Sabin, John McLaughlin and W. T. Halowell, secretary, 111 North Second street, Philadelphia, from any of whom tickets may be obtained.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, suggest to dealers that it will pay them to

write for catalogue of and prices on Thatcher Furnaces, Ranges, Steam and Hot Water Heaters, &c. These goods have been on the market long enough for them to establish an enviable reputation, and the company point out "that there's something in having borne a good name for 52 years."

THE CHAMPION STEEL RANGE COMPANY, Cleveland, Ohio, have been distributing with their compliments a poster calendar for the remaining months of the year and for the 12 months of 1903. It is lithographed in colors, bound at top and bottom with metal strips, and is furnished with an eye for hanging it in a conspicuous place. The poster calls attention to the Champion and Marquart Double Flue Hot Blast Steel Ranges, which the company manufacture in many varieties. These constructions embody modern features, and are furnished in three styles of finish—japanned, polished steel and Russia iron. Special attention is called to the flue construction, more particularly the double flue below the oven which leads from the outside draft to the fire box, thus furnishing a hot air blast to the fire. The manufacturers claim that by this arrangement intense heat is secured with a minimum consumption of fuel.

THE present high price of anthracite coal and the prospect of there being more or less of a scarcity of this kind of fuel for some little time to come serve to draw attention to the many devices now on the market designed to utilize some of the waste heat which usually escapes to the chimney. Prominent among these may be mentioned the New Era Radiator, made by Wilmot Castle & Co., 76 Elm street, Rochester, N. Y., who claim that by the use of this form of Radiator a person can get as much heat out of one ton of coal as would be derived from two tons without it. The company also announce that they make a special Radiator for soft coal, and intimate to dealers that October is a great month to sell them.

LORD, STONE & Co., Otter River, Mass., have found it necessary, owing to the increasing demands of the trade, to secure additional accommodations. They have just leased additional room, and with their increased facilities expect to be able to fill orders more promptly than before.

THE HOME PRIDE RANGE COMPANY of Marion, Ind., have just filed papers of incorporation for the manufacture of Cook Stoves and Ranges, the capital stock being placed at \$25,000. The directors are C. W. Haldeman, O. C. Haldeman and Robert C. Houston.

THE GRISWOLD MFG. COMPANY, Erie, Pa., have recently purchased a new site for their plant adjacent to the railroads, thus giving them increased shipping facilities. This fall they are moving about half of their equipment, and in the spring they intend to put up a large foundry so as to have their manufacturing facilities concentrated in one place. A 40-page pamphlet, which the company have recently issued, sets forth the merits of the Classic and Erie Gas Ranges, Hot Plates, Ovens and other Gas Cooking Appliances which they manufacture. Within the pages the many improvements which the company have incorporated in their goods are described and the new patterns which have been added to their already extensive assortment are illustrated, accompanied by an enumeration of their leading features.

THE BACKUS COMPANY, Brandon, Vt., show their leading lines of specialties in a neatly printed catalogue of oblong shape which they have issued from the press. The Backus lines include Portable Steam Radiators for gaseous fuel, Radiating Mantels, Tiles, Open Fire Places, Gas Logs, &c. The company state that an entire house can be heated by means of the Backus Patent Steam Radiator Heater, and that there are now 30,000 of these in use.

CHRISTOPHER B. PORTER, head of the firm of C. B. Porter & Co. of Philadelphia, manufacturers of Tinware, &c., died on September 22, at his home in that city, aged 78 years. Mr. Porter was one of the pioneer Tinware manufacturers of Philadelphia, and his company are among the old established and most important

concerns in their line in that city. The funeral services were held on Friday, at his former residence, 1612 North Broad street.

### Tropical Oil Heater.

The Holmes, Boeth & Haydens Company, 37 Park place, New York City, have taken advantage of the present condition of the fuel supply in the East, caused by the anthracite coal strike, to bring forward their Tropical oil heater, a view of which is given in Fig.

No. 25

Tropical Oil Heater.—Fig. 1.—View of Heater.

1. This heater is made in two sizes, the larger one, suitable for bathrooms and bedrooms, having a No. 3 fount holding one gallon of oil, and the smaller one having a No. 2 fount holding two quarts of oil, the latter being adapted for use in smoking rooms, libraries or small apartments. These heaters are exactly similar in appearance and are, respectively, 25 and 21½ inches in height to the top of the bail handle. They are finished in black japan with nickel plated trimmings and are guaranteed to be both smokeless and odorless. The large heater, known as No. 35, weighs 25 pounds

Fig. 2.—View of Burner.

and takes a No. 3 Perfection wick, and the smaller, or No. 25, shown in the cut, weighs 15 pounds and takes a No. 2 Perfection wick. The heaters are equipped with a covered wick flame spreader. In Fig. 2 is given a view of the burner, which indicates the character of the flame and of the operation of the heater. It is pointed out that the heater cannot smoke, as the stop nut, A, limits the upward movement of the flame spreader, B, and the flame spreader, B, limits the upward movement of the wick. The gallery, C, is detachable by unscrewing for the purpose of cleaning and rewicking. These heaters are claimed to be absolutely safe in use and to give a maximum of heat at a minimum of cost. They will warm up an ordinary room in a few minutes, providing a comfortable heat at a much less cost than if coal were burned.

## THE PLUMBING AND STEAM SUPPLY LEAGUE.

All arrangements have been completed for the bowling tournament of the Plumbing and Steam Supply League for the winter of 1902 and 1903. It will be opened in the Monarch Palace Alleys at Twenty-sixth street and Sixth avenue, New York, next Monday night. It is expected that all the officers will be present on that occasion. The officers are: President, Martin Behrer; vice-president, C. V. Driggs; secretary, W. G. McCormick; treasurer, Fred. Lowe; captain, W. S. Emery; Board of Managers, A. E. Good, W. B. Ogg, A. B. Beith, William M. Murray and William Waldenberg. Owing to his familiarity with the work, ex-Secretary Rollin C. Wilson has acted as secretary and made out the schedule, which is being prepared for distribution. He has sent out the following letter to the captains of the various teams, giving the schedule for the first two weeks of the tournament:

The schedule for the first two weeks' rolling in the coming tournament is given below. The *Plumbers' Trade Journal* is printing a complete schedule, which will be out shortly.

We trust as many as possible will be on hand at the Monarch Palace Alleys, Sixth avenue and Twenty-sixth street, on the opening night, Monday, September 29.

First game commences at 8.15, preceded by half an hour's practice.

Monday, September 29:

*Plumbers' Trade Journal*, *The Metal Worker*, Behrer & Co.

Tuesday, September 30:

F. N. Du Bois & Co. (Apex), F. N. Du Bois & Co. (Dia.), National Lead Company.

Wednesday, October 1:

Salesmen, H. P. Read Lead Works, Manufacturers.

Thursday, October 2:

E. S. Wheeler & Co., Ronalds & Johnson Company (New York), Ronalds & Johnson Company (Brooklyn).

Friday, October 3:

John Simmons Company (No. 1), John Simmons Company (No. 2), Ashcroft Mfg. Company.

Monday, October 6:

Crane Company, Ronalds & Johnson Company (Brooklyn). Crane Company, John A. Murray. Colwell Lead Company, Ronalds & Johnson Company (Brooklyn).

Tuesday, October 7:

Jenkins Bros., E. F. Keating, Lalanc & Grosjean Company.

Wednesday, October 8:

Central Foundry Company, Ashcroft Mfg. Company, *The Metal Worker*.

Thursday, October 9:

Fred. Adee & Co., Dimock & Fink Company, *Plumbers' Trade Journal*.

Friday, October 10:

Behrer & Co., Manufacturers, Du Bois & Co. (Apex).

Monday, October 13:

Crane Company, E. S. Wheeler & Co., Salesmen.

## A FUEL OIL BURNING APPARATUS.

BY NEEDCESSITY.

I have noted the different inquiries for fuel oil burners in *The Metal Worker*, and while I do not recommend my apparatus to be absolutely the best ever proposed and the most complete and only true solution of the problem I give it for what it is worth. I needed a burner, being in a locality where there was an abundance of all sorts of juice that could be called all things, from crude to refined, and not miss it by more than half a peck in any direction. I wanted to burn this somewhat after the manner that natural gas can be burned. Now the natural gas ordinarily flows at a high pressure, needing a reducing valve, and as it hustles through the orifice it draws in an abundance of air through openings in the mixing chamber to get the desired mixture for combustion. Here was a problem for me, and here is my solution of it:

I had one of those double acting air pumps, having a cylinder about 3 inches in diameter and something less than a foot long. I hitched this up to some piping with stop cocks on it, one pipe leading to the top of the receptacle containing my fuel oil, the other leading to an old galvanized iron range boiler, which, fortunately for me, was air tight and available for use. This boiler was of about 40 gallons capacity. By means of the pump and some elbow grease I could get a pressure of about 80

pounds in my air tank, as shown by a pressure indicator hitched to one of the openings in it. I had a similar indicator on top of my fuel tank, so that it was an easy matter for me to get any pressure under 80 pounds in both oil and air tanks. I used this in connection with a burner that was placed in a round cylinder for heating a large caldron. I took a 1½-inch pipe and made a flat spiral coil. This was something of a job. I drilled this coil with a small drill to make orifices for my fuel to escape through and connected this on the outside of the fire chamber with the air and oil tanks by means of a tee connection. A jet of oil was shot through a small orifice into the tee and struck against a little cross bar that I had fastened in the tee to cause the stream to be broken up into a sort of spray, so that the compressed air coming in would carry this spray of oil forward through the coil to the orifices, where there was no difficulty in lighting it. The longer the burner was in operation the hotter it became, and this had a tendency to gasify the oil, and to give a flame of intense heat.

My gimcrack has answered my purpose, and as there are no patents on it it is open to the use of whoever may desire to make one and try it.

## The F. & M. Pipe Hangers.

Both steam fitters and plumbers are interested in convenient devices for supporting the flow and return pipes of heating and plumbing systems, and those capable of

Fig. 1.—For Steam Fitters.

Fig. 2.—For Plumbers.

The F. & M. Pipe Hangers.

adjustment are of the greatest convenience. In the accompanying illustrations we show two pipe hangers made by Fee & Mason, 68 Beekman street, New York, which have this valuable feature. The design shown in Fig. 1 is especially intended for steam fitters' use, being made for all sizes of pipe, from ¾ to 8 inches in diameter. The hanger shown in Fig. 2 is more strictly adapted for the use of plumbers. Having a grooved stem it is capable of an adjustment of about 3 inches. This is made for all sizes of pipe, from ¾ to 2 inches. Circulars giving full particulars of these goods have been issued by the makers.

"I HOPE YOU WILL TURN ME OVER BEFORE YOU TURN ME DOWN," is printed on the address side of a mailing card issued by the Judson A. Goodrich Company, 105 Beekman street, New York, and which states that S. D. Bruce will shortly call on the trade to which it is sent, in the interests of the high grade Steam Specialties made and handled by the house, including the Floor and Ceiling Plates of the Beaton & Bradley Company and the extensive line of Water Seal and Automatic Air Valves made by the company.

THE ECONOMY STEAM RADIATOR.

In the accompanying illustration is shown the Economy steam radiator, designed for heating rooms, and made in portable form so that it can be readily taken from one room to another. This radiator, which is made by the Water Heating Mfg. Company, 211 Fifth street, Milwaukee, Wis., consists of a small boiler heated by gas until steam is generated, which fills a series of pipes, presenting a large radiating surface and increasing the efficiency of the radiator. It is so arranged that the steam condenses and the water runs back into the reservoir or boiler to be reconverted into steam. The burner consumes about 12½ feet of gas per hour, and when turned on full will in a short time raise a full head of steam and heat the radiator. After this, the generation of steam can be continued with the burner supply shut off

The Economy Steam Radiator.

so that the consumption is but one-third. It is claimed that on account of the steady heat the radiator is capable of heating two fair sized rooms to a comfortable temperature in midwinter. The radiator is finished in three styles, with a black enamel body and trimmings, with bronze trimmings, or with nickel trimmings. When furnished with bronze trimmings the whole radiator can be finished in gold, silver or aluminum bronze, as desired.

A SHOP TIME SYSTEM.

The system used for keeping track of men's time in jobbing by L. H. Toucey & Co., Waterbury, Conn., while simple, answers the purpose very well. Time tickets, measuring 3½ x 6 inches, such as are shown in Fig. 1, are placed in the shop so as to be of easy access to the men. When sent out on a job the mechanic takes one of these tickets, writes on it the name of the house or building where the work is to be done, and on the next line writes his own name. On returning to the shop he fills in the number of hours the work has taken, the name of his helper, if he had one, the number of hours he spent on the work and the date. Below this he places a list of the material used. Should the job require any work in the shop the time so spent is noted and is placed in the space provided for it at the bottom of the slip. It will be seen that a separate slip is made out for each job.

These slips are placed in a box provided for them and are collected and taken to the office each night. From the information given on them the charges are made and the time of each man recorded.

The system used in recording the men's time is shown in Fig. 2. This card is tacked on the wall directly over the bookkeeper's desk. On it is a list of the names of the

A Shop Time System.—The Time Card.

men employed in the shop and the days of the week. Each morning the bookkeeper takes the time tickets of the previous day, and from them marks the number of hours that each man has worked, marking an X when he has been absent. This serves as a time record for the week. At the end of the week the total hours are added up and the workman is paid according to the time recorded. Should any mistake be made during the week the man has an opportunity of calling attention to the fact, as this time card is placed where he can

| NAME           | Mon. | Tues | Wed. | Thur. | Fri | Sat. | Total |
|----------------|------|------|------|-------|-----|------|-------|
| <i>Joe</i>     | 9    | 9    | 9    |       |     |      |       |

Weekly Time Record.

see it at any time. After the wages have been paid a fresh piece of ruled paper is pasted over the record of hours worked and the same system followed out for the next week, no permanent record or regular time book being kept. This system, it is stated, has proved itself to be very satisfactory for a shop of moderate size and has the advantage of not entailing too much red tape.

The Metal Worker acknowledges a very courteous letter from Rollin C. Wilson, acting secretary of the Plumbing and Steam Supply League, expressing the appreciation of the members for the prize of a fine fob chain, presented by The Metal Worker, for the bowler making the smallest percentage of breaks in the League bowling tournament this winter.

## SIMPLE SNAGS IN HOT WATER HEATING.

BY Q.

The "snags" one lands up against sometimes in hot water heating are peculiarly exasperating, and often because of their apparent simplicity. One's inability to give the exact reason for the non-circulation of a radiator, combined with his memory of having connected up other radiators on other jobs in the same way where they worked certainly tends to loosen his self esteem. We have had 'em, and so often, that when we meet a man who tells us he never has a failure, everything lovely every trip, we think of that ancient fish story and reflect that we are sometimes "something of a liar" ourselves. This is not intended as a solo, entitled "How Smart We Are," but merely short plain accounts of "Snags We Have Met and How We Met Them."

If you are looking for dividends from hot water heating work it is essential that the labor account be carefully looked after. See that the workmen have no pet theories of their own to exploit, and so consume your time in that or other undesirable ways. It is not enough that changes be made in work that will

Simple Snags in Hot Water Heating.

correct faulty circulation. The alterations should be made on the simplest, not the most elaborate, plan. It is here that thought plays a most important part, and in nine cases out of ten a half hour's study will develop a plan easier, simpler and less expensive than the one of first impulse. An example of this is as follows:

The accompanying illustration shows a very common form of trouble with first floor radiators connected near a set of risers. The return of the risers backed up into the first floor radiator and stopped circulation. The fire was drawn, the system emptied and refilled before making a second test. This we consider necessary as no positive test can be made of a small job unless it is started from cold water. If it will not circulate properly and evenly from the beginning you can commence making alterations (excepting, of course, the case where an obstruction may be in the piping).

We give most of our small work a second test, to be sure about it. In this job a second test had been made, and the fitter had taken down the mains back to the heater by the time we arrived. His object was to place the tees further away from the risers to avoid the influence of the return riser. On the ground that the return is many times more often the defaulter than the flow the fitter was wrong in taking down the flow main. The changing of position of the return tee alone would have accomplished his end just as well, if it would have accomplished it at all. However, we were in time to prevent the change costing more than necessary, and after getting the original mains up again we

took a plug out of the top of the feed section of the radiator and connected to that opening. This change could have been made in less time than it required to take down his mains. It worked admirably. We merely suggest the case as one showing the possibility of saving money on such occasions. We don't like the appearance of top connections on radiators, hence our reason for not making such connection in the first place.

Reverting to the method of curing this trouble which the fitter was about to adopt, we recall a case somewhat similar, which came up to us in February last. We had sold a heater to a man who had been a fitter, but is now engaged in other business. A friend of his had bought a house and besought this one time fitter to put in a hot water system for him. When the work was ready he tested it and found that the basement dining room radiator refused to circulate. He made a number of changes in the location of the tees, always moving them to relatively the same positions. Finally he came to us and described the case, which corresponded almost exactly to the one above shown. As there was no plugged opening in the top of the dining room radiator, and it being another fellow's job, we advised him to extend the return only back to the heater. This he did and reported the same evening that the circulation was all right. We have always found this method to work.

## Acetylene Supplies

R. Williamson & Co., 452 Milwaukee avenue, Chicago, Ill., are issuing a 200-page catalogue, having a well arranged index, devoted to acetylene gas fixtures, appliances, glass ware, brass goods and tools, that will be of interest to those who install acetylene gas plants and do ordinary illuminating gas lighting work. The first section of the catalogue presents two and three light chandeliers and church and store pendants, having several lights. These are made in a variety of styles and of the combination character, and are adapted for both gas and electric lighting. The manufacturers have a variety of particularly pleasing designs, and the glass ware used in connection with their portable table lamps, as well as their pendants and chandeliers, are particularly attractive. The catalogue shows a variety of pendants that are capable of being lowered for use as reading lamps; staple and fancy brackets made in a variety of styles and of excellent finish, hall lights and lanterns, and also lamps and lanterns for out of door use, designed to be attached to a bracket on a side wall or supported by a metal or other post in the ground.

Another section of the catalogue is devoted to an extensive variety of acetylene gas burners adapted for small lights, or for lights of a high candle-power. Acetylene burner cleaners, suitable for the various burners, are also shown. Gas lighters, tapers, wire guards for gas and electric globes, cement, mirror reflectors, shades for house lights and also for different lights for bowling alleys and billiard tables are presented, followed by hose, ceiling plates, seating rings, hooks and tubing required by the gas fitter. Pressure gauges, testing pumps, blow pipes, dies, pipe cutters, vises and tools, torches, fire pots and an extensive variety of brass fittings suitable for making up gas fixtures and for connecting gas piping and stop cocks for cellar mains complete the catalogue.

## The Kellogg-Mackay-Cameron Company Catalogue.

A new catalogue, 5¼ x 7½ inches in size, bound in a green cloth cover and consisting of 333 pages, has just been issued by the Kellogg-Mackay-Cameron Company, Chicago, Ill. On the first page are presented pictures of the offices and manufacturing plants of the company in different cities. The introduction calls attention to the extensive variety and large stock of heating appliances carried by the company, enabling them to make prompt shipments to those who favor them with their orders. The first 75 pages are devoted to boilers, including cast

iron vertical sectional boilers for steam and hot water heating, sold under the names American, Advance and Model, also the Florida, Soleil, Touraine and Ontario steam boilers of the round and horizontal sectional type. The catalogue also shows tank heaters. Under the name Tobasco, Great Northern and Kewanee, a variety of wrought iron boilers are shown adapted for all classes of work, including the high power, horizontal tubular construction. Another section of the catalogue is occupied by a variety of styles of direct, direct indirect and indirect radiators, with full details and dimensions, such as are indispensable to the constructing steam fitter. Another section of the catalogue is devoted to both wrought and cast iron pipe, and the extensive variety of fittings, cast and malleable, used in connecting the pipes for plumbers' drain pipe, steam and hot water heating and for gas piping. These goods are followed by a large and varied line of brass goods, including unions, valves, radiator valves, air valves, safety valves, gauge cocks, water columns, &c. In another section are shown draft regulators, back pressure valves and a full line of steam traps and steam appliances such as are used in the modern power and heating plant. The last section of the catalogue contains steam fitters' tools for cutting and threading pipe by hand and by power and a number of pages at the back are devoted to tables of useful information, a telegraph code and a well arranged index.

### Hartford Master Plumbers' Outing.

The first occurrence of what is intended to be an annual event was the outing and sheep bake at Lake Compounce, Conn., on Friday, September 19. This was under the management of a special committee of Hartford master plumbers, composed of B. Lyon, J. L. Purcell, W. E. Mahoney and T. E. Oakes. The Master Plumbers' Association of Hartford and the Master Plumbers' Association of New Britain joined in the outing and met at the lake. Among those in attendance were the following: S. Adams, J. F. Duffy, ex-Alderman J. I. Dunn, John L. Purcell, W. A. Murray, George S. Bull, T. F. Darling, Thomas Oakes, T. H. Langdon, R. M. Starbuck, G. Cope, Frank Ellison, Charles Denton, M. Hogan, W. B. Hogan, B. Lyon, President Health Board Edward Mahl, George Mahl, T. McGrath, Plumbing Inspector John H. Maloy and Health Inspector Louis F. Eisele; New Britain, F. E. Burns, A. E. Weiant, Harold Damon, S. L. Hinchliffe, J. Erickson, P. Quinlan, C. H. Fay, J. A. Kelly, J. Newhoff, O. J. Toomey, J. B. Weiant, William Emly, T. Reilly and J. A. Rising. The plumbers joined in a series of athletic contests and games and had a very enjoyable time, which culminated in a sheep barbecue and corn dinner. This was partaken of by the members and their guests, who numbered about 50, the guests including representatives of the different supply houses and members of the local Boards of Health.

### New York City Notes.

Business is good in all lines. There are many large jobs in the market and many more well under way. Jobbing and overhauling work is excellent, and when the plumbers begin to get in the money for work done all in the business will be able to buy coal this coming winter.

\*\*\*

James Armstrong seems to have got his share of the big plumbing jobs lately given out. He has the work in the Battery Place Building, occupying the block between Washington and West streets, facing Battery place. This is a large "sky scraper" and will be strictly up to date. He also has the new building for the New York Telephone Company at 346 to 352 West Seventeenth street and a new business building on the site of the famous A. T. Stewart mansion at the corner of Fifth avenue and Thirty-fourth street, which is owned and will be occupied by the Knickerbocker Trust Company.

\*\*\*

O'Brien & Ryder are working on one of the largest factory buildings down town, the Butterick Building,

which takes in the block of Macdougall, Spring and Vandam streets. Byrne & Murphy are busy in some business buildings being put up by Henry Corn at 474 and 476 Broadway, running through to Crosby street; at the corner of Fifth avenue and Fourteenth street and at the corner of Fifth avenue and Eighteenth street. They also have work in loft buildings at 193-197 Centre street and at the corner of Thirteenth street and Ninth avenue.

\*\*\*

J. J. Kuhn is busy with eleven private houses on 137th street between Seventh and Eighth avenues, and M. Hughes has four private houses in this same block. W. G. Cornell is plumbing the stable and storehouse of the Siegel-Cooper Company, at 249 to 255 West Seventeenth street, running through to Eighteenth, and also the bank building at the corner of Wall and Pearl streets.

\*\*\*

James Fay has his various school jobs in the different boroughs so well under control that he is taking his first vacation in 15 years. He is making a trip to the "old country." Mr. Fay is expected back about November 1. Just before leaving he obtained the contract for the Morris High School, at Boston avenue and 166th and 167th streets.

## Heating and Plumbing Notes.

THE British Institution of Heating and Ventilating Engineers are holding a two days' meeting in Birmingham, England, this week.

THE JUDSON A. GOODRICH COMPANY, 105 Beekman street, New York are sending to the trade several circulars that are of special interest at this season. One is devoted to several styles of automatic air valves adapted for both steam and hot water plants and for vacuum heating systems. Another circular is devoted to a variety of styles of Globe, Gate, and Radiator Valves.

THE CLEVELAND STEAM FITTING & SUPPLY COMPANY of Cleveland, Ohio, have the contract for installing a Webster system of heating in the plant of the Hill Clutch Company in that city.

WILLIAM HAAS, 57 Grand street, New York, makes an improved Pipe Cutter, in three sizes, capable of cutting pipe up to 6 inches in diameter. The Cutter is constructed to encircle the pipe and has a tooth cutter so arranged in relation to rollers as to enable the Cutter to be run around pipe in a true line. It is said to leave the ends of the pipe perfectly square and without a burr.

THE R. C. MCCLURE COMPANY, Syracuse, N. Y., are sending to the plumbing trade a desk blotter intended to remind them that the concern carry a complete line of Plumbers' and Steam Fitters' Supplies, which fact is further impressed upon those who receive the blotters by the handsome half-tone engraving, giving a view of the fine goods displayed in the company's show-rooms.

THE L. J. MUELLER FURNACE COMPANY, Milwaukee, Wis., are sending to the steam fitting trade several circulars and pamphlets. One of 20 pages is devoted to Air Valves, Altitude and Steam Gauges, Expansion Tanks, Pipe Covering, Hot Water Storage Tanks, Back Pressure Valves, Steam Traps, &c. Another is devoted to Hot Air Furnace Fittings, such as Partition Stacks, Register Boxes, Shoes and Boots, Elbows and Dampers. Another folder contains a price-list of the company's Hot Air Furnaces and Combination Heaters. A little pamphlet is devoted to the Milwaukee Draft Regulator, designed to be used in connection with all kinds of heating apparatus for keeping a steady fire and an even temperature in the building in which it is used. Another circular shows, by means of general and broken views and by views of different parts, the construction and fire and water travel and the features of merit of the Mueller Steam and Hot Water Boilers.

THE AMERICAN BLOWER COMPANY, Detroit, Mich., are building an addition to their plant, consisting of a machine shop, 50 x 60 feet. They are also adding a

third story to a part of the old plant. The additions will cost about \$6000.

T. MCGARR, secretary of the New York State Commission of Lunacy, Albany, N. Y., will receive bids until October 15 for a ventilating system for the north wing of the main building and for plumbing improvements in the branch infirmary at Albany, N. Y.

THE patrons of the York Steam Heating Company, York, Pa., have been informed that the rates will be advanced 10 per cent. over the rates of last year.

A COMMITTEE of master plumbers in Richmond, Va., are making arrangements for a convention of the Atlantic Division of the Master Plumbers' Association, which comprises the master plumbers in several coast States.

THE plumbers of Bay City, Mich., have decided to stop putting goods in that have been purchased by customers outside of the State. They hold that the plumbers should have the opportunity of making a profit on the goods, to help compensate them for the knowledge of their business required in installing them, in addition to payment for their labor.

THE daily papers of Kansas City, Mo., report that a strike among the local plumbers went into effect on September 17.

THE BUCKINGHAM-ROUTH COMPANY, New Haven, Conn., are installing five Ideal Boilers in a block of buildings for Ernest Wadewitz, and also an Ideal Boiler in the residence of Prof. Henry Farnam in New Haven.

A FIRE doing extensive damage visited the Duquesne Sanitary Company, 226 Second avenue, Pittsburgh, Pa., last Saturday. The building is six stories in height, and before the fire was under control the fourth and fifth floors were completely destroyed, with the stock. The damage to the building and the stock is estimated by the company at about \$75,000, which is partly covered by insurance.

THE GARNETT VALVE COMPANY, 40 Dearborn street, Chicago, Ill., are sending to the trade a 16-page pamphlet devoted to the Bigelow Self Closing Basin Faucet, which has no springs or packing; does not pound; never drips, and closing with the pressure is simple and easy in operation. A sectional view renders the merits of the Faucet readily understood.

MUSTEE BROTHERS, 204 Cedar avenue, Cleveland, Ohio, are distributing among the trade a little pamphlet devoted to the Marvel Hot Water Heater, which is designed for using gas, and can be used in connection with the ordinary boiler for storing hot water or independent of it, as convenience may dictate.

EMMETT MARTIN, Fort Wayne, Ind., is sending to the trade a four-page pamphlet devoted to the Martin Cellar Trap, which has been extensively used by the plumbing trade, and is designed not only to form a trap seal against sewer gas, but also to prevent sewage or back water entering a cellar.

A VACUUM steam heating system will be used in the City Hall at Brockton Mass.

THE PITTSBURGH HEATING & VENTILATING COMPANY have awarded the contract for the erection of their new plant at Wheeling, W. Va.

JAMES COOPER, Denver, Col., has bought the electric lighting plant at Glenwood, and will establish a steam heating plant.

HIPSKIND & HIPSKIND, Wabash, Ind., have the contract for installing the steam heating system in the factory of the Rockwell-Ruple Company in that city.

F. KNAPP has taken out a permit for building a plumbing shop at 64 Foote street, New Haven, Conn.

A CATALOGUE recently issued by Gorton & Lidgerwood, 96 Liberty street, New York, which is devoted to the Gorton Side Feed Boilers, will be of especial interest to those who install heating plants at the present time, owing to their being especially adapted to burn soft coal. The catalogue presents a broken view of the Boiler, showing the construction and operation; also full explanation of the details of dimensions, with prices. It also contains illustrations of the boiler connections in

a number of buildings in which the Gorton Boilers have been used, including a view of the Yale Club Building, New York, with a plan of the basement showing the arrangement of the piping system for supplying the heat to the indirect radiators used in the building. The catalogue also shows views of greenhouses in which Gorton Boilers have been used, and contains a number of testimonials, which in themselves give a great deal of information about these Boilers.

THE COLWELL LEAD COMPANY, 61 Centre street, New York, issue a little pamphlet devoted to Lead Cames and Glaziers' Solder. It also shows Pfeiffer's Automatic Benzine Soldering Iron.

THE VANDERMAN PLUMBING & HEATING COMPANY, Willimantic, Conn., have the contract for installing the heating and ventilating system in the new Normal School building in that city.

PATRICK J. DONOVAN of Rochester, N. Y., who was sued by the Master Plumbers' Association of that city, has appealed his case from the Municipal Court to the County Court.

A COLORED plumber of Savannah, Ga., was fined \$50 for doing unsanitary work. The court ordered \$25 of the fine to be remitted, providing the work was remodeled and done properly.

THE Department of Indian Affairs at Washington, D. C., will receive proposals until October 9 for a steam heating and electric lighting plant and a sewerage and plumbing system for the Indian School at Fort Totten, N. D.

THE Board of Health of Trenton, N. J., have taken action to secure conformance by the United States Government, which is erecting a post office building in that city, to the local plumbing regulations, which require that those who have plumbing work done shall file a plan of the proposed work.

"BUSINESS STEAM" is on the address page of a rather unique folder of green paper, printed in green ink, issued by the Thatcher Furnace Company, 240 Water street, New York, calling attention to the Empire, Comfort and Thatcher Steam and Hot Water Heaters. Wherever these folders are distributed they cannot but increase the interest of those who receive them in this method of heating buildings.

THE STEEL CLAD BATH & METAL COMPANY of Toronton, Ontario, are sending a little pamphlet to the plumbing trade, devoted to their Steel Clad Bathtubs and Combination Fixtures. Some of the Tubs are shown mounted on trucks so that they can be readily removed, and others are arranged with a wash basin for use in connection with them.

THE galvanizing department and warehouse of the Harrisburg Pipe & Pipe Bending Company, Harrisburg, Pa., were destroyed by fire September 20, entailing a loss of about \$25,000.

BAKER MFG. COMPANY, Evansville, Wis., have done a large business this year in Wind Mills, Pumps, Tanks and Feed Grinders, their sales for the first eight months exceeding those of any previous entire year in their history. Just now they are increasing their capacity by the erection of an additional building, which will be 90 x 140 feet.

THE STANDARD CARBOLITE LIGHTING COMPANY have bought about 100 acres near the village of La Salle, a suburb of Niagara Falls, and will there establish the Gas Generator factory and model town projected by the company. The Generator to be made by the company is for acetylene gas. The town to be established will be lighted by this gas and will have its individual conveniences of every form, in order that it may be a model for other places to follow.

THE WESTERN TUBE COMPANY, Kewanee, Ill., are making the Kewanee Combination Brass and Iron Ground Ball Joint Union. A circular illustrates the Union, the thread end of which is brass, the ring and bottom end being malleable iron, thus making the screw connection with different metals.

### New Firms and Changes.

THE POWELL-WOOD FILTER COMPANY have been chartered at Wheeling, W. Va., with a capital stock of \$50,000, to manufacture a patent Water Filter. The incorporators are William R. Powell, Charles P. Wood and W. W. Dermott.

THE LORAIN HEATING & MFG. COMPANY have been incorporated at Lorain, Ohio, with a capital stock of \$10,000, by A. Babcock, Jr., C. E. Krantz, F. C. Whitmore, J. S. Mead and S. W. Baughen.

CHARLES H. MORSE, who has been conducting a plumbing business at the south end of Gardiner, Maine, has closed his business and secured a position as chief plumber in the National Home.

THE SHIRLEY RADIATOR & FOUNDRY COMPANY, Shirley, Ind., have incorporated with a capital stock of \$50,000, for the manufacture of Steam and Hot Water Radiators and to do a general foundry business. They have a building, 75 x 250 feet, under construction and will erect another foundry the same size, making when completed a plant 75 x 500 feet. The plant is located in close proximity to the crossing of the Peoria & Eastern and the Cincinnati, Wabash & Michigan railroads, giving excellent shipping facilities to all parts of the country. The officers are: Robert Martindale, president and treasurer; Thomas J. Markey, vice-president and general manager, and W. W. Knight, secretary.

By authority from the Secretary of State of Illinois the American Tank & Fixture Company, Chicago, have changed their name to Acorn Brass Mfg. Company and increased their capital stock from \$50,000 to \$200,000. The company have acquired the property and good will of the Acorn Brass Works, assuming all indebtedness, and will continue the business of the constituent companies at 51 North Peoria street, Chicago. Since May 1 the Acorn Brass Works have been occupying much enlarged quarters on Fulton street, extending from Green to Peoria.

C. F. HAYDEN has purchased a half interest in the Plumbing, Sheet Metal working, Stove and Tinware business of A. D. Olmstead & Co., at Brewer, Maine. C. E. Jordan retires from the firm, and the business will be continued at the old stand in Penobscot square under the same firm name.

### TRADE NOTES.

THE PHOENIX AUTOMATIC FILTER COMPANY, Racine, Wis., are sending out an illustrated circular of 12 pages descriptive of their Tracy Oil Filter. Engravings are presented showing the operation of the Filter, together with a number of testimonials from users of this device. The Tracy Filter is made in six sizes, to hold from 5 gallons to two barrels of oil. It is claimed by the manufacturers to embody an absolutely complete process of oil filtration, and it is especially recommended on account of its large storage capacity, making a combined purifier and storage tank.

U. G. FLETCHER and others of Bellaire, Ohio, are organizing the Belmont Stamping & Enameling Company, with a capital stock of \$50,000. The location of the factory has not yet been decided.

THE CHATTANOOGA WASHING MACHINE & MFG. COMPANY of Chattanooga, Tenn., have been incorporated with a capital stock of \$28,000. The company are a consolidation of the interests of the Chattanooga Washing, Wringer & Machine Company and the Southern Single-tree Company. J. A. Willard is the general manager of the consolidated company.

THE PINE MOUNTAIN MICA & ASBESTOS COMPANY of Richmond, Ind., have been organized with a capital stock of \$1,000,000, for the development of Mica and Asbestos mines in Georgia and North Carolina.

THE RIMMON MFG. COMPANY, Seymour, Conn., manufacturers of Brass and other Metal Goods, are erecting a three-story addition, 38 x 60 feet, to their factory.

THE OHIO BRASS COMPANY of Mansfield, Ohio, are having plans and specifications prepared for a new machine shop, to be 56 x 336 feet and two stories high. Upon its completion their present machine shop will be

utilized as a wareroom. They are also building a large new warehouse and a new insulation building.

SCHEELER'S SONS, manufacturers of Wire Cloth, Artistic Metal Work and Wire Goods, Buffalo, N. Y., are now having plans drawn for a large addition to their factory. The building will be 50 feet wide by 100 feet long, and will have four stories and a basement.

THE PHOENIX GALVANIZING & MFG. COMPANY, at Pittsburgh, have bought a site of land, 123 x 160 feet, formerly occupied by Kane-Maloney Iron & Steel Company, and will erect a galvanizing plant on it. The present works of the concern are on Duquesne Way, Pittsburgh, but these will be abandoned when the new plant is finished.

THE BUCKLEY-HART MFG. COMPANY have filed articles of association at Detroit, Mich. The capital stock of the company is \$40,000. The company will manufacture and sell Brass, Iron and other Metal Specialties. The incorporators are as follows: Jas. P. Buckley, Richard P. Joy, Robt. W. Hart, Henry P. Hart and S. A. King.

THE MICHIGAN BARREL COMPANY of Grand Rapids, Mich., have issued a circular to the trade announcing that their factory is now running full and that their capacity for manufacturing Refrigerators is 2000 per month. They call attention to the difficulties which it has been necessary for them to overcome because of the losses they sustained by fire July 18, 1901, and the delay in rebuilding, owing to trouble in obtaining machinery and material for manufacturing, and even after the resumption of work in February of this year they found competent labor very scarce and exacting. Hence their inability to make prompt shipments during last season. They are now, however, in position to make early shipments on orders received for next season.

THE WROUGHT WASHER MFG. COMPANY, Milwaukee, Wis., have issued a catalogue of Wrought and Steel Plate Washers, which are manufactured in any thickness or any desired size.

THE D. M. STEWARD MFG. COMPANY, Chattanooga, Tenn., and 2 and 4 Stone street, New York, have issued an export catalogue and price-list relating to Slate Pencils, School and Metal Workers' Crayons, Lava Electric Insulators, Lava Gas Tips, Acetylene Burners, &c.

THE RICHMOND CEDAR WORKS, Richmond, Va., are distributing a catalogue relating to Washing Machines, which are shown in a number of different styles. They state that their Machines are all hooped with electric welded galvanized wire hoops, which are imbedded by a patented process into grooves in the tub, clamping the staves so tightly that it is impossible for them to fall off.

THE WHEELING STAMPING COMPANY, Wheeling, W. Va., have just issued their Catalogue No. 3, illustrating Lanterns, Lamp Burners, Screw Taps, &c. The company make metal specialties along these lines to order. The early pages of the catalogue are devoted to a new line of Lanterns, the special feature of which is the one-piece stamped tube, each side of the tube being drawn from one piece of tin, joined at the edge by a seam, no solder whatever being used.

F. E. MYERS & BRO., Ashland, Ohio, have just issued Catalogue No. 37, containing 352 pages. This illustrates with list prices the firm's extensive line of Pumps, Hay Tools, Door Hangers, &c. The catalogue, with the exception of half a dozen pages devoted to Pump Tools and Fittings, is devoted exclusively to goods of their production, including a number of new articles. The catalogue will be sent to all of the firm's customers, which they refer to as numbering over 10,000 in the United States, while they also have accounts covering 25 foreign countries. In view of the growing business increased facilities will be provided during the coming year.

The longest power transmission system in the world is that in and around San Francisco, Cal. Two-phase alternating current of 60 cycles is transmitted at an electromotive force of between 40,000 and 50,000 volts for a distance of 222 miles. The Bay Counties Electric Company have been in operation for some time trans-

mitting current from their power house at Colgate to Oakland, a distance of 152 miles.

## THE PRODUCTION OF NATURAL GAS IN 1901.

The annual report of the United States Geological Survey on the production of natural gas, recently completed by F. H. Oliphant, shows that the value of this product consumed in the United States in 1901 was \$27,067,500, representing approximately 169,172,000,000 cubic feet at 15 cents per 1000 feet. This is an increase in value over the product of 1900 of \$3,368,826. Although the consumption of natural gas steadily increases, the pressure, except in the new fields of West Virginia, has continued to decline, necessitating the expense of compression in order to market an increased production from the declining fields, which expense must continue to enhance as the pressure declines and the distance to the source of supply increases. There was an important increase in 1900 in the number of iron and steel works employing natural gas as fuel, the total having risen from 33 such establishments in 1900 to 102 in 1901, a large majority being located in Pennsylvania.

### CAPITAL STILL BEING ATTRACTED TO NATURAL GAS.

During the year 1901 there was an unusual amount of consolidation of the older companies marketing natural gas, and there were organized also a number of new companies with large capital, with a view, chiefly, of utilizing the great areas of high pressure gas territory in Lewis, Harrison, Marion and Wetzel counties of West Virginia by the construction of larger and longer pipe lines, so as to market this increased production in Western Pennsylvania and Ohio. This involves an outlay of many millions of capital.

As a source of heat, light and power, natural gas is unexcelled from the moment it reaches the surface of the earth at the mouth of the well until it reaches the furthest consumer at the end of the pipe line. No preparation is necessary for its combustion, and no residue is left. It needs only to be mixed with the proper amount of oxygen. These are the facts that have stimulated capitalists to invest the money necessary to develop the reservoirs of the natural gas fields that are still holding their original pressure and volume. These capitalists are building hundreds of miles of larger lines in order to supply the towns and cities formerly supplied by nearer but now exhausted fields, and also to supply other cities that have never known the blessings of natural gas.

It has been supplying the power for a very large number of factories and operations in the gas belt, and lately it has been extensively applied in creating the power by which the natural gas itself is compressed from a low to a high pressure when the original pressure has fallen and the pipes are insufficient to deliver the necessary quantity of gas at the well pressure. A number of these compressors work up very close to 1000 horsepower, with an economy that enables 8 to 10 cubic feet of natural gas to develop a horse-power for an hour, a saving of from 40 to 50 per cent. over high duty steam engines.

The State of West Virginia has for several years furnished an increasing quantity of natural gas to Pennsylvania and Ohio; yet there still remain under the domes and arches of its rugged hills great reservoirs of it that have only been sufficiently tested by the drill to prove their existence. These reservoirs are being connected by additional lines of large pipe and will shortly supply larger quantities to localities in these States that have exhausted their own nearer reservoirs and now turn to West Virginia for a continuation of their supply.

### COMPARISON OF VALUES.

The value of the natural gas sold in 1901 was greater than that of any previous year, though the quantity was greatly exceeded when it was first introduced extensively from about 1883 to the close of 1889. During this period of six years it was used in the most extravagant and reckless manner, and it was paid for at rates that were in many instances less than one-half the price of the equivalent coal. Large quantities were allowed to escape and burn from the mouths of hundreds of stand

pipes from Saturday afternoon until Monday morning. It is highly probable that in these six years of reckless consumption four times the present production was consumed annually.

As the visible supply grew less the value became more apparent, and the appliances for consuming the gas were greatly improved after the introduction of the meter. The pipe line companies adopted more advanced methods, in securing better joints, in shutting off wells that were not needed to keep up the pressure in the mains, and in manipulating the wells themselves. By the extension of lines into newer territory they have been enabled to market increasing quantities at enhanced prices since the years 1895 and 1896, in each of which years only \$13,000,000 worth of gas was sold.

The value of the natural gas consumed in the United States in 1901 was \$27,067,500, which, at 15 cents per 1000 cubic feet, is equivalent to 169,172,000,000 cubic feet. If it were possible to store this gas in a cube, the density throughout being equal, its sides would be 5530 feet in length or 250 feet greater than the sides of a cubic mile. If 20,000 cubic feet of natural gas be taken to equal 1 ton of coal, 8,458,600 tons of coal, valued at \$3.20 per ton, would be required to yield the sum of money for which the natural gas sold. The value of the production for 1901 was greater than that of 1900 by \$3,368,826, or over 14 per cent. It exceeded that of 1899 by \$6,992,627. It may also be interesting to note that the value of the 69,389,194 barrels of petroleum produced in the United States during 1901 was \$66,417,335, and that the value of the natural gas amounted to 40.7 per cent. of the value of the petroleum for the same year.

### STATISTICS.

There were 10,293 wells producing natural gas at the close of 1901, of which number 74 were not turned into the gas mains, and 2088 producing wells were drilled in the same year; there were 453 dry holes, or nonproducers, and 1084 were abandoned. In 1900 there were 9738 producing wells, of which number 24 were shut in; 1759 wells were drilled in the same year, 359 were dry holes and 991 were abandoned. There were very nearly 800 miles of pipe laid during 1901, the mains varying from 2 up to 20 inches. This brought the total up to 21,848 miles of natural gas mains of from 2 to 36 inches in diameter in use at the close of 1901.

The increase in the value of the output of natural gas in 1901 is due principally to increased production, the advance in the general price being very slight, and is not due so much to the output from the recently developed fields in Southwestern Pennsylvania and Central West Virginia as to the enlarging of lines and the installation of gas compressors. It is this that has kept up the quantity marketed in Indiana to about the average of former years, although the rock pressure has very largely decreased. Kansas, however, has increased the value of natural gas marketed both by developing new territory and by exploiting more thoroughly that which was already known. The following figures show the output of natural gas in 1901 by States: California, \$67,692; Colorado, \$1800; Illinois, \$1825; Indiana, \$6,954,566; Kansas, \$659,173; Kentucky, \$270,871; Missouri, \$1328; New York, \$293,232; Ohio, \$2,147,215; Pennsylvania, \$12,688,161; Texas, \$7255; South Dakota, \$20,000; West Virginia, \$3,954,472; total, \$27,067,500.

Notwithstanding all the care exercised in the collection and distribution of the statistics there is a very considerable amount of natural gas consumed of which no account is rendered, as it is used universally in the oil fields for pumping wells, both in the gas engine and under the boilers, for driving gas compressors, and for supplying farmhouses and many operators in the field. There are instances, which reach from northern Central New York to Eastern Illinois, where single wells supply one or two houses, so that if it were possible to secure a complete return of the value of all the fuel displaced the figures presented would be increased by at least 10 per cent.

A total of 5742 manufacturing establishments employed gas as fuel during 1901, of which 102 were iron and steel works, 219 glass works, and 5421 engaged in other industries.

## Stove and Hardware Dealers.

LAKE'S C. O. D. STORE, Greenville, Miss., have bought the business of the Mississippi Hardware Company of that city. The stock thus acquired has been added to their own, making an aggregate of \$40,000 to \$50,000 worth of goods. The Lake concern do both a wholesale and retail business, handling Stoves and Tinware, Shelf and Heavy Hardware, Agricultural Implements, &c. They request information in regard to discounts from any manufacturers in the above lines.

W. H. HANCY, dealer in Stoves, Tinware, Hardware, Farming Implements, Hay, Feed, Seeds, &c., Claremont, W. Va., has commenced the erection of a new store building, which will be 30 x 80 feet, two stories high, with cellar; also a warehouse, 16 x 24 feet.

THE STRACK HARDWARE COMPANY, Mount Vernon, Ind., have been incorporated, with a capital of \$7000, for the purpose of conducting the Stove, Tin, Hardware, Plumbing and Heating business, the incorporators being Frank Strack, Jacob M. Harlan, Leopold Rosenbaum, Louis H. Keck, Edward E. Highman and Brad-dock McGregor.

M. SNEDEKER is successor to Riley & Snedeker in the Stove, Hardware and Farming Implement business in Hatfield, Mo.

THE DILWORTH HARDWARE COMPANY, incorporated with a capital of \$10,000, have lately commenced business in Shawnee, O. T. Their line embraces both Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, &c.

HAYRON BROS., dealers in Stoves, Tinware, Hardware, Agricultural Implements, Sporting Goods, &c., Jasper, Tenn., have sold their business to J. C. Kelly.

A. W. LEE has disposed of his Tinware, Hardware, Agricultural Implement and Sporting goods business in Cairo, Ga., to Sapp Hardware Company.

CHECOTAH HARDWARE COMPANY, Checotah, I. T., have incorporated with a capital stock of \$25,000. The company will conduct the wholesale and retail business in Stoves, Shelf Hardware, Tinware, Wagons, Buggies, Agricultural implements, Queensware, Harness, furniture, &c.

THE COUGHLIN HARDWARE COMPANY, recently incorporated with a capital of \$50,000, are successors to Coughlin-Martin Hardware Company, at Topeka, Kan., wholesale and retail dealers in Tinware, Stoves, Hardware and Miners' Supplies. T. J. Coughlin, president of the company, will manage the business.

JOHN R. COX, Stove, Hardware and Agricultural Implement merchant, Plattsmouth, Neb., has been succeeded by John Bauer.

THE G. A. PAULY HARDWARE COMPANY, St. Louis, Mo., have been incorporated with a capital stock of \$10,000 and will continue the retail business in Stoves, Shelf and Builders' Hardware, Paints, Glass, &c. The company are proprietors of two stores, one being located in the central part of the city and the other in the extreme west, and report business as very satisfactory during the past four years.

ELMER E. DEAL, Parker City, Ind., is erecting a two-story building for his retail Stove, Hardware and Tinware business.

R. B. QUIMBY has disposed of his Stove, Hardware and Tinware business in Wakefield, Neb., to K. E. Alexander, who continues at the old stand.

OREN STRATTON, Carthage, S. D., has sold his Stove, Tinware, Hardware, Sporting Goods and Harness business to James Shields and Wm. Cowell, who will continue under the style of Shields & Cowell.

THE BALTIMORE UTILIZATION COMPANY, Baltimore, Md., have been incorporated, with a capital of \$120,000, to deal in Household Goods.

THE KULENKAMPFF COMPANY have opened a fine showroom at 62 Centre street, New York, where they display Molds, Utensils and a complete line of Bakers' Supplies.

H. KADA, 33 Koikara-Suji, Kobe, Japan, dealer in Household Goods, Hardware, Tools, Cutlery, &c., advises

us that he would be pleased to receive from manufacturers of Tinware, Wire Goods, &c., for household and culinary purposes copies of their latest catalogues and price-lists.

GRIMES & EPTING are successors to Grimes & Watrous in the Stove, Tinware, Hardware, Farming Implement, Sporting Goods and Seed business in Burlington, Kan. They have erected a new warehouse of brick and stone, 25 x 80 feet, two stories, and will also erect a new store building, 35 x 105 feet, two stories, likewise of brick and stone, with plate glass front. They have purchased the lot on which the new building will stand and already have some of the material on the ground.

PETTY & SNYDER have purchased the Stove, Hardware, Tinware, Agricultural Implement, Sporting Goods, Wagon, Buggy, Harness and Paint business of H. O. Alspaugh in Cowgill, Mo.

CODDINGTON & BAUMAN have bought the Hackett Stove and Hardware establishment in Tuscola, Ill.

W. A. BARRY is successor to Barry Bros. in the Stove, Hardware and Tinware business in Downs, Kan.

W. P. & T. O. BROWN have succeeded D. B. Ashbrook in the Stove, Hardware, Farming Implement and Sporting Goods business in McFall, Mo.

W. E. PARKS has purchased the Stove, Hardware and Tinware business of Holman Bros., Marceline, Mo.

F. M. GARDNER & Co., dealers in Stoves, Hardware, Tinware, Sporting Goods, &c., Hawarden, Iowa, have been succeeded by F. F. Chladek, formerly of Tabor, S. D.

WILD BROS., Evergreen, Ala., have been succeeded by Wild-Jackson-Beaven Hardware Company, who will continue the wholesale and retail business in Stoves, Tinware, Hardware, Sporting Goods, Farm Implements, &c.

JOE MICHEL has commenced the Stove, Hardware, Farming Implement, Sporting Goods and Plumbing Supply business in Spokane, Wash. Mr. Michel is erecting a new store, which will be of brick, 35 x 110 feet in dimensions, three stories high. Its completion is expected by January 1 next.

J. C. TURNER, dealer in Stoves, Hardware, Agricultural Implements, Sporting Goods, &c., Sterling, Kan., has sold out to Houston Bros.

THE Retail Dealers' Hardware and Implement Association of Texas will hold its annual convention at Dallas, October 8, 9 and 10. The Dallas fair will be in progress at that time and the fair managers have agreed to set October 8 as Hardware and Implement men's day.

WILBUR CLARK has removed his stock of Stoves, Tinware, Hardware, &c., to a new block in Imperial, Cal., which is located in the middle of what used to be called the Colorado desert and is 70 feet below sea level. Mr. Clark's store is the first Hardware emporium in the former desert.

SIMPSON HARDWARE COMPANY, capital \$25,000, have been organized at Williamsport, N. C., by J. Paul Simpson, George W. Newell and others. They will do both a wholesale and retail business, handling Stoves, Tinware, Shelf Hardware, Agricultural Implements and Sporting Goods. They are starting in with a \$5000 stock.

J. A. BOIES & Co., have disposed of their Stove, Hardware and Sporting Goods business at Woodbine, Iowa, to Nickel & McEwen.

WESSELINK & BOEYINK have succeeded Sneller & Wesselink in the Stove and Hardware business in Sioux Center, Iowa.

DOWLING & GRANTHAM have succeeded Bressler & Hurst in the Stove, Hardware and Agricultural Implement business in Gentry, Mo.

MILROY & JOHNSON have succeeded G. W. Collins in the Stove, Hardware and Agricultural Implement business in Hopkinton, Iowa.

CARLSON BROS. have sold their Stove, Hardware and Farming Implement business in Lake Preston, S. D., to Olston & Thorsnes, who will take possession December 1 next. Mr. Olston has been identified with the sale of Farm Implements for several years past.

### The Dewees Wood Sheet Mills.

Some important improvements and extensions are being carried out at the W. Dewees Wood plant of the American Sheet Steel Company at McKeesport, Pa. These include the erection of a new iron building to take the place of the old frame building which has sheltered the mills for many years past and which was condemned as unfit some time ago. Additional ground has been acquired by the American Sheet Steel Company near the mill, on which new departments are to be erected. Three new sheet mills—two 36-inch and one

### The New Vieillard & Osswald Inclinable Press.

The new inclinable automatic press built by Vieillard & Osswald of Brooklyn is provided with a dial feed and a positive safety clutch attachment. The latter is introduced in order to guard the dies against accident. It is so designed that if, for one cause or another, the dial does not properly align the press will be automatically stopped before any injury has been done.

The operation of the device will be understood from the sketch, Fig. 2. If the dial is not in proper position the rod A will fail to enter its appropriate hole. This

Fig. 1.—The New Vieillard & Osswald Inclinable Press

40-inch—will be completed by the end of October, which will give the Wood plant a total of 16 sheet mills. All of the old mills are to be modernized, and the entire plant will be made one of the best sheet mills in the country. At the time of the strike last year the American Sheet Steel Company announced their intention of dismantling the Wood plant and transferring the mills to Vandergrift, Pa., owing to the strong spirit of disaffection which manifested itself among the workmen at McKeesport. This decision, however, was subsequently reversed and the mill was reopened. A number of improvements have been made in the plant during the past 12 months.

THE AMERICAN CAN COMPANY are erecting in Chicago a machine and blacksmith shop, 97 x 297 feet, and three stories in height.

will cause the rod D, which is carried by the same plate as the rod A, to remain in the path of the stud on the collar C and stop the rotation of the latter. This collar engages with the clutch which controls the movement of the machine.

This type of press is made in seven sizes, ranging from 500 to 5500 pounds, and is intended for shell work, such as lamps, buttons, ferrules, &c.

J. RIGNEY, P. O. Box 76, Montreal, Canada, advises us that he has been appointed Canadian representative of Hughes, Chemery & Co., Iron, Tin Plate and Metal merchants, of 54 Billiter Buildings, Billiter street, London, England, and 24 Rue Cadet, Paris, France. Hughes Chemery & Co. are the largest English exporters of Black Plate, Tin Plate and Galvanized and Black Sheet Iron to the Continent of Europe, supplying the leading

works in Germany, Holland, Switzerland, Austria-Hungary, Italy, Spain, Belgium and France. They have a factory in the last named country.

### A Useful Booklet for Roofers.

One of the most attractive pieces of advertising literature that has reached us for a long time is a pamphlet of 44 pages which is being distributed by the American Tin Plate Company with the object of impressing upon the building and roofing trades the merits of terne plates for roofing material, and especially the advantages of the M F and U. S. Eagle roofing plates, for which W. C. Cronmeyer, 1211 Carnegie Building, Pittsburgh, Pa., is the company's agent. The get up of the publication is of the highest character in regard alike to typography, illustrations and subject matter. The front cover bears a picture of a workman carrying a solder furnace and some sheets of M F tin, the outer one being an actual piece of terne plate stamped with the M F brand and carried under the man's arm in such a way that it can be slipped out for inspection. The pamphlet, which is entitled "A Fifty Year Roof, How It Is Made," contains a considerable amount of details regarding the history

Fig. 2.—Safety Clutch.

and manufacture of tin and terne plates, together with much useful technical information bearing upon the same subject. It is profusely illustrated with half-tone and line engravings showing the processes of the manufacture of iron and of tin plate and the application of tin plate to a roof, together with views of a number of the American Tin Plate Company's steel and tin plate works. Pictures are also presented of several important buildings the roofs of which are covered with M F tin. The latter portion of the pamphlet is devoted to various useful tables showing the quantity of tin required to cover a given number of square feet of flat seam roofing and standard seam roofing, the United States gauge and weights of steel sheets, net weight per box of tin plates, standard weights and gauges of tin plates, weights and specific gravity of different kinds of metal, fusibility and heat conducting power of the various metals, approximate weight of materials for roofs, wind pressures on roofs, number of slates required per square for roofs, and a large amount of other useful information regarding not only roofs but building materials of all kinds. This little work should prove valuable to all engaged in the roofing and building trades.

With the announcement that they are roofers "on bright days and dark days and on all days," Gara, McGinley & Co., 23 South Seventeenth street, Philadelphia, Pa., are sending out, in conjunction with their fall cir-

culars, a "color barometer," consisting of a card bearing the figure of a little girl wearing a dress the hue of which changes with the weather, being blue in fair weather, pink in stormy and violet in changeable weather. It is a pretty notion that should add to the popularity of the donors.

### The Horan Stay Gutter Hanger.

The Horan Stay Hanger Company, 1851 Portland avenue, Louisville, Ky., are manufacturing the patent Horan stay gutter hanger, of which illustrations are given herewith. One of the special features of this hanger is a hinge movement, which enables the adjustment of the hanger at the shop. The eave trough can then be partially nested for transportation, the hanging wire being turned down into the gutter, as shown in

The Horan Stay Gutter Hanger.—Fig. 1.—Views of Hanger and of Same Applied to Gutter.

Fig. 1. This leaves nothing to be done at the building but to drive the nails. The use of this hanger also enables the roofer to make joints in the beads of the gutter with the hanger adjusted, without catching under the eave of the roof as the gutter is turned up into position. Another strong point claimed for the hanger is that the stay wire, being adjustable, will hang single or double bead gutters, box gutters, octagon gutters, O. G. gutters, fancy cornice, or any kind of hanging eave trough. The advantage in connection with this feature of the device is that the jobbers by the use of the company's product need carry but one line of goods, and yet be in position to supply all the demands of their customers in this line, instead of, as now, being compelled to carry a stock of single bead hangers for those who are putting up single bead gutters, double bead hangers for those using double bead gutters and steel hangers for those using box or O.

Fig. 2.—View of Hanger in Place on Roof.

G. gutters, necessitating an outlay in three different lines, in order to have a complete stock. The Horan stay gutter hanger will cover all of the wants above referred to. The advantage, to the jobber especially, is obvious from an economical point of view. The hanger is formed of galvanized iron and galvanized wire, and it is said will not sag from weight, nor permit the gutter to spring from the drain line. Moreover, the galvanized iron stay, shown in Fig. 1, prevents the gutter from collapsing. In Fig. 2 are shown the gutter and hanger in position on the roof, indicating the method of application. The manufacturers claim that this is the most readily adjusted hanger on the market, and that it makes an exceptionally neat and substantial job. The hangers are made in nine sizes—namely, 3, 3½, 4, 4½, 5, 6, 7, 8 and 10 inches.

### THE TIN PLATE SITUATION.

A conference has been arranged between the Tin Plate Wage Committee of the Amalgamated Association and the American Tin Plate Company, to be held in New York on Monday, September 29. At this meeting the vote of the lodges on the matter of accepting a reduction when working on tin plate for export will be definitely known. The first vote of the lodges taken some time ago was almost unanimously against accepting the proposition, but owing to the appeals of President Schaffer and other officials of the Amalgamated Association, together with other influences that were brought to bear, many of the lodges that voted at first against the reduction have since voted in favor of accepting it, and it now looks as though enough lodges will vote in favor of the proposition to carry it. The American Tin Plate Company will be represented at the conference by Warner Leeds and the various district managers.

### A Severe Spinning Test.

We illustrate herewith a design spun by the National Stamping Works of Chicago from one piece of No. 22 gauge Ryerson's extra deep stamping and spinning steel furnished by Joseph T. Ryerson & Son, Chicago. The steel used for this work was not annealed. This piece of work stands about 12 inches high, and is 10

*A Severe Spinning Test.*

inches across the largest diameter. President Frank Kohlhasse of the National Stamping Works says that in all his experience he had never seen a steel sheet that would stand this difficult test; that, in fact, the material seemed to work fully as easily as brass. This is a gratifying testimony to the quality of the Ryerson material.

### FLASHINGS.

A REPORT current on the New York Stock Exchange to the effect that the United States Steel Corporation have acquired 60 per cent. of the stock of the American Can Company has received an unqualified denial from the officials of the Steel Corporation.

THE C. W. HUNT COMPANY, Pittsburgh, Pa., have been awarded a contract by the American Sheet Steel Company to install a complete coal handling plant in the new boiler plant which the company are building at Leechburg, Pa.

HOLBROOK & Co., with principal office at 45 Montgomery street, Jersey City, N. J., have been incorporated with a capital stock of \$100,000 by Joseph L. Rusling, Giles J. Holbrook and Arthur M. Holbrook, to manufacture Roofing Materials.

THE STANDARD TIN PLATE COMPANY of Canonsburg, Pa., have been incorporated with a capital stock of \$300,000, for the purpose of erecting Tin Plate works. S. A. Taylor, I. R. Mason, Jr., and W. I. Berryman are the directors.

THE buildings for the new plant of the Marietta Sheet & Tin Plate Company, Marietta, Ohio, have been completed and the work of erecting the mills is now being carried on. The entire plant will not be in condition for complete operation for some months to come.

GARA, MCGINLEY & Co, 23 South Seventeenth street, Philadelphia, Pa., call attention, by means of a leaflet,

to the fact that they are equipped to do all kinds of Architectural Sheet Metal work, as well as roofing. Among the notable buildings in Philadelphia on which the firm have done the sheet metal work are the Fidelity Fire Assurance Building, the Philadelphia Bourse, the Pennsylvania Railroad Company's train shed, the Hotel Lafayette and the Betz and Drexel buildings, also the Union Terminal Station at St. Louis, Mo.

THE Tin Plate plant of the N. & G. Taylor Company at Cumberland, Md., which was recently closed down on account of a strike of the annealers, picklers and openers, is reported as likely to remain idle for some little time.

THE McILROY-JENNINGS CORNICE WORKS of Chicago, Ill., have been incorporated with a capital of \$6000 by M. L. Jennings and J. M. McIlroy. The company will engage in the manufacture of Sheet Metal Cornices.

THE MILWAUKEE CORRUGATING COMPANY, Milwaukee, Wis., have furnished us with specimens of the attractive advertising matter which they are sending out in the interests of Kuehn's Patent Rain Water Cut Off, the Eclipse Wire Eave Trough Hanger and the Adjustable Steel Eaves Trough Hanger. A circular refers to Steel Ceiling Sheets, painted and galvanized, and furnished either plain, headed or corrugated; also Curved Corrugated Sheets for roofs and ceilings, awnings or architectural purposes. These Sheets are supplied either red painted, graphite painted or galvanized. The Milwaukee Corrugating Company, although new in the trade, possess the advantage of experienced management, thoroughly familiar with all the requirements in their line. Their factory being new, it is equipped with strictly modern machinery capable of producing the high quality of work now demanded.

SHIPMENTS of Tin Plates from Great Britain to the United States in the month of August, according to the British Board of Trade returns, amounted to 5011 tons, a decrease of 3500 tons from the figures for August, 1901. The total shipments of Tin Plates from British ports to this country in the eight months ended August 31, 1902, amounted to 46,156 tons, as compared with 41,369 tons in the corresponding months of 1901.

THOSE who are desirous of qualifying themselves in cutting patterns will be interested in the proposition of the Home Industrial School, Canton, Ohio, to give three lessons free, in order that students may acquaint themselves with their method of teaching, which includes instruction on some 500 problems.

THE LEWIS ROOFING COMPANY have decided to establish a factory for the manufacture of Fire Proofing in the west end of Rock Island, Ill. A new company have been incorporated, with E. W. Lewis, president; F. J. Lewis, vice-president, and J. L. Hagman, secretary. The product of the plant will, we understand, consist of Cement Tile for exterior work and Asbestos for interior fire proofing. The material is formed in molds and is dried by evaporation. It is also stated that the company will move their plant from Moline to Chicago after the lease of the ground now occupied by their plant expires.

THE JOHN SCHWING COMPANY, Bridgeport, Conn., are making the Metal Cornices for the new High School at Danbury and for the new Rowe Building in New Milford.

THE Sheet Metal worker, who is always interested in the problem of cutting the patterns for Elbows, Pipe and Miters and similar work in Sheet Metal, will be attracted by the proposition of J. M. McFarland, 718 North Grand avenue, Los Angeles, Cal., who is offering a Protractor Pattern designed to assist in this work.

THE UNIVERSAL MACHINE WORKS, Cleveland, Ohio, are distributing a large size postal card calling attention to their Patent Universal Power Pipe Tapering Machine for swedging or drawing in the ends of corrugated pipe. The machine is illustrated and described on the card.

THE six-mill Sheet plant of the Laughlin Nail Company, at Martin's Ferry, Ohio, is being operated to full capacity. In one day recently their Bar mill turned out 75 tons, the largest day's output in the history of the plant.

WHAT is said to be the largest block of Slate taken out of any quarry in the valley was hoisted at Howell's quarry, Bangor, Pa., on July 25. From it was made five squares and 43 feet of Roofing Slate. Two squares and 94 feet were made into 12 x 24, 127 feet into 18s, 20s and 22s, the balance being made up in smaller sizes.

A NUMBER of improvements are being made at the Struthers works of the American Sheet Steel Company, at Struthers, Ohio.

As the result of the abandonment of the Irondale, Ohio, Tin Plate mills of the American Tin Plate Company some months ago, it is stated that that city is soon to have a new two-mill Tin Plate plant. The withdrawal of the first mentioned concern has so affected the business of the town that the leading merchants have subscribed to a new company, to be known as the Irondale Tin & Sheet Mill. The company will shortly be incorporated, and will locate in the old Furnace Hall plant, which includes 80 acres of land and a large building.

THE PITTSBURGH WORKS of the American Tin Plate company at New Kensington, Pa., have been shut down for an indefinite period.

THE ALLEGHENY STEEL & IRON COMPANY of Pittsburgh, with Sheet mills at Tarentum, Pa., have bought from Wickes Brothers of Pittsburgh a vertical water tube boiler of 350 horse-power.

GEORGE CALLAHAN & Co., 218 Front street, New York, have been supplying the United States Government with their Rubber Roof Cement, used in connection with the fortifications on the New Jersey Coast, and refer to it as having given excellent results. They have now received large additional orders for the Sandy Hook, Willet's Point and West Point Government works, now in course of construction. This concern also manufacture a Steam Joint Cement.

THE ENAMEL STEEL TILE COMPANY of Bellaire, Ohio, are nearing completion of their plant. The factory and equipment will be modern in every detail, and the company state that a high class of Enamel Steel Tile will be offered in a few weeks. This Tile will be made in the various sizes, colors and designs, requires no repainting, and will not fade or craze. The officers of the company are as follows: J. F. Du Bois, president; W. H. Landkrohn, manager; J. W. Garber, secretary and treasurer.

PROSPERITY LODGE of the Amalgamated Association, composed of employees of the La Belle Works of the American Tin Plate Company of Wheeling, W. Va., have voted in favor of accepting a reduction of wages when working on Tin Plate for export. A former vote of this lodge was against this proposition.

THE U. T. HUNGERFORD BRASS & COPPER COMPANY, 497-503 Pearl street, New York, have opened a branch office at 510 Arch street, Philadelphia, in charge of three of their most competent people who thoroughly understand the Brass and Copper business, for the purpose of increasing their sales in Philadelphia and surrounding territory. No stock will be carried at that point, but as they continually have on hand at their new headquarters in New York a well assorted stock of about 1,000,000 pounds, shipments of which can be delivered in Philadelphia and nearby points within 24 hours after receipt of order, they do not believe it will be necessary to carry a stock there.

A rather good, or bad, story is told by a writer in *Cassier's Magazine*, illustrating the remarkable methods of the executives of some of the trades unions in dealing with their members. It appears that while a workman was engaged in guiding a cable into a conduit in a building that was being wired his fingers were caught between the cable and the walls of the conduit. The men at the far end of the conduit, unaware of their comrade's plight, continued to pull upon the cable, seeing which an apprentice lad ran to his assistance and pulled back the cable. A delegate of the union who had witnessed the affair and had expressed sympathy for the sufferer reported him for violation of the rules of the order, and the latter was called to executive headquarters to explain his conduct. Notwithstanding that his fingers bore evidence to the ex-

tent of the accident he had undergone, he was fined "for allowing an apprentice to do helper's work—to wit, assisting a journeyman drawing wire into conduits."

### United States Patents.

The report of the Commissioner of Patents for the year 1901 shows total receipts of \$1,449,398 and expenditures of \$1,297,385, leaving a balance of \$152,012, which goes to a surplus fund already amounting to \$5,177,458. At least one department of the Government is self supporting. The total number of applications requiring investigation was 52,912, and the total number of patents issued was 27,292, so that nearly 50 per cent. of the applications were rejected. According to the statistics Connecticut leads in inventive genius, having obtained one patent to every 1198 inhabitants. Then comes District of Columbia with 1296; Massachusetts is next with 1472, and then New Jersey with 1572. North Carolina and Mississippi require over 18,000 citizens to think up one invention, while in South Carolina the number is over 28,000, and in Alaska over 31,000. Of foreign countries Germany comes first, as 1045 of her people took advantage of our patent laws. England is next with 986, then Canada 376, France 306 and Austria 156.

### New Publication.

**The Manual of Business.** Compiled by Sidney P. Johnston. Size, 5 x 8 inches; 264 pages. Published by Daniel Stern, 69 Dearborn street, Chicago, Ill.

This volume, which has just been issued as an addition to the series of *American Artisan* manuals, contains a collection of correct business forms for executing all commercial instruments, commercial data and advice on the thousand and one questions which constantly arise in everyday business life. The contents have been compiled from various sources and cover a wide field, as will be seen by the headings of the various chapters, which are as follows: Penmanship and commercial correspondence, bookkeeping, debts and collections, bank and commercial papers, contracts, notes, patents, measurements, public roads, postal regulations, discount and interest, property, real and personal, transportation, rights of clearance, parliamentary rules and forms of resolutions, dictionary of business terms, business abbreviations and business maxims. The book is intended to be a ready reference work bearing on forms of business usage and will doubtless find a useful place on the desks of many business men.

### The Dandy Electric Carpet and Clothes Whip.

The carpet and clothes whip illustrated herewith is made of rattan reeds  $\frac{1}{2}$  inch in diameter, rendering it

*The Dandy Electric Carpet and Clothes Whip.*

light and durable. It is put on the market by the Theo. J. Ely Mfg. Company, Girard, Pa.

The American Foundrymen's Association have issued as a souvenir of their seventh annual convention a cloth bound volume containing a report of the proceedings at the Boston meeting on June 17 to 19, 1902. The volume contains all the papers presented at the convention, a stenographic report of the discussions and action on resolutions, numerous illustrations of points of interest in Boston and photographic reproductions of interesting occurrences which took place during the excursions of the association to various points in Boston and vicinity. The volume has been prepared by the secretary, Dr. Richard Moldenke, P. O. Box 432, New York City.

# THE LETTER BOX.

*Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.*

*Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.*

## WANTS HELP TO HEAT A SCHOOL.

From C. A. S., New York.—I have prepared the following for the assistance of "C. S.," whose inquiry about heating a school appears in *The Metal Worker* of July 26:

I assume that the school building should hold about 800 pupils, that 30 cubic feet of air should be allowed for each person and that each classroom should hold about 67 persons; also that the alteration has been designed to be made at a small cost. In figuring this job I have used the rules for a hot water heating job, calculating to get 175 B. T. U. from radiator, with the water at 180 degrees. As 15,594 square feet of radiation would be required for the job, using 7 pounds of coal to each square foot of grate surface, and using indirect, we have to add 50 per cent. more, amounting to 23,385 feet, and one-third more for piping, making a total of 31,326 ÷ 395 = 78 square feet of grate surface. But, taking the same as 1800 B. T. U. for each heating surface, shows that 3034.2 square feet of heating surface are required, or 38.9 square feet to grate surface of 1 square foot and 395 ÷ 38.9 = about 10.2, and 144 ÷ 38.9 = about 3.7.

There is 15,594 square feet of radiation; but as it is a furnace job, not hot water, 15,594 ÷ 10.2 = 1529 square feet of heating surface required in the furnace, and 1529 × 3.7 = 5657 square inches of grate surface. Using 7 pounds of coal to 1 square foot of grate, this will only heat 35 degrees in warm air heating, and twice this amount will be required to heat to 70 degrees standard. If, instead, 14 pounds are used to 1 square foot of grate surface twice the heat will be generated, or using 7 pounds all the way through 1529 × 2 = 3058 square feet of heating surface in a hot water boiler or grate surface equal to about 78 square feet.

In looking the market over we find there is a firm that make warm air furnaces, and if "C. S." will use eight of their apparatus, having each 191 square feet of heating surface, or a total of 1528 square feet, and grate surface of 5656 square inches and about 1300 square inches of warm air flue to each, he will have 10,400 square inches, and only 10,190 square inches is required. On the plan of the school building in the article of July 26 four ventilation flues are proposed, which is not a bad idea. But there are no chimneys for the furnaces, so the only way is to run the smoke up the center chimney and the heat from the pipe will save on the coal bill. So much is said about how stack heaters are poorly managed by those having them in charge. They should be supervised so that their work will be done properly. There are four ventilating flues, about 10 square feet each. The best average velocity that can be allowed is about 600 feet per minute, and 6030 cubic feet per minute must be carried away for the three classrooms; 6030 ÷ 600 = 10.5 square feet; 10.5 × 4 = 42 square feet for the area of the shaft. The building being about 60 feet from cellar to outlet of vent flue, and, say, 8 feet off for cellar, gives 52 feet of vent flue;  $\sqrt{52}$  = about 7.3, and 42 ÷ 7.3 = 5.75<sup>2</sup> = 33 degrees.

By using stack heaters burning 7 pounds of coal per square foot of grate and four of the warm air heaters and having them so arranged as to take air from the floor after school hours and from halls when below freezing point, and taking air from the classrooms on the first floor when above 35 degrees, and the apparatus so arranged as to be able to throw all the heat from the same to either the vent flue or the room, as desired, when below freezing point, there should be no failure to heat. As there are 70 square feet I have provided 56 square feet on front entrance. All air is to be taken from above the roof line and where it is proper, and under the impression that water heaters can

| Floor.       | Room.                    | Square feet of glass and exposure in apartments. |       |       |       | Square feet of exposed wall and its exposure in apartments. |       |       |       | Total glass. be put in every furnace one can be used with each set of heaters and four in the building. The water heaters should each be connected up to an open tank holding from 5 to 10 gallons of water, and be placed between two large heaters, with a tank on the outside to fill the tank inside automatically. This outside tank should have a ball cock connected with the house supply, to fill the tank inside of the heater casings for moistening the air. The warm air shafts should be 4 feet 3 inches by 4 feet 3 inches.

There are a great number of local details that "C. S." will have to attend to, such as hall vents, air filters, &c. After his job is complete and he makes the test, let us know how much coal, wood and paper is burnt, and the temperature of the outside air and the air in the

passes through the hot flues and it does not cost a cent to heat all the hot water that we require for domestic purposes. This may not be exactly what "A. B." inquires about, but it may, nevertheless, be of interest to him and other readers of *The Metal Worker*.

### PROTECTING PARTITION PIPES.

From C. W., Paterson, N. J.—I have seen the inquiry of "B. W." in *The Metal Worker* of September 20, and would say that the protection needed depends on the temperature of the air which passes through the pipe. If the pipes are so small that the furnace has to be run hard and the air heated to an excessively high temperature to heat the rooms there can be no doubt

Wants Help to Heat a School.

building, and full details of his test, with the time expired during the tests. The plan and elevation herewith gives some further details, and the table gives the dimensions.

### HEATING WATER WITH STEAM.

From R. B., Norwich, Conn.—In reply to the inquiry of "A. B." in *The Metal Worker* of September 6 I submit a sketch showing how I heat water for my house

Heating Water With Steam.

from a steam boiler. I have placed a coil of 1-inch pipe in the flues of the heater where the hot gases must pass over it. The coil is not connected with the steam chamber or the water section at any point. It simply

that two coats of asbestos paper afford but a slight protection. On the other hand, if the temperature of the air is low, not over 140 or 150 degrees, it is improbable that fire will ever be started for lack of insulation of the heating pipes. It is far better, however, to be on the safe side and use some form of metal lath where the pipe runs up for the mortar to key against.

### SIZES OF CATALOGUES.

From Bronson-Walton Company, Cleveland, Ohio. We have noticed your remarks in reference to standardizing manufacturers' catalogues, and we agree fully with your ideas. A medium sized concern like ours, who issue a small catalogue, often find that the jobber displaces it and is unable to find it when wanted. This would be obviated if three or four standard sizes were to rule, so that the jobber could readily file each size by itself. We believe that such an influential publication as *The Metal Worker* can do a valuable service to the trade by agitating this matter, and we assure you of our hearty support.

### VENTILATING SCHOOL HOUSES.

From M. M. N.—We would be glad to know which plan of heating and ventilating an eight or ten room, two-story stone school building with the usual size of rooms is the best where no power or fans are to be used. One method would be the gravity system with only one vent opening into each room, leading directly into separate shafts. Another method would be the gravity system with only one vent in each room leading directly into one main vent shaft, with a stack heater. Another system, where several vent openings

are made under the windows, then run under the floor and down to the foul air gathering room in the basement, thence into one-vent stack having a stack heater.

**Note.**—We should be glad if our experienced readers will give their views on this subject. Where the ventilators and flues are of the proper size, and provision is made to have them operate positively, either by means of a stack heater or heating coil from a small steam plant, it would seem that there would be little choice, provided the flues and openings were large enough to prevent drafts.

#### DETAIL FOR LAWN VASE.

From C. H. R., Catskill, N. Y.—Inclosed is a sketch of a vase which I desire to make of galvanized iron; it is to be octagon in shape, 3 feet 6 inches high and 2

Detail for Lawn Vase.

feet 6 inches in diameter at the top. Can you furnish me with full size patterns, and at what price? I desire the vase for use on the front lawn and want to put flowers in it. The shape and proportions I leave to your judgment.

**Answer.**—In the accompanying illustration is shown a 1-inch scale detail of a vase proportioned to the size desired by our correspondent, which is drawn 1-12 full size. If our correspondent will carefully follow the measurements, using the scale rule, he will have no trouble in preparing the detail, after which the patterns can be developed, using the method shown on page 116 in "The New Metal Worker Pattern Book." After the vase is soldered together it will be well to re-enforce the corners, as is shown at A, by soldering vertical strips of metal about 2 inches wide, as shown at B, the entire height of the vase. A heavy bottom should be soldered in position at a b, to receive the ground, and a tube, c-h, carried through the center of the vase to dis-

charge the surplus water. If desired, scollops can be cut on to the curved member, m n, as at c-e.

#### LAYING TIN ROOFING.

From R. J. S., Evergreen, L. I.—I am having a tin roof put on my house and ask if you will please inform me which is the best way to put it on, as there is very little pitch to it. There is a dispute between two roofers; one says to commence from the bottom and the other says to start from the top. They have requested me to write to you for information, and I hope you will inform me through *The Metal Worker* as to the best method.

**Answer.**—As our correspondent states that the roof has little pitch, the tin should be laid flat seam, each sheet locked sheet by sheet. The roof should certainly be started at the bottom, so that the rain water will pass over the seams or locks and not against them. While some roofers claim that by starting the roof at the top the solder has more tendency to flow into the seam when soldering, this is bad practice, which should not be recommended, for if the roof is flat enough so that flat seam roofing can be employed there is no excuse for not thoroughly "soaking" the seams with solder; and if the roof is so steep that the solder would flow away from the seam when soldering, then flat seam roofing should not be employed, but standing lock roofing should be used. The subject of flat and standing lock roofing is very thoroughly covered in "The Roofing, Cornice and Skylight Manual," which can be obtained from our Book Department.

#### PATTERN FOR A SHIP VENTILATOR.

From J. W., New York.—I want to make a ship ventilator with a round base and round mouth. I have tried the rule given in problem 204 in "The New Metal Worker Pattern Book," but find it will not give a satisfactory result. Rather than take up your time by a lengthy explanation, I struck out a pattern for a small ventilator and send you the first piece. You will see the way it draws back in the throat.

**Answer.**—If our correspondent will call at this office we will be pleased to show him a model of a small ventilator constructed according to problem 204, taking the piece which he sent as a basis for the pattern.

#### THE VENTILATION QUESTION.

From G. B., Iowa.—The contributions appearing in *The Metal Worker* of late in regard to ventilation have been somewhat contradictory. Now as the assertion of one contributor is as good as that of another, at what conclusion do you arrive? Would it not be this? Carbonic acid gas laden air is heavier than pure air, both being at the same temperature. But the air coming from the lungs, being warmer than the air in the room, would rise; but how far? Only a little way, for it cools the moment it leaves the person; consequently, it will soon strike air of its own temperature, when it will stop rising, and as it must be cooling all the time it will soon settle to the floor, whence it must be exhausted or the lower part of the room will eventually be laden with carbonic acid gas. Consequently we must ventilate from the floor. I should like to have the opinion of readers of *The Metal Worker* upon this matter.

The Cooper Union, New York City, opened on Monday evening with all classes full and about 800 more applicants for admission than could be accommodated. Nine hundred and thirty persons made application for admission to enter the first year's scientific course, of whom only 150 could be admitted. The total registration in all classes in the institution is about 3000.

Thomas B. Stewart, for many years a manufacturer of metals and grates at 21 East Seventeenth street, New York City, died on September 20 at his summer home at Upper Dam, Maine, aged 73 years. Mr. Stewart was a native of Ireland and came to this country in 1850. He was the father of Perez M. Stewart, Superintendent of Buildings of New York City.

# TRADE REPORT.

## MARKET SUMMARY.

**Pig Tin** is dull and weak, and has declined about  $\frac{3}{4}$ c.  
**Copper** is quiet with a weakening tendency.  
**Pig Lead** is in fair demand; prices are firm and unchanged.  
**Spelter** is strong, with a light demand and continued scarcity of spot metal.  
**Antimony** is quiet and about  $\frac{1}{8}$ c. lower.  
**Nickel** is in moderate demand at unchanged prices.  
**Aluminum** continues active at former prices.  
**Tin Plates** are very dull, but without quotable change.  
**Sheets** are rather dull and weak, but without material change in prices.  
**Scrap Iron** is very strong and a shade higher.  
**Scrap Brass and Copper** are weak and dull.  
**American Foundry Iron** continues very scarce at nominal prices.  
**Sheet Copper** is in fair demand at unchanged prices.  
**Sheet Zinc** is moderately active and firm in price.  
**Hardware** is moving actively, with prices firm in nearly all lines.  
**Plumbers' Supplies** are in good demand and prices are well maintained.  
**Wrought Iron Pipe** is active and firm in price.  
**Cast Iron Soil Pipe and Fittings** continue exceptionally active demand; prices will probably be advanced October 1.  
**Solder** has declined  $\frac{1}{4}$ c. per lb.  
**Winter Goods**, such as Coal Hods, Dampers, Stove Pipe, &c., are in very heavy demand, with prices firm.  
**Dripping Pans** are firm and somewhat higher.  
**Lamps and Lanterns** are moving in large volume at former prices.  
**Wire Nails** are in better demand, with prices unchanged.  
**Cut Nails** continue in fair demand at former prices.  
**Window Glass** is quiet, with no change yet announced in prices.  
**White Lead in Oil** is in good demand, with prices firm.  
**Linseed Oil** has declined 2c. a gallon; demand is active.  
**Spirits Turpentine** is strong and about 1c. a gallon higher.

## METAL MARKET.

New York, September 26, 1902.

**Pig Tin.**—Throughout the entire week the Tin market has declined steadily, owing to heavy offerings of spot and nearby delivery, combined with a very light demand. Indications from all sides point to the fact that the consumption of Tin has fallen off materially. This falling off is attributed to the unfavorable conditions prevailing in the Tin Plate trade. The market at the close was weak, with indications of a probable further decline. Jobbers' prices are about  $\frac{3}{4}$ c. lower than those ruling at the date of our last report. Straits Pig in small lots is now quoted at 26 $\frac{3}{4}$ c. to 27 $\frac{1}{4}$ c. per lb.

**Copper.**—The market for Copper continues in an extremely dull condition, and buying for home consumption is on the smallest scale. The consumption has evidently fallen off somewhat this month. Export demand is light, and at prices as low as prevailing before the recent boom. Jobbers' quotations are unchanged, Lake Ingot in small lots being quoted at about 12 $\frac{1}{4}$ c. to 12 $\frac{3}{4}$ c., and Casting Copper at 12 $\frac{1}{4}$ c. to 12 $\frac{3}{4}$ c. per lb. The market closed with a rather weak tendency, and the possibility of a further decline in prices. Exports so far this month amount to 8325 tons, while the imports have been very heavy, amounting to 3327 tons, most of which came from London. The fact that large quantities of Copper

are being received from London is looked upon as significant in the trade, especially as many reports are being sent out from that center regarding the decrease in local supplies. A sharp decline in Copper prices took place this week in the London market.

**Sheet Copper.**—Conditions in this market do not vary from those prevailing for some weeks past. A steady demand of fair volume is noted, and prices continue without change on the basis of 18c. per lb. for Sheet Copper from store.

**Pig Lead.**—The Lead market is absolutely without change. A fair business is reported, mostly in small lots, and prices are steady and unchanged. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis reports a steady market at that point with no change in prices.

**Spelter.**—In the West the market has accumulated strength and prices have advanced during the week. In this market the efforts of those in control of the situation have not been so successful, and prices remain about the same as they were last week. Arrivals here have been heavier, but spot metal is still scarce and high in price. Jobbers quote good Western brands in small lots at 6 $\frac{1}{2}$ c. to 6 $\frac{3}{4}$ c. per lb.

**Sheet Zinc.**—The demand for Sheet Zinc is of fair proportions. Prices are firm and unchanged at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

**Antimony.**—This metal is a little lower in price, and the volume of business has been rather light. Cookson's in small lots is selling at about 10 $\frac{1}{4}$ c. to 10 $\frac{3}{4}$ c. per lb., and Hallett's at 8 $\frac{1}{4}$ c. to 8 $\frac{1}{2}$ c.

**Nickel.**—No change is noted in this metal. Small lots rule at about 55c. to 60c. per lb.

**Aluminum.**—The demand for Aluminum is good and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

**Tin Plates.**—The market is dull to the point of depression, with an entire absence of any important buying. Stocks in makers' hands are said to be accumulating, notwithstanding the idleness of a large part of the producing capacity. The larger buyers are still holding out of the market, apparently with the impression that prices may be lower and also to await the outcome of the further efforts which, it is understood, the American Tin Plate Company will make to obtain from the union workmen a concession in wages on export Tin Plate labor. The retail trade has been rather dull also this week and jobbers' stocks are said to be growing to the point of inconvenience. In some cases cutting of prices is said to have been done by holders, who are anxious to dispose of a portion of their superfluous Plates. The American Tin Plate Company are still quoting for delivery up to December 1 on the basis ruling for more than a year past. Jobbers' quoted prices show no change. American Bessemer Coke Plates, 1C, 14 x 20, in moderate sized lots, delivered at New York or corresponding points, are quoted at about \$1.65 to \$1.85 per box. Welsh Tin Plates have declined 1 $\frac{1}{2}$  pence more, and are now quoted at 12 shillings 3 pence f.o.b. Swansea.

**Sheets.**—The Sheet market shows no new developments. The demand for both Black and Galvanized Sheets is of rather limited proportions. So much new capacity in Sheets has come on the market in the last six months that the present falling off in demand is very keenly felt. However, prices are saved from any radical decline by the high price of Sheet Bars and Billets. Black Sheets are relatively firmer than Galvanized, prices on the latter being rather demoralized owing to light demand and liberal supplies. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets, in small lots, at about 3.55c. to 3.60c., and No. 27 Galvanized Sheets at about 4.40c. to 4.55c.

Chicago reports are as follows: The volume of business in both Heavy and Light Sheets is liberal and the demand continues active, but with the keen competition of independent mills, who are offering freely, the market is still unsettled and prices irregular. The jobbing demand is also on a liberal scale, some dealers reporting the volume of business transacted during the last three months the largest in a like period in the history of trade, but there is a determined fight and prices are unsettled. No. 27 Black Sheets in small lots from store are offered at 3.25c. to 3.35c., Chicago, and Galvanized Sheets at 4.30c. to 4.40c. for No. 27.

**Old Metals.**—The demand for Scrap Iron continues very active, and supplies are absorbed about as quickly as offered. Consequently prices are strong and rather higher. Scrap Brass and Copper are weak and dull. Dealers are paying about the following rates for moderate sized lots delivered at New York or corresponding points:

|                                        |         |                  |
|----------------------------------------|---------|------------------|
| Heavy Copper.....                      | per lb. | 10½c.            |
| Light and Tinned Copper.....           | per lb. | 9½c.             |
| Heavy Brass.....                       | per lb. | 8½c.             |
| Light Brass.....                       | per lb. | 6½c.             |
| Lead.....                              | per lb. | 3½c.             |
| Tea Lead.....                          | per lb. | 3 c.             |
| Zinc.....                              | per lb. | 3½c.             |
| Pure Aluminum Sheet.....               | per lb. | 22 c.            |
| Cast Aluminum.....                     | per lb. | 17 c.            |
| No. 1 Pewter.....                      | per lb. | 18 c.            |
| No. 2 Pewter.....                      | per lb. | 9 c.             |
| Tin Plate, per gross ton.....          |         | to \$5.00        |
| Wrought Iron Scrap, per gross ton..... |         | \$15.50 to 16.00 |
| Heavy Cast Scrap, per gross ton.....   |         | 14.50 to 15.00   |
| Stove Plate Scrap, per gross ton.....  |         | 10.50 to 11.00   |
| Burnt Iron, per gross ton.....         |         | 9.50 to 10.00    |

## THE PIG IRON MARKET.

**NEW YORK.**—No sales of any magnitude are reported to consumers in this immediate vicinity. A good deal of foreign iron is being taken right along to meet immediate requirements, but we cannot learn that importers or consumers have placed any orders for large lots lately. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.25 to \$24.75; No. 2 X, \$22 to \$22.75; No. 2 Plain, \$21 to \$21.75. Tennessee and Alabama brands, in New York and vicinity: No. 1 Foundry, \$23.25 to \$23.50; No. 2 Foundry, \$22.25 to \$22.50; No. 3 Foundry, \$21.50 to \$22. We quote foreign Ferromanganese \$19, ex-ship.

**CHICAGO.**—No. 2 foreign Iron has been offering at about \$23, Chicago, duty paid, to arrive, but there is very little spot foreign Iron available. The few lots which are on the market are held at much higher prices—\$26 to \$27. Some consumers report that they are better supplied for current wants, some of them reporting better deliveries on old contracts. Other foundries find as much difficulty as ever, and a few have shut down or are running only a few heats during the week, because of inability to obtain enough Iron. More ample offerings of local Iron for immediate delivery are noted on a basis of \$26 for No. 2, and some sales have been made on this basis. A few sales of Southern No. 2 Foundry, ranging from carload lots to a few hundred ton lots, were made at about \$27.15. The feeling is unsettled, however, and prices vary widely. For next year's delivery the market seems steady. One sale of 1200 tons of No. 1 Southern Foundry was reported to have been made on the basis of \$21.50 at furnace for the second half of 1903. This, however, is exceptional, few consumers being willing to contract for more than the first six months. The prices current for delivery during the first half of 1903 are as follows:

|                                |                    |
|--------------------------------|--------------------|
| Lake Superior Charcoal.....    | \$26.00 to \$27.00 |
| Local Coke Foundry, No. 1..... | 23.50 to 24.00     |
| Local Coke Foundry, No. 2..... | 23.00 to 23.50     |
| Local Coke Foundry, No. 3..... | 22.50 to 23.00     |
| Local Scotch, No. 1.....       | 24.00 to 24.50     |
| Southern Coke, No. 1.....      | 24.15 to 24.65     |
| Southern Coke, No. 2.....      | 23.65 to 24.15     |
| Southern Coke, No. 3.....      | 23.15 to 23.65     |
| Southern Coke, No. 1 Soft..... | 24.15 to 24.65     |
| Southern Coke, No. 2 Soft..... | 23.65 to 24.15     |

**PHILADELPHIA.**—A large amount of trading in small lots is being done, probably for the reason that large lots are unavailable, and also because consumers do not seem inclined to make extended engagements. Most of the sales are of foreign Iron. Nearly all the commission houses are handling this class of Iron. Sales of Scotch Iron are made at \$22.50 to \$23.50, New York, duty paid,

and Middlesbro at \$20.75 to \$21.25. These prices are for lots of 100 tons. The cost of removal to consumers' yards must be added to these figures, which is about 50c. per ton for city, and 75c. to \$1 for outlying points. American Irons are unchanged from last week, and there is very little doing, except when deliveries can be made before the close of the year, in which case No. 2 X Foundry will bring \$23.50 to \$24. General quotations are practically the same as a week ago—viz., \$20.50 to \$21 for Middlesbro No. 3, on dock, and \$22.50 to \$23.50 for Scotch Iron, delivered alongside ship. American Irons are at about the same figures as last week for city or nearby deliveries during the first half of next year, and \$1 to \$1.50 more for this year's deliveries—viz., No. 1 X Foundry, \$23.50 to \$24.50; No. 2 X Foundry, \$22.00 to \$22.50; No. 2 Plain, \$21 to \$22.

**PITTSBURGH.**—The best feature of the Pig Iron situation is the fact that Coke shipments are greatly improved and are very good this week. The Pig Iron market is quiet so far as actual sales go, but prices are very firm. No. 2 Foundry Iron is strong, and for prompt delivery has sold at \$23, at furnace, equal to \$23.75, Pittsburgh.

**CINCINNATI.**—The exceptionally high price of Coke has put quite a damper on melting operations, and spot Iron, as a consequence, is not so freely in demand. Nevertheless, prices have not weakened a particle, but if anything are higher to-day than they have been. The situation is decidedly stronger in Iron for delivery after the first of the year, and while there are said to be some furnaces who are accepting a little business on the basis of \$18.50 to \$19, yet the great majority of Southern furnaces are holding, where they have stock to sell, to the basis of \$20, Birmingham, for No. 2 Foundry. For spot delivery No. 2 is quotable by reason of a small sale reported on the basis of \$23 and upward, Birmingham. We quote, f.o.b. Cincinnati, for 1902 delivery, as follows:

|                                |                    |
|--------------------------------|--------------------|
| Southern Coke, No. 1.....      | \$26.75 to \$27.25 |
| Southern Coke, No. 2.....      | 26.25 to 26.50     |
| Southern Coke, No. 3.....      | 23.50 to 24.50     |
| Southern Coke, No. 4.....      | 21.25 to 22.00     |
| Southern Coke, No. 1 Soft..... | to 26.25           |
| Southern Coke, No. 2 Soft..... | to 25.75           |
| Ohio Silvery, No. 1.....       | 29.10 to 29.60     |
| Ohio Silvery, No. 2.....       | to 29.60           |
| Lake Superior Coke, No. 1..... | 26.10 to 26.60     |
| Lake Superior Coke, No. 2..... | 25.60 to 26.10     |
| Lake Superior Coke, No. 3..... | 25.10 to 25.60     |

## CHICAGO REPORT.

**Scrap Iron and Steel.**—Receipts of all kinds continue light and dealers finding a freer outlet have advanced buying prices from 50c. to \$1 a ton on straight carload lots of each grade. For mixed grades in carload lots 50c. per ton less is allowed. The following are the buying prices of dealers in carload lots, Chicago:

|                                                        | Per net ton.       |
|--------------------------------------------------------|--------------------|
| Country Wrought Scrap.....                             | \$16.00 to \$16.50 |
| Machinery Cast.....                                    | 15.00 to 15.50     |
| Malleable Cast.....                                    | 14.00 to 14.50     |
| Stove Plate (free from burnt).....                     | 11.00 to 11.50     |
| Burnt Iron and Grate Bars.....                         | 10.00 to 10.50     |
| Sheet Iron and Hoops.....                              | 10.00 to 11.00     |
| Plow Steel.....                                        | 13.50 to 14.00     |
| Breaking Stock.....                                    | 13.00 to 13.50     |
| Old Boilers—whole (Iron).....                          | 9.50 to 10.00      |
| Old Boilers (Iron) cut in single Sheets and Rings..... | 14.00 to 14.50     |
| Old Gas Pipe and Boiler Tubes.....                     | 14.00 to 14.50     |
| Cast Borings.....                                      | 9.50 to 10.00      |
| Turnings.....                                          | 13.00 to 13.50     |
| Horseshoes.....                                        | 14.00 to 15.00     |

**Old Metals.**—A weaker tone has developed in both Copper and Brass, and the tendency of prices is downward. Offerings are larger and the demand is only moderate. Zinc and Lead continue firm at full prices. The following are the buying prices of dealers, Chicago:

|                            | Per lb. |
|----------------------------|---------|
| Copper Wire and Heavy..... | 10½c.   |
| Copper Bottoms.....        | 9½c.    |
| Copper Clips.....          | 10½c.   |
| Red Brass.....             | 10½c.   |
| Yellow Brass.....          | 7½c.    |
| Red Brass Borings.....     | 9½c.    |
| Yellow Brass Borings.....  | 7½c.    |
| Light Brass.....           | 6½c.    |
| Pipe Lead.....             | 3.70c.  |
| Tea Lead.....              | 3.35c.  |
| Zinc.....                  | 3.45c.  |
| Tin Foil.....              | 21 c.   |
| Pewter, No. 1.....         | 18 c.   |
| Pewter, No. 2.....         | 11 c.   |
| Aluminum.....              | 20 c.   |

**Old Rubber.**—The market has continued firm, with moderate receipts, and dealers are freer buyers at pre-

vious prices. The following are the quotations current in this market:

|                            | Per<br>net ton. | Per lb. |
|----------------------------|-----------------|---------|
| Garden Hose.....           | \$25.00         | .....   |
| Air Brake Hose.....        | 50.00           | .....   |
| Rubber Shoes.....          | .....           | 7 c.    |
| Rubber Car Springs.....    | .....           | 5 c.    |
| Inside Bicycle Tubing..... | .....           | 22 c.   |
| Outside Tubing.....        | .....           | 5 c.    |
| Black Rubber.....          | .....           | 4 c.    |
| White Rubber.....          | .....           | 8½c.    |

**Rags.**—Current offerings are only moderate and with a fair demand dealers continue to pay previous prices, buying Country Mixed at 75c. to 85c. per 100 lbs., Chicago delivery.

**Anthracite Coal.**—No reliable quotations can be given for any grade or size of Anthracite Coal on track. Very little, if any, that is available for sale on the open market has been received during the week, and both buyers and sellers are at sea. A nominal quotation may be made of \$12 per ton, Chicago delivery.

## THE HARDWARE TRADE.

The market reflects the advancing season, and demands for fall and winter goods are coming in more frequently and more urgently. This class of wares at the present time demands a larger degree of attention than miscellaneous lines, which, however, continue to move in fair volume. The jobbing trade are not just now placing heavy orders and are apparently sufficiently covered with the goods in stock and by orders in process of execution. There is no disposition to buy speculatively, and merchants as a rule are acting very conservatively. Manufacturers report less difficulty than some time ago in obtaining raw material, except pig iron, the scarcity of which causes much inconvenience and delay. Manufacturers generally are full of business, but some of them are more desirous of booking orders than has of late been the case. Production is going on at a great pace, but the character of the demand and consumption is such as to absorb the output of factories with little difficulty except in a few lines, principally those in which new competition has been developed by consolidations or combinations. The Shovel situation, for example, is getting decidedly unsatisfactory. In some heavy lines, of which Wire products and Wrought Pipe may be cited as examples, new makers who are in the field or about to enter it promise to subject the market to a test of its strength. Export business shows both gains and losses. In some of the markets American goods of certain lines are having difficulty owing to lower prices of goods made abroad, but in others large and varied quantities of our products are going out.

## NOTES ON PRICES

**Cast Iron Soil Pipe and Fittings.**—A meeting of the manufacturers of Cast Iron Soil Pipe and Fittings was held in New York City on Friday, September 26, at which a renewal of the agreement of last year was consummated. This agreement binds the manufacturers together for one year, beginning with November 1, and all members of the association are pledged to maintain the prices issued by the Executive Committee of the association. They are also bound to respect each others' territory and observe all regulations pertaining to freight, terms of sale and shipments. The question of issuing new prices to cover the advance in raw material was subjected to a lengthened discussion. The matter was referred to the Price Committee, with power to issue new prices in the immediate future, at their own discretion. It is understood, however, that the new prices are already agreed upon, but were not promulgated, and will not be until the delegates to the meeting have returned to their foundries. An advance of 5 per cent. will probably be announced on October 1.

**Enameled Iron Bathtubs.**—The manufacturers of Enameled Iron Bathtubs who are independent of the enameling interests which have come to be known as the trusts held a meeting in Pittsburgh on Wednesday, September 24. It is understood that a permanent organization was effected, but up to the present no confirmation

of this report has been received. The Bathtub business has been in a most deplorable condition for some time past, none of the independent manufacturers being able to obtain prices which would give them a profitable return upon their sales. If the new organization has been consummated there is no doubt that Enameled Iron Tubs will undergo an advance in price, this being particularly true of the Tubs of an inferior make which are now being marketed at a price no greater than ordinary Copper Tubs. It will remain to be seen, however, whether the organized manufacturers can control the market to a sufficient extent to prevent price cutting.

**Coal Hods, Stove Pipe, &c.**—The run on Coal Hods, Dampers, Stove Pipe and kindred goods is of larger volume than usual and prices are firmly held.

**Dripping Pans.**—The market for Dripping Pans is decidedly firm, and some of the manufacturers have recently announced somewhat higher prices.

**Solder.**—The price of Solder has again dropped in sympathy with the decline in the Tin market. Jobbers are now quoting Half and Half, guaranteed, at 18¼ to 18½ cents per pound, and No. 1 at 15¼ to 16¼ cents.

**Lamps and Lanterns.**—The demand for Lamps and Lanterns of all kinds is exceptionally brisk and above the average for the season. Prices hold at about the same as a year ago.

**Wire Nails.**—A slight improvement is noted in the demand for Wire Nails, which is expected to show further activity before long. Mills are shipping Nails more promptly. Prices are fairly maintained, small lots from store being quoted at \$2.25 to \$2.30 per keg.

**Cut Nails.**—The condition of the Cut Nail market shows no change. The demand continues in about the usual proportions, Iron Cut Nails still being scarce. Small lots from store are quoted at \$2.30 per keg.

**Window Glass.**—Stocks of Glass are generally light, but buyers are holding off until the future of the market becomes more definite. The Jobbers' Association's quotation for single and double strength Glass from store continues at 88 and 5 per cent. discount.

**White Lead.**—The demand for White Lead in Oil is good for prompt shipment, also for future delivery covering the next six months. White Lead in Oil from store is sold in moderate sized lots at 6½ to 6¾ cents per pound.

**Linseed Oil.**—On September 20 the price of City Raw Oil was reduced by the manufacturers 2 cents per gallon, making the present price for retail quantities 55½ to 56 cents per gallon. The demand is active for small lots of Oil, as stocks are low, buyers not eaning to make contracts for future delivery with lower prices expected. Stocks in manufacturers' hands are also low, as they have not anticipated their requirements for seed to any extent on a falling market. It is probable that the entire output for next month will be required to supply the hand to mouth demand, and present prices for Oil will probably rule until there is a further decline in seed values.

**Spirits Turpentine.**—The market at this point has shown additional strength during the week, with advancing prices. Jobbers' quotations rule about 1 cent a gallon higher than those given in our last report, Turpentine in small lots being quoted at 50 to 50½ cents per gallon. The advance has had a tendency to restrict buying, which has been confined to small lots. The situation is strong, both at this point and in the South, owing to the expected increase in domestic requirements next month.

**The Milwaukee Corrugating Company,** Milwaukee, Wis., are sending out a reduced discount sheet applying on their Catalogue A, covering the various lines of Roofing and Siding Materials, of which they are the manufacturers.

The interesting statement is made in the report of a railroad company recently issued that the building in their territory of numerous trolley lines had been found to have a tendency to distribute manufacturing plants as well as the population. This distribution of traffic requires additional facilities, but largely increases the

business of the steam line. At the same time the passenger interests have not suffered from the competition of the trolley line with its cheap fare. Receipts from passenger service have increased, but the average distance of hauling each passenger has slightly lengthened. The trolley has proved an important factor in relieving congested conditions in heavily populated localities, enabling manufacturing establishments to be located wherever advantages in cheap land or railroad facilities could be secured instead of primarily considering convenience with respect to the supply of operatives.

### Incandescent and Carbureted Acetylene.

Dr. N. Caro of Berlin contributed a most interesting paper to the last Eisenach meeting of the German Acetylen Verein, describing the recent advances made in burning acetylene under a mantle, and discussing the value of acetylene carbureted by being charged with the vapor of light petroleum according to the process invented by A. Heil of Frankfurt as a fuel and an ordinary or incandescent illuminant. After asserting, says the *Ironmonger*, that considerable improvements in the construction of atmospheric acetylene burners had been effected during the past year or so, Dr. Caro admitted that there were several more difficulties to be overcome. At present the atmospheric burner is still liable to fire back to the jet at the moment of being lighted or extinguished; this causes a shock and strains the weak mantle. When once lighted, however, the burners are satisfactory. They require much care in construction, and individual specimens vary greatly in economy; some needing one, others another gas pressure to give the best results. Ordinary Welsbach mantles yield efficiencies of 84 candles per foot in about 15 liter burners; but it is doubtful whether the thoria-ceria mixture is best suited for acetylene, special experiments having shown that a light of 124 candles per foot can be obtained with special mantles. The light does not attain its maximum brightness for some 20 hours, as the mantles usually sold do not fit the flame accurately; also a side prop of metal is necessary, as the burners are not annular, and this sometimes warps and throws the mantle out of its proper position. On the other hand the luminosity of the mantle does not appreciably diminish during about 200 hours.

Carbureted acetylene exhibits a striking property in that its upper explosive limit when mixed with air is enormously lower than that of pure acetylene. The highest percentage of acetylene in air which is explosive is about 65; the highest percentage of acetylene containing 50 per cent. by volume of petroleum vapor is only 9.2 per cent. Thus it follows that a much better atmospheric burner can be constructed, for a proportion of air large enough to give the hottest flame temperature can be admitted through the lower holes, even in a large tube, without the slightest fear of the flame striking back when it is lighted, put out, or burning regularly. The ignition temperature is also about 100 degrees C. higher than that of pure acetylene, and its calorific duty is 19,000 calories per cubic meter instead of 14,000. In a 10-liter luminous jet it gives 28 candles per foot, in an incandescent burner 71 candles per foot. If the acetylene is carbureted at a somewhat high temperature, and it is then exposed to cold, part of the vapor naturally condenses; but should this happen, although the calorific value of the gas is diminished its illuminating power is increased. The partially similar product known as air gas (carbureted air) loses vapor a trifle less rapidly on exposure to cold; but in that case it loses illuminating as well as heating power. There is practically no expense involved in making the gas beyond the cost of the petroleum spirit vaporized. The new product can be burnt in a coal gas boiling burner, with a very trifling alteration to the jet. Per unit of light in an incandescent burner carbureted acetylene costs a little more than the pure gas; but as a source of heat it is about 33 per cent. cheaper. Considering the experiments detailed at length by Dr. Caro, we must come to the conclusion that this invention is likely to prove of great value to the acetylene industry. At present, although acetylene is an absolutely satisfactory illuminant, it is not so satisfactory

in warming or cooking stoves; and the opponents of the gas always urge this point when the complete illumination of a country village is under contemplation. By adopting the Heil process the cost per luminous flame is somewhat raised, the cost per incandescent flame is practically unchanged; but the opportunities for obtaining a day load at the works by supplying cookers and warming stoves, and not improbably a few small gas engines, at a price and economy which were impossible previously are greatly increased.

The *Aluminum World* quotes an aluminium manufacturer as stating that Fels-naphtha soap is excellent for washing and whitening polished aluminum. A number of utensils that have come under his observation were kept in fine order by the use of this soap.

It is facetiously remarked by a local paper that a Chicago architect has finally succeeded in constructing a flat so small that in it there isn't even any room for improvement.

## DIETZ

30 and 60

### Search Lights

There ought to be a good demand for these Lamps this fall for several reasons:

1st reason.—They are such good Lamps

2nd reason.—We are advertising them very extensively in farm papers all over the country.

3rd reason.—Their appearance helps to sell them.

Order a sample lot from your jobber and insist on having our make. Our Lanterns and Lamps are always safe and reliable.

If you haven’t received a copy of our fine new catalogue, ask for it.

# Horan Stay Gutter Hanger

PATENTED.

## A REVOLUTION IN GUTTER HANGING.

### The Horan's "Staying" Points:

It is the only perfect combined Stay and Hanger on the market. Its hinge movement enables adjustment at shop. Nothing to do at building but drive nail.  
Make joints in the bead of gutter with Hanger adjusted without catching under the eaves.  
Stay wire being adjustable it will hang single or double bead, octagon, O. G., Box Gutter or any hanging eave trough. It is the easiest and most rapidly adjusted Hanger in the market and makes the neatest and most substantial job.  
It will carry more weight than any wire hanger without sagging or springing from the drain line, and is the equal in strength of the steel Hanger.  
Ask your dealer for it. If he can not supply you write us direct.

Manufactured by

**THE HORAN STAY HANGER CO.  
LOUISVILLE, KENTUCKY**

H. J. CONEN,  
Tin, Slate and Iron Roofing,  
1010 7th Street,

LOUISVILLE, KY., July 30, 1902.

HORAN STAY HANGER CO., Louisville, Ky.

GENTLEMEN:—I have used the Stay Hanger ever since it came into use and find it far superior to any Hanger in the market. It is easily and quickly applied and cannot become loose. It holds the gutter in shape and makes it easy to put them together straight and even, and being invisible from the outside gives the house a smooth, clean and neat appearance. Any tinner using your hanger once will have no other. I think it is only a matter of a short time until the Stay Hanger will be the Hanger of this country. Wishing you the success you deserve for the labor saving and durable Hanger you furnish, I remain yours, H. J. CONEN.

# The Pesky Pin Holes

are responsible for the majority of Roof Troubles.

Both pin holes and troubles are avoided when you use

## **GUMMEY'S ANTI PIN HOLE GENUINE CHARCOAL IRON PLATES**

THEY MAKE A PERFECT ROOF.

IMPORTED AND SOLD ONLY BY

**Gummey, McFarland & Co., - - Philadelphia.**

# DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

**STEEL & IRON ALUMINUM COATING CO.,  
CONNELLSVILLE, PA.**

## **THE Meurer's Metal Spanish Tile**

is made of Tin Plate, Galvanized and Aluminum Coated Steel, Copper and any Sheet Metal desired. It is better than earthen tile in that it makes a light roof, cannot crack and become loosened, once laid always remains weather tight. It makes a desirable roof from the fact that it can be laid by anybody very rapidly, it requires no solder, and the saving on labor alone renders it inexpensive to the roofer and owner; in appearance it cannot be distinguished from terra cotta tile, and constitutes a roof covering that could not but please the most æsthetic taste. Meurer's Tile is superior to all other makes for many reasons, but particularly on account of its patent lock. This is the only Metal Tile on the market that is provided with a perfectly secure lock. All others will spring apart—it is impossible for ours to do so. We make our Tile in Graduated Form also for the purpose of roofing conical or dome shaped towers. We will be pleased to send you our catalogue which describes and illustrates our Tile—a postal card will secure a copy.

**How  
to  
Make  
the  
Best  
Roof**

MF Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of MF Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

**MF  
Roofing Tin**

is heavily coated with pure tin and new lead by the *most favored* old style process. The thorough amalgamation of the coating with the surface of the black plates, effected by this process, makes the plates impervious to rust or atmospheric gases. Ask your roofer—or send for a copy of the book.

## ROOFING, CORNICE & SKYLIGHT MANUAL

describes and illustrates accurately the laying of  
 flat and standing seam roofing, country cornice shop  
 practice, including shop equipment and cornice mak-  
 ing, and the design and construction of skylights. The  
 following are some of the subjects treated upon:

### TIN ROOFING.

An article prepared specially for this book.

#### Equipment and Methods

THE ROOFING BENCH.  
 PUTTING THE TIN TOGETHER.  
 SOLDERING.  
 FLAT SEAM ROOFING IN STRIPS.

#### Flat Seam Roofing

NOTCHING AND EDGING.  
 HAND TOOLS, FIRE POTS AND SUP-  
 PLIES.  
 THE USE OF CLEATS.  
 ROSINING SEAMS, SOLDERING AND  
 COPPERS.  
 VALLEYS AND GUTTERS.  
 CONNECTING ROOF TO WALL FLASH-  
 ING.  
 FINISHING AROUND SKYLIGHTS AND  
 SCUTTLES.  
 COVERING THE SIDES AND TOPS OF  
 BULKHEAD.  
 FLASHING PARAPET WALL.  
 SOLDERING UPRIGHT SEAMS.

#### Standing Seam Roofing

EDGING THE STRIPS.  
 CLEATS FOR HOLDING THE STRIPS.  
 FINISHING STANDING SEAMS AT GUT-  
 TER.  
 CONNECTING FLASHING WITH ROOF.  
 MAKING A MITERED STANDING  
 RIDGE SEAM.  
 STEP FLASHING.

#### Flashings for Slate or Shingle Roofs

WALL FLASHING.  
 SHINGLE FLASHING.  
 PUTTING IN A VALLEY.  
 FLASHING AROUND A CHIMNEY.

#### Table of Quantity of Tin for Roofs

### "THE COUNTRY CORNICE SHOP."

Highest Grade.

HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.  
With Lever Arc, Automatic Gauge. Will cut No. 2 iron 97 inches long.

## HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel  $\frac{1}{8}$  inch thick, cut off and mitre angle iron  $\frac{1}{8}$  inch thick, and do it perfectly.

MADE.

Write for MONARCH HUB RANGE Circular.

**SMITH & ANTHONY CO.,** Boston.

## A Popular Heater.

The Glenwood Hot Water Heater is unanimously approved and praised by dealers in heating goods because of new and practical improvements, especially the one piece construction which is acknowledged a great talking point over other boilers which are made in sections and sooner or later burn out and leak at the joints.

Write for catalogue.

### GLENWOOD.

Weir Stove Company, Taunton, Mass.

## McCLURE'S Genuine Charcoal Iron Redipped Roofing Tin.
